**SETTING UP LINE SHAFTING.**—Where line shafting is driven from one end it would pay to reduce its diameter, as the amount of power carried by it decreases. It is evident that if we put 100-horse power into a shaft at one end and take off 10-horse power from each 12 feet length, there will be only 90-horse power given into the second length, 80 into the third, and so on. Then, as the resistance to torsion varies with the cube of the diameter, we can readily cipher up how much the shafting might be reduced at each coupling.

**IRON WILL,** it may be almost certainly assumed, have a very prolonged life if exposed to statical strains alone within its elastic resistance. In a long-continued state of repose under stress it perhaps gradually becomes crystalline, but with nothing like the same rapidity as when exposed to vibration. That the natural tendency of iron is to pass from a fibrous to a crystalline state is well known, and the process of transition is rapid in proportion to the amount of vibration brought to bear upon it.

**THE LOSS OF POWER.**—Start at your engine, and follow up your line of shafting, and figure up how many tons of excessive weight you have been carrying thereon, which, to keep in motion, has been at a cost of from one to five horse-power per ton weight, according to alignment of same; then follow back and cipher your loss by slipping belts, and you will be surprised to find the sum total to be more than one-half the amount of power you are using.—*Power and Transmission.*

**SPEED AND FRICTION.**—I have been asked the question, "Does friction increase with speed, or decrease?" Both. Where the speed is slow, increasing it may decrease the friction per turn; but where the speed is fast, it may be found that increasing speed increases the friction per turn also. There are two sides to almost every question, and particularly so in this case. The more viscous the lubricant, the greater pressure can be carried upon the bearing.—*Grimshaw.*

**RAILROAD AXLES.**—A special committee on railroad axles has reported that iron axles are safer than steel axles; that all cranks should have the webs hooped; that as iron cranks appear to fail after running some 200,000 miles, and steel after 170,000, it is highly desirable that they should be taken off and not again used on passenger engines, and that crank axles, properly constructed, are as strong as straight axles.

**MACHINES FOR CUTTING OVAL HOLES** for manholes and handholes are now in use in English boiler shops. It is stated that the machines will cut holes in 20 minutes that would require a day's work by a good man. This is a very great saving in large shops, and such machines should find sale here.

## Lixiviation of Silver Ores.

## Effect of Caustic Lime.

C. A. Stetefeldt, of New York City, read the following before the American Institute of Mining Engineers:

In my paper on Russell's process (*Transactions*, vol. xiii, p. 54), I mention under Sec. 10 the deleterious influence of caustic alkalis in lixiviation. Mr. Russell's recent experiments have thrown more light upon this subject, and fully explain why, in many cases, the extraction of silver by hyposulphite solutions has hitherto been a failure. If a silver ore that contains calcium carbonate is subjected to a chloridizing roasting, a part of the lime is converted into caustic lime, its quantity depending (outside of the percentage of calcium carbonate) upon the character of the ore. With an increase of sulphurets of the base metals in the ore, the formation of caustic lime will be lessened. This caustic lime reacts upon the silver in the ore in two ways:

1. If caustic lime comes in contact with silver chloride at red heat, metallic silver is formed. As this reaction necessitates a close juxtaposition of the particles concerned, it will vary materially in degree, according to circumstances, and may effect, especially with low-grade ores, only a small percentage of silver. Besides, in case the metallic silver is not actually melted, it will be readily dissolved by the extra solution. Hence, the damage done by the roasting process itself may be very slight.

## On Moistening the Roasted Ore

On the cooling-floor, and then leaching it with water, and subsequently with a solution of sodium hyposulphite, calcium hydroxide is dissolved, and reacts on silver chloride with formation of silver oxide. If the ore on the cooling-floor is sprinkled with water while still red-hot, it is reasonable to suppose that silver oxide will be converted into metallic silver. In leaching with water, calcium hydroxide is only in part removed (100 parts of water at 15° C. dissolve 0.1368 parts, and at 100° C., 0.0752 parts, of calcium hydroxide). That the caustic solution will decompose chlorides and sulphates of the heavy base metals, it is hardly necessary to mention.

In applying the sodium hyposulphite solution, the remainder of the calcium hydroxide is quickly dissolved, calcium hyposulphite and caustic soda being formed. The latter now reacts much more energetically on account of greater concentration, and seems to do the principal damage in the final result of the lixiviation process.

With our knowledge of chemistry, the above is the only statement of reactions I am able to give for this case. If we now take into consideration that silver oxide is easily dissolved by a sodium hyposulphite solution (for one equivalent of silver dissolved, one equivalent of caustic soda is set free), and that metallic silver yields to Russell's extra-solution, the question may well be asked: How can caustic lime seriously effect the final result of lixiviation, even taking it for granted that a caustic hyposulphite solution is an inferior solvent for silver chloride and other silver combinations? The fact, however, remains; and since Mr. Russell has found at Lake Valley, New Mexico, a simple remedy to overcome this serious difficulty, it is doubtful whether the true chemistry of the case will ever be investigated.

## The Principal Facts

Observed by Mr. Russell at Lake Valley are as follows:

1st. If the roasted ore, while still red-hot, was cooled by freely applying a spray of water, the final result of lixiviation was depressed about 10 per cent, as compared with treating ore that had been allowed to become comparatively cold before moistening it.

2d. In leaching the ore with water, a caustic briny liquid was obtained, holding in solution several ounces of silver per ton of ore. Two pounds of sulphuric acid per ton of ore was sufficient to neutralize the caustic and to give an acid reaction to the solution, so that the silver could be precipitated from it as cement-silver by iron. By heating the solution, the precipitation of the silver was rendered practically complete in 12 hours.

3d. If, after leaching with water, the charge was treated in the usual way—that is, first with ordinary and then with extra solution, the extra solution was of no benefit whatever; it failed to dissolve any silver left in the ore after passing through the ordinary solution.

4th. If, after leaching with water, the extra solution was applied at once, the extraction of the silver was increased from 20 to 25 per cent, as compared with the treatment by ordinary and extra solution.

Here, evidently, the cuprous hyposulphite at once neutralized the calcium hydroxide, and prevented the solution from becoming caustic. It remains to be seen whether an admixture of a soluble salt of one of the heavy base metals, or of sulphuric or hydrochloric acid, to the first wash water, or perhaps to the water used in moistening the ore on the cooling-floor, would produce the same or even a better effect than the extra solution. Our ordinary book chemistry leaves us entirely in the dark on most intricate questions of hydrometallurgy, and actual experiment remains our sole reliable guide.

## USEFUL INFORMATION.

## Filling up Cracks.

The query, "Can cracks be permanently hid by any process of filling them?" we fear must be answered in the negative.

The shop mixture which comes nearest to doing it is a putty and filling composed of dry whiting and English filling, or ocher, half-and-half, wet up stiff with japan and quick-rubbing varnish in about equal parts, and ground through the mill. Keep oil or oil paint out of the cracks.

A priming coat is necessary to liven up the dead paint, and give the putty and filling something to cling to. Let this first coat be mixed of dry lead, mixed stiff in japan and a trifle of rubbing varnish, and thinned with turpentine. Use the lead freely, but wipe it well out of the cracks. After 24 hours, putty with some of the filling used stiff, by adding dry whiting or dry white lead. After 48 hours, sandpaper any superfluous putty, dust off well, and go on with the filling or rough coats. Add to the filling say one-fifth of its bulk of ground pumice-stone or silica, which must be thoroughly stirred through the mass.

Thin with turps, and apply freely, yet smoothly, giving the finishing strokes crosswise of the direction of cracks, if they are so well defined as to break more regularly in one direction than another. Apply two coats a day, and five or six coats in all, and give three to four days to harden.

In "rubbing out" leave a good body of the filler over the wood.

Wash clean, wipe dry, and allow 24 hours for the moisture to dry out. Use quick-drying colors and varnish. The plan is to avoid elastic material as far as possible, so that the cracks and the layer of material immediately above them may be hard as flint, which insures that it cannot shrink, or be penetrated by the after coats, nor will it be liable to change from heat or moisture.

HOME MADE CANDY.—For making candy the best of granulated sugar should be used if confectioner's sugar is not, though it is but a trifle more expensive. Home-made candy not only affords amusement in the making, but is sure to be pure and wholesome. A new recipe is given for making nut candy, that has been tested. To two cups of granulated sugar and one of boiling water, add one large tablespoonful of butter. Boil till it readily candies when dropped in cold water. Then remove from the fire and stir in nearly two cups of Brazil nuts, cut up small, and one tablespoonful of Royal lemon flavoring. Pour out upon three large buttered plates to cool. Always use a silver spoon in stirring candy. Home made candy is a very desirable adjunct to the dessert, and consoles the children when deprived of the pastries and puddings that prove so attractive to them.

A WONDERFUL LIQUOR.—The African traveler, Dr. Giovanni Succi, who is at present in his native town, Forli, claims to have discovered a liquor which renders the human body independent of food and drink. In order to prove his assertion he placed himself under a medical committee who were to see that he took no nourishment for 10 days, after having drunk a few glasses of his liquor. At the end of that time the physicians pronounced his pulse perfectly normal, and in order to show that his strength had not suffered, Succi, before breaking his fast, walked from Forli to Forlimpopoli, a distance of four miles, in 47 minutes. He then placed himself at the disposal of the medical faculty of Bologna, whose opinion in the matter is not yet known. Wonderful indeed—if true.

TO CLEAN CHAMOIS.—Chamois may be cleaned in a weak solution of soda in warm water. Rub plenty of soft soap into the leather, and allow it to soak for two hours. Then rub it well until it is quite clean and rinse it well in a weak solution composed of soda, yellow soap and warm water. If rinsed in water only, it becomes hard when dry and unfit for use. After rinsing wring it well in a coarse towel and dry quickly; then pull it about and brush it well, and it will become softer and better than most new leathers.

TO REMOVE EXUDATIONS FROM BRICK WALLS.—The simplest and least expensive method for removing saltpeter exudation from brickwork, when the efflorescence is in position where the sun and wind do not have free access, is to wash it off with diluted hydrochloric or common muriatic acid of commerce. About half a pound of the acid is used with an ordinary pailful of water, the application being made with a sponge.

POLITICS.—The time may come when politics will mean all that is noble and good; when a small boy will break an apple in two and give his little sister the bigger half; when a tramp will work and a stray dog won't bite; but the day will never dawn when the fly can tickle a drowsy man's nose without getting itself disliked.

MOLDING CAR WHEELS BY MACHINERY.—The first car wheel ever made in this country by machinery was recently turned out by the Dickson Manufacturing Company at Wilkes-barre, Pa. The wheel, complete in all respects, was made in less than one minute. The ma-

chine by which the work was done is the invention of James J. Carr, of Wilkesbarre, and it seems destined to revolutionize the business of molding car wheels. By this machine more than 600 wheels can be completed in 10 hours. By the old process it requires two men one day to make 18 wheels, and then they are not complete, as the axle holes have still to be bored when the wheels leave the molders' hands. A company has been formed in Wilkesbarre, and a large amount of capital subscribed, to establish works at that place to enter largely into the manufacture of car wheels under the Carr patent.

CLEANING BRASS.—The Government method prescribed for cleaning brass, and in use at all the United States arsenals, is claimed to be the best in the world. The plan is to make a mixture of one part common nitric acid and one-half part sulphuric acid in a stone jar, having also ready a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then removed into the water, and finally rubbed with sawdust. This immediately changes them to a brilliant color. If the brass has become greasy, it is first dipped in a strong solution of potash and soda in warm water; this cuts the grease so that the acid has free power to act.

POISON OAK.—I have heard so many complaints from both old and young who have suffered from the effects of poison oak that I will give a very simple remedy that is said to never fail in curing the most aggravated cases: A handful of quicklime dissolved in water and used as a solution. Three or four applications will suffice and a cure be effected.—*Polly Larkin in Pet. Courier.*

TO CLEAN LAMP CHIMNEYS.—To make lamp chimneys beautifully clean, wash them in warm soapsuds, turn scalding water over them, wipe dry with a soft cloth, and rub with a piece of newspaper. This will give a nicer polish than can be obtained in any other way. Windows treated in the same way will be found to look much nicer than if simply washed and rinsed.

## GOOD HEALTH.

## Cold in the Head.

A cold in the head is believed by many to be "catching." In such case it must be caused by a germ which is introduced from hot, unventilated rooms, when we are weak or tired or exhausted. To break up a cold in the head it should be attended to in its earliest stages. If allowed to run two or three days it generally runs its course, in spite of all treatment. The most effectual means in the very first stages is a vigorous effort of the will. The effect of this is to establish more securely the equal circulation of the blood, which is most important. Another method is to inhale steam from boiling water, as hot as can be borne, through the nasal passages for about half an hour twice daily. This remedy is valuable in every stage of the disease. The method of applying it is as follows: Sit in an easy chair before the fire; throw a shawl loosely over the head, so that it may be folded over the head and held with one hand, leaving plenty of room for the steam. Now, with a spirit lamp boil a pint of water in an inhaling cup, with a rubber tube attached to the nozzle to convey the steam to the region about the mouth and nose. The only caution necessary is to be careful not to let the vapor escape to near the nasal passages, when there is danger of scalding them. A tinsmith will make the apparatus, or it can be bought of the instrument-makers. Still another method is to drink hot water. The Turkish bath in the first and last stages of a cold is a most excellent remedy; in the middle stage it does not do so much good. There are many drugs used to break up a cold, among them quinine, laudanum, etc., but we prefer the simple remedies before named. Most important of all is to guard against colds. This is best effected by daily cold bathing and friction, by abundant exercise, the proper ventilation of rooms and suitable clothing. To all delicate persons colds are but the beginning of lung troubles, which are dangerous in the extreme.—*Herald of Health.*

EATING BEFORE RETIRING.—The ancient prejudice against eating just before retiring is strongly and justly condemned by modern science, experience having shown it to be unfounded. There are exceptions to the rule, but few people are injured and many positively benefited by a slight repast before retiring. A glass of milk and a biscuit or cracker is better than any hypnotic drug to put one to sleep, and in most cases may be taken without fear of "nightmare" or any other form of distress. Going to bed "on an empty stomach" is a good way to invite sleeplessness and ultimate derangement of the digestive organs and general health.

THE MULLEIN PLANT.—A good deal has been written lately about the mullein plant and its efficiency as a cure for consumption. Extracts and decoctions of this plant (*Verbascum thapsus*) were recently exhibited at the Cork Exhibition, but the judges would not pass any verdict, as the chemical and physiological properties have not yet been investigated. It is under the synonym of cow's lungwort, popu-

larly looked upon as of value in diseases of the respiratory organs. In reference to the use of the above, Dr. Quinlan, of Dublin, writes to the *British Medical Journal* that three ounces of the green leaves should be boiled for 10 minutes in a pint of new milk. The liquid is then strained, sweetened to taste, and drank while warm. This dose can be repeated twice or three times a day. This high authority has no doubt of its efficacy as a curative in the earlier, and a palliative in the later, stages of pulmonary consumption. Care should be taken to use the leaves of the great mullein, known by its thick mucilaginous and woolly leaves.

THE DEMAND FOR REST.—There is an old saying that has frightened a great many people from taking the rest that nature demanded for them, "Nine hours are enough for a fool." That may be, and not too many for a wise man who feels that he needs them. Goethe, when performing his most prodigious literary feats, felt that he needed nine hours; what is better, he took them. We presume it is conceded by all thoughtful persons that the brain in very young children, say three or four years of age, requires all of 12 hours in rest or sleep. This period is shortened gradually until, at 14 years of age, the boy is found to need only ten hours. When full-grown and in a healthy condition the man may find a night of eight hours sufficient to repair the exhaustion of the day and new create him for the morrow. But if he discovers that he needs more sleep he should take it. There is surely something wrong about him; perhaps a forgotten waste must be repaired. His sleep evidently has not been made up, and until it has and he can spring to his work with an exhilaration for it he should sensibly conclude to let his instinct control him and stay in bed.—*Domestic Monthly.*

CLOTHING AND TEMPERATURE.—When we have to wear the customary dress clothing at night let us beware of draughts or sudden changes of temperature. Going from a room on one flat to one on another, especially if overheated by dancing, is dangerous in this way. It is rarely that houses are so thoroughly heated that no chill is felt when the apartments are exchanged for the hall or the staircase. Troublesome as it may be, the only safeguard is to carry with us some form of light wrap which can be thrown over the head, neck and shoulders. When we go out into the open air from a crowded entertainment, wraps should be as light as is consistent with thickness and warmth. An important point of a hostess' duty is to see that her guests' overcoats and coats are kept in a warm place, where there is no possibility of a wet mackintosh being thrown down on the shawl which a delicate visitor will wrap about throat and chest. A wrap which is thoroughly dry and warm not only feels comfortable, but acts as a greater security against outside chill.

HEAT OF FEVER.—The heat of fever is caused by the destruction of the tissues of the body, beyond their normal limit, and by the retention in the system of the heat that is produced. There is probably less heat produced in fever than when we are at work, but in the latter case it is used up. In fever, the heat accumulates in the body, so to speak; there is a stoppage of the process of using it up. Heat in the body is used up in two ways; first, in the visible work we do, and secondly, in the invisible work in the building up of our tissues. In a fever, the production of heat goes on, but as it is not consumed it accumulates. In treating fever, experience teaches that the application of water to draw off the heat is most beneficial. The principal point is to learn how to apply it so as not to weary the patient.—*Herald of Health.*

WHITE TEETH.—There are no such things as white teeth, as can be proved by contrasting those called white with snow, raw cotton or marble. Roughly, teeth can be divided, as regards color, into blue, gray and yellow, with hundreds of different shades. The apparent whiteness is due to the complexion and hue of the lips; and the "glistening ivories" of the negro are, as a rule, so exceedingly yellow that they would disfigure a white person. It is the black skin, hair and eyes that make them look white.

DYING FROM EXHAUSTION.—A leading physician says that a patient who is lying dying of exhaustion is generally dying of starvation. We give him beef tea, calf's foot jelly, seltzer and milk—that is, a small quantity of the sugar of milk and some fat; but the jelly is the poorest sort of food, and the beef tea is a mere stimulant. The popular belief that beef tea contains "the very strength of the meat" is a terrible error; it has no food value.

SCARLET FEVER.—A girl from Bath, Me., had scarlet fever while at boarding-school. She recovered and went home, and a trunk containing clothing worn while she was ill was put away in the garret. Six months afterward two little children playing in the garret opened the trunk and took out some of the clothing. In a week both were taken very sick with scarlet fever, and one died. No other persons in the neighborhood were ill.

BROODING.—The worst thing you can do is to brood over your troubles. If you cannot stop it in any other way, compel yourself to stop by a heroic exercise of the will.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Adador.

**MIDDLE BAR TUNNEL.**—*Ledger*, Aug. 21: For some time past the work in hand at the big tunnel at Middle Bar has been the sinking of a winze from the tunnel level. This winze has reached a depth of over 40 feet, and we understand good ore has been met with all the way. It is not merely a stringer of quartz, rarely exceeding six inches in thickness, as has been the case with most of the rich deposits met with in this district. The ledge now being operated in the tunnel level is over four feet wide. Indeed, the prospect of a permanent paying mine being developed at this point is more flattering than ever. The depth now reached is about the water level of the river, and the theory entertained by many that the broken character of the gold-bearing formation as met with near the surface, would, below the water line, give place to a solid and well-defined ledge, seems in a fair way of realization.

**MOORE.**—From all accounts the prospects of this mine turning out a good paying property are very encouraging. The ledge encountered on the lower level continues to open out well, both in size and quality. It is doubtful whether the present mill will be started again. It is considered altogether too small. Senator Jones is expected out soon, when the proposition of building a 40-stamp mill will be acted upon.

**SOUTH SPRING HILL.**—The era of dividends has dawned upon this splendid property, and likely to stay for a long time. A dividend of 25 cents per share was declared a few days ago, aggregating \$30,000.

## El Dorado.

**MINES BONDED.**—*Republican*, Aug. 19: D. Coffin, superintendent of the Rogers gravel mine at Smith's Flat, and some San Francisco parties have bonded the Jeffries-Secomb and the Goyan-Combellac gravel mines. These mines lie south of the Linden and Cedar Springs mines, and the new company propose to give them a thorough prospecting during the time they have them bonded. There is plenty of ground in the two mines for a big bank of gravel, and it is to be hoped they will find the same channel that was in the Cedar mine.

## Los Angeles.

**SAN GABRIEL.**—*Times*, Aug. 19: Among the most noted mines now being operated in this district may be mentioned the Martha-Swansea consolidated mines, comprising a group of some 12 mines or six ledges of two locations each, and is the joint property of Messrs. E. K. Alexander and W. D. Root, of this city. These ledges have a trend nearly due north and south, crossing, in running north, the summit of the Sierra Madre range along the western slope of Old Baldy. Over 1000 feet of shafts, tunnels and other workings have been made during the past three years on the first of these series of ledges, to prospect and to some extent determine the character and value of the property. The company is now driving a working tunnel, to cut the entire series of ledges at right angles, at a depth of from 1000 to 1500 feet, and draining them to that depth, a great desideratum, as the ledge fissures carry an immense volume of water. This water, which will amount to fully 100 inches, is worth, for irrigating purposes, when piped to the valley three miles below, \$1000 per inch. The ledges are in the shape of an inverted letter V, widening with depth at the rate of one foot in seven. Their width at the outcroppings varies from three to six feet, and in their course cut the stratification of the country rock at nearly right angles, and which is the best evidence that can be adduced of their being true fissure veins. The country rock is granite, but in its approach to the ore bodies and when forming the foot-wall, it changes to metamorphic or transition rock. For the hanging wall we have porphyry of a deep red color 40 feet thick. Assays of the ore at various depths range from \$10 to \$160 per ton in silver, with a large percentage of nickel. A company stands ready to put up reduction works of 20-stamp capacity for one-half of the entire property, on a showing of \$1000 between wall and wall, and which is to be determined by this tunnel, which is now near completion. The Wilson Electro Reduction Works, with dynamo, will be used, and it is claimed that \$3 silver ore can be worked to a profit. The San Gabriel Valley Railroad will pass within five miles of these mines, at a distance of 20 miles from this city. Near by, and just across the canyon, is the Kelsea mine, famous for the large amounts of native silver taken from it in years past. This mine is owned by a New York company, represented by Mr. A. S. Robbins, of this city, who is also a large owner. The company are now preparing to resume operations, after a year's suspension. The old and well-known Winston mine is also in the immediate vicinity, and has a force of men at work under the direction of Mr. Peter Taylor, of old-time mining fame. The mine takes its name from the late Dr. Winston, formerly Health Officer of this city. His heirs still retain his interest. Mr. I. W. Hellman, President of the Farmers' and Merchants' Bank, is also a large owner.

## Mariposa.

**MINING ENTERPRISE.**—*Gazette*, Aug. 21: Captain Diltz, who has been engaged the past month in surveying a route for a water ditch to his mining claim on Sherlocks, came into town on Thursday evening. That water sufficient for all mining and milling purposes upon his mine for at least seven to nine months of the year is one of the inevitable blessings he, by his indomitable will and energy, is bound to have. The survey is completed and has terminated most satisfactorily to all who have an interest in that section of country which abounds with rich mines. That the route is feasible and water can be obtained is no longer a question. This new survey is a continuation of the old Snow creek ditch, commencing at its terminus near Malone's, or the old mill-site of Clark's saw mill; running northerly down Bear creek and passes westerly around the mountain in the neighborhood of Colorado, and headwaters of Saxton's creek, and the Lacy mine; thence to Long Gulch, where a tunnel of

14 rods between Long and Mill Gulch will be found necessary to run. This will save a distance of 186 rods around, and a gain of six feet in height leading to the mine. From this point to the Diltz mine is about two miles, making the actual distance of the new survey eight miles, 290 rods. The terminus of this canal will be 100 feet above the highest point on the mine, giving a fall of 700 or 800 feet on the north side, and 400 or 500 feet on the south, thus affording this great mine an advantage of power by water force, when the contemplated work is completed, greater than is had or enjoyed by any mine known to this section. The old Snow Creek ditch, which is about eight miles long, was built and is owned by J. H. Malone, which, added to the proposed continuation, will make it 17 miles in length. It is expected by the owners of the respective properties to consolidate the interest of each into one enterprise, with a view of disposing of the same to a company of capitalists, with whom negotiations are at present going on, or being considered. Capt. Diltz and J. H. Malone are the two oldest and best experienced miners we have in the country, and should they be able to carry out their views in regard to the latest work in which they are engaged, they will be considered the greatest of benefactors to a valuable mining interest in this county.

## Nevada.

**NOTES.**—*Grass Valley Tidings*, Aug. 19: The Boston mine, on Wolf creek, is now looking better than ever, and is showing well and producing fine milling rock both from the 180 and 320 foot levels. On the 180 level the workings are to the south of the shaft, while on the 320 level quartz is being stoped on both sides of the shaft. Some of the rock taken out will mill \$100 per load, while the average per load from the whole mine will go \$60 per load. The quartz shows well in free gold and carries plenty of good sulphurets. The Peabody mine, situated between Gold and Church hill, has been prospected more or less for several years, and is now being worked under lease by Charles Mill & Company. Their work has been mainly done on the 180-foot level, from which they have run a drift northerly 230 feet, giving backs of from 60 to 70 feet. The ledge all along this drift shows in size from eight inches to two feet, all good milling, yielding from \$18 to \$20 per load. The mine is worked cheaply, the hoisting and pumping being done by water-power, the water being obtained from the South Yuba Canal Company. The prospects of the Peabody are better now than they have ever been before, and that the property will be reliable and lasting there is good promise.

**MORNING STAR.**—*Grass Valley Union*, Aug. 16: On Monday Capt. Frank Richards went over to Iowa Hill to visit the Morning Star drift mine, in which he and other Grass Valleyans are interested. This mine has been heretofore mentioned in the *Union* as having obtained rich prospects by making a raise from the tunnel into the gravel channel and then drifting along the channel for a distance of over 400 feet. The last gravel taken out yielded \$13 to the carload, and one man could take out two loads of gravel per day. At one point where the up-raise was the tunnel was in 1900 feet, and it was found necessary to continue this tunnel 500 feet to bring it under the channel where the rich pay was found, in order to secure practical and economical working. To this end a contract was let to John Hobson, of Iowa Hill, to run 500 feet of tunnel, and he has had a force of men upon it for some months. The rock is found exceedingly hard, as many as 50 drills being used in putting down a single hole. Of late the ground has been a little more favorable, but yet only about six feet of drift is made in a week. There has been 160 feet of drift run under the contract, and it is hoped to complete the full 500 feet by the first of the new year. The work is tedious and expensive, but the rich prospects obtained are full of encouragement, as when the channel is opened up a large output of gold will certainly be realized.

**THE PITTSBURG.**—*Transcript*: Superintendent Samuel Granger is crowding work at the Pittsburgh quartz mine on Gold Flat. The Pittsburgh has produced many thousands of dollars in years gone by, and was still yielding liberally, when in January, 1881, the water came in so fast at the 800 level that the machinery could not keep it under control. The stockholders, instead of putting in heavier pumps, became disheartened and quit. Recently it was determined by them to resume in the face of all difficulties. By last Saturday night the water was lowered to the 800 level, a six-inch plunger pump accomplishing the labor. A four-inch pump is to be put in from that level down to the 900, or the present sump, and with that once in operation the bottom will soon be clear of water. As soon as this is all done (which will be during the present week) drifting will begin on both lower levels. A tank holding 44,000 gallons of water, and fed by the South Yuba ditch, has been erected on the hill at a point where it gives 190 feet of fall. A Pelton wheel has been put in and was started Sunday. All of the pumping and most of the hoisting will be done by water-power hereafter, greatly reducing expenses. The steam-power will be used only occasionally for hoisting purposes.

## Siskiyou.

**SAWYER'S BAR.**—H. Stanislawsky in *Yreka Union*, Aug. 19: Inasmuch as quartz mining is engrossing more attention on the Pacific Slope of late than for years past, allow me, through the mediumship of your press, to impart to your readers a few facts concerning the New Eldorado, recently discovered on Knownothing creek in Siskiyou county. The above-named creek is one of the affluents to the South Fork of the Salmon river. About three miles above the forks and four miles below Fyfield's store we travel up Knownothing creek five miles, which brings us to Laflon & Co.'s mines. We entered one of their valuable properties on which they have a drift 150 feet, tapping their perpendicular shaft at the 50-foot level. The ledge at this depth is 2½ feet in width, standing perpendicular and encased in slate and porphyry, with three-inch gorge on slate side. The rock works from \$60 to \$80 per ton. One mile further up said stream brings us to Radelfinger and Funk's mines. They have four mines, the Gold Run, Jennette, Big Blue and Gilt, all fine properties incased in slate, porphyry and granite, and standing at angles from 60 to 80 degrees. Gold Run is 3½ feet in width, showing free gold across the entire ledge, with numerous spurs dipping toward the main ledge and varying from 4 to 12 inches in thickness. From this ledge

Messrs. Radelfinger & Co. worked 2300 pounds of ore in an imperfect little tub, put up only to test the ore preparatory to putting up a good arastra, which realized them \$264.50. The Jennette is their favorite. Said ledge is seven feet in width at 40-foot level, incased in granite and slate with fine gouges on either side. If this is not a true fissure vein, none ever existed on this earth. Granite being the mother rock of the earth and slate its companionable sister. A ledge found in such a contact—if mineral-bearing at the surface—will continue so to the bowels of the earth. The formation in which a ledge may be found is of more importance to the miner than the ledge itself. How many have wasted fortunes in the hopes of "striking it" at a certain depth, when the formation has been inconsistent with the indication. The casing of a ledge, regarding the continuity and texture of the same, is as important to that ledge as the soil is to the plants that grow on its surface. The Gilt is two feet in width and will work \$80 per ton, with a contact of slate and porphyry. The Big Blue is from 40 to 60 feet in width and will work from \$6 to \$10 per ton. Taking the cluster of mines as a whole, found on Knownothing creek, we predict at no distant day they will be rated among the most valuable plants on this coast. The ore is auriferous, fine-grained and lively, free from sulphurets and pyrites and other refractory metals, and all that is needed for speedy development is capital to roll the stone from the sepulcher of hidden millions. However, the gentlemen who own these properties are working them with arastras, and anticipate erecting mills next spring.

## Shasta.

**MINING ITEMS.**—*Shasta Co. Democrat*, Aug. 18: Conant's five stamps on the Uncle Sam are pounding out the "yaller truck." Yesterday, Jack Conant brought to town the first chunk of bullion milled from the Uncle Sam. Several very promising gold quartz locations have been recently made on Oak Run, east of Millville, the croppings of which prospect handsomely. The Black Bear mine on Squaw Creek, one of the claims Conant sold to Reiley & Matthews, is developing hugely. Several mining men who have seen this property lately think it one of the biggest and best mines in the State. The vein is said to be 12 feet wide and the ore will mill an average between \$20 and \$25 a ton. Almarin B. Paul, a mining man, representing San Francisco capital, is in the county inspecting mining property in the various camps. This is his second visit here. Mr. Paul has been engaged in mining enterprises in California for over 30 years past, and gives it as his opinion that Shasta is destined to develop into one of the richest quartz-mining counties in the State. He further says that Squaw Creek presents the richest undeveloped surface prospects he has ever seen in any district on the coast.

**CENTRAL CO.**—*Anderson Enterprise*, Aug. 14: While in Shasta the other day, we were credibly informed that the above-named mining company had just caused a new boiler to be put up instead of the small one heretofore used by them. The ledge is said to be from 6 to 12 feet in width, and the rock is good milling ore. The mill now has a capacity of about 16 tons per day and night. The mill will be in operation next Monday. This immense ore deposit is in Old Diggings, and is owned by Bell, Hopping et al. The rock yields about 1½ per cent sulphurets, which go from \$250 to \$300 per ton. The present owners of the Central have expended a great deal of hard coin in getting their mill and mine in a shape to make money out of it, and they certainly richly deserve what, in our opinion, they will be sure to have—success.

## Tehama.

**MILL RUNNING.**—*Cor. People's Cause*, Aug. 21: Work in our mines is progressing slowly. The mill recently completed on the Eureka mill-site is running pretty regular. It is the general opinion that the mill will do good work, provided a competent person is placed in charge. The objection advanced by parties who have had considerable experience in milling quartz is that the screens used are too coarse—being No. 5 slot screen—and that there are too few plates. Mr. Williamson, who placed the machinery in position, undoubtedly understands his business. The Pound Cake company had 20 tons crushed at this mill two weeks since, the result being almost satisfactory. After a run of about 60 tons from the Mammoth a cleanup was made showing about \$10 to the ton. This encourages the owners in the belief that they have a rich mine. The Bully Chooop company are taking out considerable rich ore, about 50 tons of which they intend to have crushed in the Eureka mill. This company has taken out 20 or 30 thousand dollars in former years.

## NEVADA.

## Washoe District.

**BEST AND BELCHER.**—*Enterprise*, Aug. 21: The crosscut west on the 600 level has made but 14 feet advancement on account of considerable other work being found necessary easing timbers, owing to the swelling of the ground; total length of crosscut, 144 feet. Material, vein porphyry with seams of clay and quartz. The construction of the heavy damming bulkhead on the 2500 level, north of the Osbiston shaft, is progressing as fast as the ponderous nature of the work will allow. The east crosscut was advanced 34 feet, making a total length of 82 feet. Material, hard blasting porphyry.

**CHOLLAR.**—On the 3200 level the main south lateral drift has been extended 40 feet, making a distance of 150 feet from the center of the Combination shaft station. In the shaft during the last week or two the valves of the big hydraulic pump have had to be overhauled and repaired. This was because of the wear and tear produced by the dirty, gritty water caused by the recent heavy cloudburst on Mount Davidson.

**KENTUCK.**—Daily yield 40 tons from above the 800 level. The Pelton water-wheel on the 700 level continues doing excellent work, hoisting from the level below. When the Crown Point mine resumes operations on the 1st of next month, the winze connection between the 1400 and 1300 levels can be completed in a very short time, furnishing a good air circulation as well as means for getting at the large amount of low-grade ore at that point.

**HALE AND NORCROSS.**—On the 3200 level the two crosscuts west, north and south of the deep winze station are being pushed ahead, and both

show very good streaks of ore. In fact, a very promising ore vein is being developed to the westward of the main lateral drift. This main drift is being continued north toward the Savage, with its face in good working ground, showing streaks and bunches of good ore.

**SAVAGE.**—The face of the main south lateral drift on the 600 level, as also the crosscuts west from it, show a large amount of good pay ore, but hoisting to the surface has been suspended on account of the ore bins being full.

**MONTE CRISTO.**—The repairs to the hoisting machinery will be completed so as to resume work in the shaft Monday, running the drift west on the 150 level to intersect the main ore vein.

**CON. CALIFORNIA AND VIRGINIA.**—During the last two weeks the ore shipped to mill has averaged over \$20 per ton, with some streaks which ran considerably higher. The ore is evidently better at the north end, but less in quantity. Exploration and development work progresses well on the 1400, 1500 and 1650 levels as usual.

**MEXICAN AND UNION.**—On the 700 level the north drift in Union is making good progress in favorable working ground, and is now in 184 feet. Crosscut No. 2 in Mexican is in 144 feet. A drain is being cut in the floor of the main north lateral drift of these two mines to carry off the seepage of water.

**GOULD AND CURRY.**—On the 450 level or working station, 150 feet above the 600 level, the lateral drift north was extended but little, owing to having considerable casing and repairing of timbers to be done. The drift northeast from the head of the incline was extended 20 feet.

**CROWN POINT AND BELCHER.**—The repairs and resetting of the incline engine are being pushed to completion as speedily as possible, and it is now definitely stated that this work will be completed ready for the resumption of work in the mines on the first of next month.

**POTOSI.**—Diamond drill hole No. 7, a short distance south of the Chollar south line, has been run to the distance of 225 feet eastward, and shows a splendid large vein of pure white quartz, carrying mineral giving very low assays.

**SIERRA NEVADA.**—On the 520 level the north lateral drift No. 2 has been extended 52 feet, making a total of 530 feet. Material, vein porphyry, clay and quartz seams.

**OPHIR.**—On the 1465 and 1300 levels the exploration drifts to the southwest and south are making good progress in favorable working ground.

**ALTA.**—The main lateral drift south from the west drift is following the Keystone vein. Cross-cutting the vein will be indulged in next week.

**YELLOW JACKET.**—Daily yield, 100 tons, which is all the Brunswick mill can run at present, owing to the low stage of water in the Carson river.

## Esmeralda District.

**ASSAYS.**—*Walker Lake Bulletin*, Aug. 19: The Esmeralda Con. Co., in addition to work upon its other mines, has commenced operations on the Durand. In the new winze being sunk from the lower workings, some very rich ore has been struck. Indications in the mine are very encouraging. The company's pay day was on the 10th, when all claims were promptly paid. Mr. Ann, resident director, left for San Francisco on Monday and expects to return in about a week. It is rumored that Wagner, of the Miner's mill, has purchased an interest in the "85," and that arrangements are being perfected to secure and start up the Silver Hill mill. Work on the Antelope and other mines is progressing favorably.

## Eureka District.

**ADAMS HILL.**—*Eureka Sentinel*, Aug. 17: A *Sentinel* reporter visited Adams Hill yesterday morning and found from 40 to 50 miners delving away in a number of the properties. The principal work being done at the Bowman is the sinking of a new two-compartment shaft, each four by four feet in the clear. It appears that work was prosecuted in the old shaft to a depth of 332 feet, when it was found that the ore first discovered in the upper levels all pitched to the northeast. On the 300 level it was not encountered until a drift 450 feet was run. The work of extraction under these circumstances was deemed impracticable, and Supt. McAulay finally decided on a new shaft 900 feet northeast of the old one, which has been sunk to a depth of 93 feet. When it gets down a distance of about 600 feet the old ore body will, no doubt, be again encountered. Immediately below the surface a body of low-grade ore was passed through that has every indication of being at least 100 feet long and 30 feet wide. The company's property consists of five original claims—the Bowman, Europa Con. (three properties combined) and the Rasine, all of which are patented. The Oriental & Belmont mine, undoubtedly a good property, adjoins the Bowman on the northeast; but no work is being done in it at present. On the north lies the War Eagle, owned by James Slain, who every now and then makes a shipment of ore. The Wide West mine is being worked by Joe Molino, Alec Frazier and a couple of others. Occasional ore shipments are made. Three tributaries find employment in the Lone Pine. Messrs. Whittenberg, Spencer and Swick are working in the Macon City with fairly good results. The Marguerita mine, owned by "Jim" Haynes, shipped last week 22 tons of good ore, and there are upward of 40 tons on the dump ready for shipment. Active work is being prosecuted in several parts of the mine. Five men are employed. No work is being done in the King Lear. The new double-compartment shaft in the Paul Pry mine was sunk some time ago to a depth of a little over 100 feet, when several prospect drifts were run. The Silver Lick embraces five original claims, four of which are patented. Twenty tributaries are at work in the property, all of whom are taking out ore. As a rule the ore is very good. In value it runs about half in gold and half silver, and the shipments made furnace from \$40 to \$500 a ton. The mine never looked better. Supt. Davis is prosecuting work vigorously.

## ALASKA.

**SOMETHING ABOUT THE COUNTRY.**—*Eureka Sentinel*, Aug. 15: John Strandberg, an old-time miner of Eureka district, returned yesterday to the Base range from Alaska, where he went during the early part of last spring and remained a couple or three months. He has great faith in the mineral

resources of the country and says it is his belief that Douglass and a neighboring island (the name of which latter we are now unable to recall) can alone furnish within the next 20 years enough gold to supply the wants of the nations of the world. What is needed on these islands are mills similar to the Treadwell to work the ore, which is abundant but of low grade. Men of limited means there have little show. What is also required is capital, and until more large mills are constructed it is a good section for the impecunious to stay away from. The miners working for the Treadwell Company are chiefly Indians and Chinamen, the former being strong, and hard workers are the preferred class. The mill hands are principally white men. Mr. Strandberg says prospectors who go to Alaska generally land at Juneau City and there outfit for Stewart river, a section that is known to be rich in placers. The river is a tributary of the Yukon and is distant from Juneau about 1000 miles. The trip consumes about a month, and is difficult to make, especially with an outfit. It is believed that by next spring a line of small steamers will be run to within 30 miles of the place, when a great rush will no doubt be inaugurated. The last party of miners who returned to Juneau from the placers produced coarse gold in good quantities, and said they would willingly have paid \$100 per sack for flour at their claims, but their supply of provisions becoming exhausted they had to suspend work and return for more. In the winter time, and until June, the weather in that section is extremely cold, but during July and August the snow disappears except in gulches, where it drifts very deep. It is a mistake, Mr. Strandberg says, for prospectors going to Alaska to outfit in San Francisco, except in the way of clothing, blankets, and a few special articles required in mining. Provisions and certain other supplies can be purchased very reasonably in Juneau. Flour, for instance, is sold at that town for \$2.50 and \$3 per hundred weight. Freight from San Francisco there is but \$8 a ton. The fare is \$40 steerage and \$60 cabin.

## ARIZONA.

**GOLD MINE.**—Prescott *Courier*, Aug. 19: Mr. A. E. Foote, late clerk of the Supreme Court of the Territory, has purchased one-half interest in the May Flower gold mine, in Castle Creek district. The mine is well developed and contains an abundance of very rich free-gold-bearing ore. It is located but three miles from a stamp mill and adjoins the location of the Colorado Mining Co. An assay made by Prof. Stahl yesterday shows \$42.52 in gold and \$2.84 in silver. Workmen have recently been taking out rich ore which is stored on the dump. We regard the May Flower as very valuable property. It was located January 1, 1882, by Charles Thompson, who has occupied it and worked it since.

## COLORADO.

**ABOUT IDAHO SPRINGS.**—Denver *Tribune-Publican*, Aug. 19: It is reported that a good body of mineral has finally been struck in the Rover lode, Fall River. This property belongs to some Denver & Rio Grande Railroad men, and we hope they will realize their fondest hopes in working it. Last Tuesday was pay day at the Freeland and Plutus. Secretary True had his hands full for the day dealing out "filthy lucre" to the boys. From \$15,000 to \$20,000 is paid out monthly by these two mines, which helps to make good times around Idaho Springs. Stop them and you would notice the difference at once. Gilpin county has done something she should have done years ago—organized a tramway company. The capital stock is \$50,000. The track will be a 30-inch gauge, and the cars, to be drawn by locomotive, will hold a cord of ore each. Work will begin at once, and the road pushed to completion. Running from the mills at Black Hawk to all the principal mines on Gunnell Hill, Quartz Hill and Nevada, it cannot help but be of great benefit to that district. Contracts have already been made with the success of the enterprise at the start. We had the pleasure of meeting Henry Balsinger, part owner of the Hubert mine, Central. The Hubert is one of the boss mines, and is turning out some \$20,000 to \$30,000 monthly. Col. Bush and Mr. Burke, of Denver, own a half interest in this property, while Balsinger and his father own the other half. Henry showed us a specimen about the size of your two hands, covered with crystallized gold—a recent strike in the mine. Through the courtesy of Mr. Ben D. Allen, manager for Mathews & Webb's Sampling Works, we are enabled to give the following reliable figures, taken from the books, for the seven months commencing January 1st and ending August 1st: These works purchased ore which contained the following values: 133,217 ounces of silver, 10,394 ounces of gold, 289,416 pounds of lead and 29,654 pounds of copper. The value of these purchases foots up the handsome sum of \$358,532. At this rate the output of this end of the county will be largely in excess of last year, providing silver doesn't continue going down for the next five months. For the month of July alone there was purchased ore to the value of 28,361 ounces in silver, 1886.87 ounces in gold, 65,870 pounds of lead and 1050 pounds of copper. Of course the low price of silver will cause a shrinkage in the output all over the State. There is considerable ore shipped by the miners and some other samplers direct to Denver, but being unable to obtain reliable information of these shipments we do not publish them.

**ABOUT THE MINES.**—La Plata *Miner*, Aug. 14: Ore shipped for the week ending August 13th, 360 tons. Mr. Theo. Grabowsky has completed 100 feet of drifting on the Paul. G. B. Inge is working a full force on his Ice Lake Basin properties. The Iowa has opened up a large body of ore already, and the prospects are very bright. There is a big deal on foot in Red Mountain properties, but the particulars are being kept awfully close. Tom Trippe has the lease on the Round Mountain lode, and began work this week with a large force of miners. The breast of the Grand Prize tunnel is in a hard, flinty quartz, worth \$50 a foot, and progress is consequently very slow. Two shifts are hoisting the water from the Copper King, and ore will again be coming down from that property in a few days. With the exception of the Royal Tiger, every mine in Arastra basin is being worked by lessees, which speaks well for that district. The Belcher keeps up its lick by sending five tons of good ore down every day. The Belcher is one of the reliable mines of the camp. Sheridan ore, at the rate of 75 tons per

day, is coming over the range. This amount will be increased five tons within the next 15 days. The sale of the famous Bill Young mine, at Mineral Point, was made this week to Denver parties. A big body of high-grade ore has been opened in the new drift. The Mountain Queen resumed work again yesterday morning. A shaft is to be started at the lowest point on the ground and continued down indefinitely. The following Red Mountain properties are putting in machinery or have their plants on the road: Jay Eye See, Candice, Paymaster, Cora Bell, Little Annie and Robinson. The Brooklyn has been bonded to Jos. Wilkinson. A 700-foot tunnel was started yesterday morning, which will cut a point under the shaft at a depth of 400 feet. Shaft is down 100 feet. The ore from the Queen of Cement ran exceedingly well for the first shipment, and will pay handsomely for working. Dave Williams has returned to the mine to begin sacking, while George Bradford will attend to the business at this end of the string. Manager Kisingbury, of the Hawkeye, reports that good progress is being made at the mine. The trail is about completed, and a shaft started on the ore body. Already a considerable pile of ore is on the dump and a shipment will be made soon. Theo. Ressoche is making things lively around the Manchester Boy. The shaft is down 60 feet, and already indications of ore are seen. Specks and bunches of galena are making their appearance among the yellow iron, and it is thought that ore will be encountered by the time 80 feet is reached. Two shifts are being worked, and machinery will be put in should water be encountered. The Howardsville concentrator, at Howardsville, is making a very successful run on Green Mountain ore. The concentrates are remarkably clean and the slimes free from mineral. The *Miner* is glad to note that at least one concentrator in the country is a success, and the only reason the several others are not is in the fact that they are, and always have been, badly managed. Manager Garland is the right man in the right place. The Silver Lake mine, in Arastra Gulch basin, to obtain the lease on which there has been considerable contention on the part of our miners for several months, has at last been secured by J. H. Robin and B. W. Thayer. The mine has an immense body of ore in sight, and will, in a short time, become one of the most important producers of the country. Work will be started up on Monday morning with a force of seven men for the present. The crosscut being run by the Mathews Bros. to strike the Plutus is being pushed rapidly to completion. The total length of the tunnel is in the neighborhood of 300 feet, and the vein will be cut at a depth of 250 feet. The Plutus is the extension of the Uncle Sam, and is being developed from the Cascade basin slope. The surface croppings show a fine streak of galena ore and some very high-grade gray copper. Messrs. Mathews, the owners of the property, have been working a considerable force of miners since the opening of spring, and they think not more than six or eight feet further will have to be run to tap the lode. Should the vein improve from the surface down in proportion to the depth gained, the mine will be one of the best properties in this section.

## IDAHO.

**EAST FORK.**—Cor. Ketchum *Bulletin*, Aug. 18: The Philadelphia Company are shipping lumber to flume their ditch, running to the concentrator, and are expecting to put hoisting works in the North Star mine. Should they do so, work will continue all winter with a pretty large crew of men. Wm. McQueen, from Salt Lake City, has taken hold of the Legal Tender mine, on North Fork, discovered this summer by Bruce Reed, and is working a crew of five men in going down to see if this is not a rich mine. Ed. Le Fort owns the claim adjoining, and hopes they will strike it rich. The Pride of Idaho is looking better than ever, and is taking out high-grade ore. James W. Davison deserves to make money, as he is one of the most energetic and enterprising men we have here on East Fork. S. S. Piffin & Son are working their mine, the Leader, on the other side of the creek, and are just shipping 100 sacks of high-grade ore. Dave Thuhner is still working hard on his lease on the Independence and expects in a few weeks to be happy, as he is quite sure to strike a rich body of ore. The Courier mine is running a new tunnel, under the management of James Judge, Jr., and there is no doubt but that they will soon strike something that will gladden the hearts of the company, as Mr. Judge is an old, experienced miner.

## MONTANA.

**THE WEEK.**—Butte *Inter-Mountain*, Aug. 21: As predicted last week, a noticeably better feeling prevails in business and mining circles, though several companies are still running with the margins on the wrong side of the ledger. In proportion to the amount of ore treated, the producers of custom ore are perhaps working with better results than any other class of miners. As an evidence of this it may be stated that for the month of July the Butte Sampling Works received and shipped an even \$100,000 worth of ore, the great bulk of which was produced from comparatively undeveloped mines. The big mills and smelters are going ahead with their accustomed activity. At Anaconda we hear of new appliances, new methods of treatment, increased capacity and reduced cost of production. The Orford smelter is also increasing its plant so that it can calcine more ore. The Clark smelter is running to perfection and using up a great deal of high-grade silver ore to enrich the copper matte. The Parrot and Colorado Works are not making much noise; but they are making plenty of copper, and that is better. The Montana smelter is closed; but it is closed for some reason other than the lack of ore or ability to make copper at a profit. As for the mills, they are making a grand struggle for existence. Some are making money, some are holding their own, and some are losing a little. The main hope of the companies now is to keep expenses down and find a higher grade of ore than they have heretofore been treating. Prospecting in the lower levels is therefore active. In the Alice, at a depth of 800 feet, there is a regular streak of good ore, and it is being vigorously explored, in the hope that it will lead to a large body of the same kind. If silver would only rise to a dollar, the Alice people could realize plenty of money, for such an advance would make a difference of nearly \$10,000 per month in

their earnings, or enough to pay the usual quarterly dividend. In the Lexington the 1000-foot station has been reached and explorations are being pushed. The crosscut has been driven to the ledge, and drifting will show before long whether the company can continue to make silver at 90 cents or not. At present the mill is working up considerable custom ore, and it is reported to be doing well. The Moulton mine is reported in good shape, and the mill keeps ahead of expenses, though its profits have been greatly curtailed by the silver decline. The Silver Bow mill is doing well on the product of the Belle of Butte, and the Dexter is dropping its stamps on ore from the Butte Original. During the week silver has held its own, and copper has advanced about \$15 per ton for Chili bars—a most encouraging advance, and one which there is every reason to believe will continue. The curtailment of production can have no other result. On the whole, the outlook is much more satisfactory than it was three weeks ago.

**A NEW FIELD.**—Cor. Butte *Miner*, Aug. 14: At a point some 25 miles northwesterly from Thompson Falls there empties into Clark's fork of the Columbia river a noisy, broad sheet of water, fed from the snows of the Kootenai mountains, called, without regard to its physical aspects or local characteristics of its valley, Vermilion creek. Some two miles above its confluence with Clark's fork a belt of auriferous veins has been exposed on the flanks of the mountains by partial erosions of the magnesium slates from the underlying granite. The granite rocks thus exposed show numerous veins of gold-bearing quartz, carrying largely of the metallic sulphides, oxides and carbonates of iron, inclusive of brown and black hematites. The gold is disseminated in the quartz in variable amounts from a few colors to as high as \$105 to the ton; that is to say, the comparative allotment of gold to each vein has some analogy to the diverse and unequal distribution of ready cash among humanity in general, some being affluent, many comfortably "heeled," and a still greater number being paupers. The veins, of course, are not all rich, but quite a number would be largely productive if judiciously handled, a fair percentage would yield profitable returns, and the majority, as everywhere else, would be too poor to work. The field, however, for exploration for valuable mines extends over a large area of mountainous territory, and affords to the prospector quite exceptional opportunities for acquiring valuable property. It also offers to capital the inducement of safe and cheap investment in the prospects already opened. The local features of the camp are particularly interesting to the mining geologist. Another item that may interest some of your old placer miners is the fact that portions of the creek-bed were worked in an early day for gold, not, however, on bedrock, and the probabilities are that if the ground was worked on modern methods it would return no insignificant profit. This opinion is inferred from the fact that money was taken out when the costs and difficulties were greater than now, and for the additional reason that fair prospects can now be had either in the bed or in the banks of the creek for several miles above its mouth. The venture would only be successful to parties having the means to construct a bedrock flume and work the ground on a large scale. Every cubic foot contains more or less gold, and the question of profit resolves itself into one of handling a maximum of ground at a minimum outlay.

## NEW MEXICO.

**WHAT IS DOING.**—Silver City *Enterprise*, Aug. 20: M. H. Twomey has been here this week waiting for pumping machinery to arrive. He has a contract to sink the shaft 300 feet more on the St. Louis mine in the Burros, and run drifts for prospecting at various levels. The shaft is already down 300 feet, and the water is 190 feet deep. The Gray Hawk group, in Silver Creek district, adjacent to Cooney in the Mogollons, is producing large quantities of fine ore. The output is packed across to the locality of the Peacock mine, where it is stored and will be kept until such time as an opportunity can be gained to make a thorough test of it at the mill named. This, it is hoped, will be before long. The mine at Gold Gulch, in which E. L. Guldin bought an interest lately and which he is working upon a lease, is reported as looking finely. The ore streak is developing, and now shows in width sufficient to justify expectation of a continuous output when stoping shall be commenced. Some ore recently tested, and which previously was thought to be too low grade to handle, returned by assay sample from 58 to 112 ounces silver per ton. Mr. Guldin contemplates making a shipment soon. The operators of the Deep Down mine at Pinos Altos, Messrs. Lewis & Co., are finding more of the very rich free-gold ore which occurs so frequently in pockets throughout the black iron, manganese and galena that fills their vein. Some of the specimens are unusually rich, even for the Deep Down mine. Much of the same sort of material is found in the deep workings of the Atlantic mine, now operated by Peter Wagner. It is found as usual in pockets scattered through the average stuff of the mine. John M. Wright and R. S. Talbot are in St. Louis on business connected with the Peerless mine. The outcome of their visit is expected to be the resumption of work upon the Peerless under a new order of affairs, as the difficulties which stood in the way are reported to have been amicably arranged. It is understood that the company has two well-known mining men in contemplation for the position of manager, one, Platt McDonald, formerly of Black Hawk, being favored by the local owners, and the other, Mr. Comstock, formerly superintendent of the Hornet mine at Eureka, being favored by the St. Louis shareholders. In either choice the company will do well and the mine be worked to the best advantage. The Mogollons continue to be the center of attraction from the point of new discoveries and newly opened mines. In St. Louis, where there are large Mogollon interests held, there is more or less excitement all the time concerning the developments made in what are known as the St. Louis properties, and which are headed by the Sheridan and Laclede mines. Rich and extensive ore bodies are reported from both within the past week or two, and the stock of the companies is held firm at good prices. Should continued development of these mines prove as satisfactory as what has already been accomplished, there is abundant reason to hope for New Mexico's biggest boom to be located in the Mogollons.

## OREGON.

**WORK DOING.**—Jacksonville *Times*, Aug. 20: Placer miners in Josephine county have finished for this season. Jacob Miller, of Portland, is inspecting the mines of Josephine county. The Griffin ledge in Slate creek precinct, Josephine county, is prospecting well. Quartz is now being taken out of the New Eldorado mine, owned by McKenzie, Chale & Co. Ray & O'Donnell are still taking quartz out of their mine on Gold Hill, which pays well. Walter Simmons has finished cleaning up at his placer mines on Galice creek and did well. Wimer & Son, of Waldo, have finished cleaning up and shipped a large quantity of gold-dust. Work is progressing day and night at the Hope ledge on Wagner creek, where the Medford mill is being operated. J. E. Harvey informs us that Frank Mee and Thos. Carr have struck good prospects in their quartz mine on Foot's creek. The wingdam Dan Fisher, Robt. Hardman and Wm. Stuart are building in Rogue river, near Fort Lane, is about finished. The Eastlick Brothers cleaned up 153 1/4 ounces of dust from their mine at Oro Fino, Siskiyou county, Cal., a few days ago, or about \$25,000. Martin Laist and Chris. Kretzer picked up a nice nugget of gold and silver, with which was mixed some quartz, a few days ago. It was worth \$100. Baume, Klippel & Co.'s engine and other machinery for their quartz mill on Shively gulch arrived from Portland this week and will soon be in operation. Wm. Naucke, Beach & Platter, N. DeLamatter and other merchants of Josephine county, have each shipped a considerable amount of gold-dust this season. Albright & Taylor have commenced prospecting a promising ledge in the Jackson creek district, Robt. Elliott, an experienced miner, being in charge of the work. Some very rich quartz has been struck in the Green Bros.' ledge on Galice creek by the parties who have bonded their mine, and who are running tunnels to test it thoroughly. L. D. Brown, of Portland, returned to Gold Hill last Tuesday morning and is looking after his mining interests in that section. It is claimed that his new mill will be in running operation before long. It is said that the 30 tons of quartz from B. A. Knott's ledge in Blackwell district, recently crushed by L. D. Brown's mill, return \$18 to the ton, though this report is not confirmed. However, enough is known to establish the fact that it is a well-defined mine and can be made to pay handsomely. Frank Payne, of the East Portland foundry, has about completed all necessary arrangements for the establishment of reduction works on a small scale in that city. He has just finished a 6-stamp mill for crushing ore and is now engaged in making the other appliances necessary for the enterprise. It is understood active operations will begin within a few weeks. A Gold Hill correspondent states that Elder Whitney, who has extensive mining interests in Jackson county, is at Gold Hill. He is about to experiment on reduction works of his getting up; also that Mr. Brown, who put up a five-stamp mill on the celebrated quartz ledge of John Swinden, has sold one-half interest in the mill to Mr. Haskell, of Walla Walla. They are adding five more stamps to the mill.

## UTAH.

**LITTLE COTTONWOOD.**—Cor. *Tribune*, Aug. 18: The Frederick mine has been running in full blast for some time, and everything is working in a business-like manner in that mine, under the management of Martin K. Harkness. The Flagstaff is running all right again, after being idle for a few days on account of the disarrangement of some part of the compressor. Engineer Osterwald has been working night and day in order to pump the water out of the mine. Foreman John Bryant has been faithfully working for the success of the Flagstaff Mining Company. It is claimed that the Flagstaff mine is a regular outlet of water from the Eclipse mine, on the opposite side of the hill, in the Big Cottonwood district. The Vallejo mine still holds out as an ore-producing mine. Superintendent Robert Howarth, of the Emma Hill Mining and Tunnel Company, has received the long expected engine for the purpose of ventilating the Buffalo tunnel which is now 1200 feet in length. The New Emma, the backbone of Alta City, is running night and day with all possible speed and skill under the management of George Cullins, who has surmounted all the difficulties in the development of that celebrated mine. Mr. Cullins is much pleased with the appearance of the ground in the shaft. You need not be surprised to hear of a big strike in the New Emma at any day. The dump shows that the miners are not far from a big ore body, which will solve the question of deep mining in this district. Foreman John Stillwell and the friends of the company here are equally happy with the bright prospect in the New Emma. F. Haight, with a good force of men, is still working the Old Emma dump with success. For the better working the jiggling apparatus, he has bought a small engine, which has been in operation for some time and gave entire satisfaction. David Hepburn and William Green have still retained the lease on the old underground working of the Old Emma. They have built a flume 700 feet in length. They intended to take the waste from the old underground working of the Old Emma through the Equitable tunnel, where connection was made years since, to the surface at the flume, thence to the jiggling below in front of the New Emma dump, where is a good supply of water. Mr. D. C. Murphy is building a safe and comfortable cabin on the Murphy mining claim for the purpose of working the same. The Centennial, the property of our worthy citizens, James A. Varnes and Judge C. W. Bennett, is looking well. The City Rock still holds plenty of good ore in sight and some ready for shipment. The Evergreen is still classed among our ore-producing mines, under the management of Supt. Groesbeck and his irrepressible foreman, Joseph Smith. There will be another shipment of ore from the Evergreen in a few days. The Prince of Wales mine, the miners' friend, the property of Walker Bros., is still sending her regular quota of ore to the smelters, under the watchful eyes of Supt. and Foreman John Wasley. The Cla mine, the property of a Salt Lake company, and the management of Nelson Sandburg, is looking O. K. A good quantity of ore has been taken from the Clara. I understand that the company is about to start a tunnel 100 feet below the present workings for the purpose of tapping the ledge deeper. There will be room enough to give employment to 20 or 25 miners.

# PUMPS FOR RECLAMATION, IRRIGATION, AND DREDGING.

WILL BE ON EXHIBITION AT MECHANICS' INSTITUTE FAIR.

This Pump has thrown, on a Test, 234,000 Gallons per hour, On a Lift of 10 feet.

STANDARD IRRIGATION AND RECLAMATION PUMP AND ENGINE COMBINED.

PIT, VERTICAL, BULKHEAD, TURBINE, CENTRIFUGAL AND LOW-LIFT PUMPS.

WE MANUFACTURE ALL KINDS OF

Machine Tools, Including Engine Lathes, Drilling Machines, etc.

Horizontal, Single Acting, Compound Condensing, and Automatic Steam Engines.

Cast Iron Sectional Boilers, Horizontal and Vertical Tubular Boilers, Water Valves, Water and Steam Fittings, Hydraulic Jacks, etc.

Mill Rolls Ground and Corrugated. SEND FOR CIRCULAR.

**SAN FRANCISCO TOOL CO.**

Works, First and Stevenson Sts., San Francisco, Cal.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

**Golden State and Miners' Iron Works.**

Sole Manufacturers,

## Idaho.

(Continued from page 137.)

put the properties in a condition that regular bullion shipments and quarterly dividends will be the order of business at their office. Mr. Stanton, the superintendent, is well known in Colorado mining circles, and his experience in managing Clear creek bonanzas with the foundation he has to work on here will enable him to add to his laurels as a successful mining superintendent and make a paying and profitable system of mines out of this group for the fortunate owners.

## The Flint Group.

## EXPLANATION.

1. Leviathan.
2. Perseverance.
3. Belfast.
- 4 & 5. Star of the Evening.
6. Rising Star.
7. Rising Star North.
8. Sherman.
- 9 & 10. Not company mines.
11. Venus.
12. Garfield.
13. Rising Sun.
14. Argus.
15. Reduction works.

The above diagram will assist in giving the reader an idea of the position of the mines of the company. The distance between the main parallel veins is about 400 feet, more or less. Claims 9 and 10 are owned by Silver City people, and have a good showing in the way of ore body. Other locations, north and south of the group, are being opened up, and a number are showing excellent indications of being paying properties. If the management of the above group of mines opens the properties in the manner he contemplates, the future of the district will be an assured one and the income of the company, no doubt, a big one; but if he fools away time and labor in taking out and shipping ore instead of developing, the result will not be as satisfactory in the end.

## Perseverance and Leviathan.

These two claims are the two extreme eastern locations on the lower or western vein. Two tunnels, 10 feet apart at the surface, start in on each side of the dividing line, one on each claim, tapping the vein of both mines—the breast of the tunnels being some 60 feet apart where they cut the vein. A drift was run in on ore 100 feet south on the Leviathan, and the ore overhead stopped out. The vein matter in these claims varied from 2 to 12 feet wide, and run very high. Below, no ore was taken out worth mentioning. The ground is easily worked, and but little water to trouble with. A crosscut opened the vein and connected the end of the tunnels—this, also, all in ore. North of the Perseverance tunnel, 125 feet of a drift was made; an angle in the ledge left the north end of the drift some 30 feet west of, and parallel with, the vein. The new management has had the ground surveyed, and is now cross-cutting to the vein. That portion of vein that drift was run in on was stopped out above, but not below, so far as known. A tunnel will be started 80 feet below the twin tunnels of these mines, and will tap the Leviathan, and can be run north through the Perseverance; the tunnel will be continued until it taps the Rising Star, which it will do at a depth of nearly 300 feet. This tunnel will drain the four mines, and render the excavation of ore and waste from them but trifling in cost.

## Rising Star and Rising Star North.

These mines lie parallel with and directly east of and up the hill from the Leviathan and Perseverance, the veins being only about 400 feet apart. An 80-foot level above the Leviathan and Perseverance tunnel and on the end line between the two "Stars" has been run in 60 feet from the surface cutting the vein, which shows 11 feet thick at the end of the tunnel at a depth of 90 feet below the surface. South from the tunnel's end some 375 feet was opened by a tunnel into the Rising Star, and at the end of the tunnel a shaft some 300 feet deep, all in ore, was put down in years gone by. The ore above this 375-foot tunnel has been mostly all removed and the dirt and waste filled in. The new management in cleaning out this tunnel found a good bunch of ore overhead and below the tunnel about 250 feet from the surface tunnel's end that will run 485 ounces. How extensive this ore body left below the drift, no one knows. The cleaning out and re-timbering of these mines and getting them in shape to handle in a business-like, systematic manner is no small job, nor can it be done short of a good sum of money. The tunnel below the Perseverance and Leviathan to tap the Stars and tap the bottom of the 300-foot shaft down in the east end of the Rising Star will put the two Stars and the Perseverance and Leviathan in condition to develop to advantage and enable the company to extract ore in larger quantities and at less than one-half the cost of hoisting and working the mines through a shaft.

## "The Rest of 'em."

The Belfast, Star of the Evening, Rising Sun, Venus, Garfield, Sherman and the Argus, in addition to the above described, make the 11 claims of the company. The last seven mentioned are virgin properties with ore in sight in every one of them, while on a number of them, men are quarrying ore on the surface and sack-

ing the high-grade first-class ore, and storing the lower grade for concentration. The Star of the Evening shows up especially well, and work toward the extensions indicates that the large ore body will be found elsewhere as well as on this fine prospect. Considerable development has been done on the Garfield and Sherman by former owners, but not to an extent nor in keeping with the showing had as far as worked.

## The Plant.

The location for the concentrator is an admirable one, being below all the mines and but a short distance from the most remote. At present only a limited capacity of crushers and rolls, with two Golden Gate concentrators, will be put up by the company. The foundation for the plant is being laid so that the capacity can be increased to any extent desired. To begin with, 80 tons in 24 hours will be the capacity of the concentrators. The crushers, rolls and machinery have arrived and will be placed in position as rapidly as the foundation can be prepared. The property owned by these Nebraska folks is such that it can be made a lasting and a paying one if properly worked; or it can be successfully managed in a big stock deal. If the former course is pursued—and such appears to be the aim of the management—the benefits will not be confined to the stockholders but will extend to the entire district. In the event that a big deal should be made the end would be like many others have proved heretofore, and the drawback to this now reviving and deserving district would be sad to contemplate. I have every confidence that this district will be worked on its merits, and know that if it is so worked it will not be found wanting.

## Flint "Concentrates."

Wood and water are abundant. Laborers are paid 30 cents per hour. A "bit" gin mill opened up in camp recently. The sidehills are alive with miners and woodmen.

Flint has a sawmill. It is owned by the company.

It costs about \$45 per ton to ship ore from Flint to Denver, Col.

Colonel T. J. Jobs, a member of the Georgetown (Col.) bar, is a resident of the camp.

Kuna Station, on the Short Line, is 55 miles. Daily stage from Kuna to Silver City; fare, \$8.

Miners and carpenters are paid by the hour—receiving 35 cents per hour for 10 hours each day.

The two towering brick stacks, erected in '68, will be used by the company for their plant now going up.

No new men are being hired by the company. Miners in search of labor will not do well to come here at present.

The many tents on each side of the gulch, used by miners, give the place the appearance of a military encampment.

If Flint improves during the next few months at the pace it has during the past month, there will be an opening for some Democratic office-seeker, as the camp needs a postoffice.

Manager Stanton, of the Flint Group, is President of the Denver Society of Civil Engineers, and was the builder of the "Loop" of the Colorado Central, at Silver Plume, Clear Creek county, Colorado.

## Wagontown District.

There is some talk that the T. W. Jones 20-stamp mill at Wagontown, nine miles south of Silver City, is about to be changed into a concentrator by Colorado capitalists.

The miners of Wagontown district are pushing development on their best claims and gobbling up additional localities. Many of them are property poor and would give moneyed men a chance to develop for an interest.

The Webfoot, Ohio, Garfield and other mines near Wagontown, owned by Messrs. Adams & Jones, have been developed to an extent that has proved a number of them to be fine properties if handled by a company with capital.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. S. LUCE—Nevada and Placer Co.'s.

NEW MILLS.—The Frisbee-Lucop Mill Co. have shipped mills to Meadow Lake and to Columbia, Tolueme Co. Last Saturday they shipped two mills to the Quartz Hill Mining Co., Siskiyou Co. This company has ordered three more mills, which are now on the way from the East, with one large mill for the Golden Eagle Mining Co., of Butte Co. These mills are evidently rapidly gaining favor with mining men.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING AUGUST 17, 1886.

- 347,563.—CAR AXLE—J. Bourne, Jr., Portland, Oregon.  
347,479.—MOTOR—B. Elmore, Redding, Cal.  
347,705.—MOTOR—L. S. Goldman, Pasadena, Cal.  
347,592.—ELECTRIC BELT—Ira Gray, S. F.  
347,484.—CANDLESTICK ATTACHMENT—George Griswold, S. F.  
347,615.—SMOKE-CONSUMER—John Keane, S. F.  
347,721.—GANG PLOW—E. E. Krause, Rio Vista, Cal.  
347,722.—CULTIVATOR—E. E. Krause, Rio Vista, Cal.  
347,439.—BATH APPARATUS—W. F. Lambert, S. F.  
347,431.—VERTICAL SHAFT BEARING—I. P. Lambing, Ione, Cal.  
347,433.—ELEVATOR—A. J. McAdam, S. F.  
347,435.—KING-BOLT—T. A. McGovern, Bolinas, Cal.  
347,438.—ROCK DRILL—E. Moreau, S. F.  
347,368.—HOSE AND PIPE COUPLING—P. J. O'Connor, S. F.  
347,644.—STEAM ENGINE OR PUMP—W. C. Simon, Portland, Oregon.  
347,524.—SHOE FASTENING—J. T. Senteney, Blacksburg, Cal.  
347,455.—CARTRIDGE-LOADER—C. Wonacott, Murphys, Cal.  
347,333.—CAR AXLE—J. J. Kelly, S. F.  
NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Mining Share Market.

Little of interest occurred on the Comstock last week. Sandy rumors of improvement in both Hale & Norcross and Alta seemed to have an elevating influence on stocks in the respective mines, but the first mentioned improvement did not hold out or rush up fast enough, and the second was seemingly a small contest for the control at the annual meeting of the company, which took place in San Francisco August 19th. Now the stock is "a little off" again.

Another diamond drill hole is being run on the groo level of the Potosi east, near the Chollar line, says the *Enterprise*. It has already penetrated a distance of 225 feet, showing a very large ledge of pure, white quartz, carrying comparatively little in the way of the precious metals. Yet of such quartz, veins in the great body of the Comstock bonanzas are born. The 600 level of Savage continues looking and promising well in good ore. Some improved quality of ore has been coming from the lower levels of Consolidated California and Virginia, but nobody knows as yet what sort of an extent it is capable of.

The incline engine at the Crown Point shaft will not be repaired and completed before the 1st of next month, at which time it is definitely proposed to resume operations in both the Crown Point and Belcher mines. The low water in Carson river, causing some mill stamps to hang up for want of the requisite motive power, is a serious detriment to our mining interests and prosperity.

The usual progress of exploration and development is being made in all the principal working mines.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:  
Germania, August 17, \$5994 22; Hanauer, 17, \$11,490; Stormont, 17, \$2920; Hanauer, 18, \$5600; Queen of the Hills, 18, \$8000; Lexington, 18, \$22,768; Silver Bow, 18, \$18,659; Hanauer, 21, \$27,800; Crescent, 21, \$6330; Germania, 21, \$3212.29. The banks of Salt Lake City report the receipt for the week ending August 18th, inclusive, of \$118,039.70 in bullion and \$78,675.70 in ore, a total of \$196,715.40.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## New York Metal Market.

Telegraphic advices dated August 26th give the following New York prices:

BORAX—6¼@7¼c.  
 BAR SILVER—91½ per oz.  
 COPPER-LAKE—\$10.25@10.50.  
 IRON—No. 1, \$17@18.00; No. 2, \$15@16.00.  
 LEAD—\$4.75@4.80.  
 QUICKSILVER—50½@52¢ per lb.  
 The following is the latest by mail from the "New York Metal Exchange Market Report":  
 COPPER—Easier, closing fairly steady at 10.20c @10.35c spot Lake, 10.45c@10.65c late futures. Transferable Notices (Lake) offered at 10.20; Transferable Notices (Chili Bars) offered at 1.39 1/5.  
 LEAD—Nominal at \$4.75@4.80c. Transferable Notices (Domestic) issued at 4.75.  
 TIN—Steady, closing at \$21.60@21.75. Transferable Notices issued at \$21.65c.  
 SILVER—New York, 91½ per oz. London, 42¼d. MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18@18.50; No. 2, \$17.00@17.50; Grey Forge, \$15.00@16.00. Hudson River, Grade No. 1, \$18@18.50; No. 2, \$17.00@17.50; Grey Forge \$15.00@16.00. Southern, Grade No. 1, \$18.00@18.50; No. 2, \$17@18.50; Grey Forge \$15@16.  
 Prices generally rising for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.00@22.25; Billiton Tin, \$22.00@22.25; Banca Tin, \$21.15@21.50; Baltimore Copper, \$9.25@9.40; Orford Copper, \$9.35@9.65; P. S. C. Copper, \$9.35@9.65; Foreign Lead, \$4.75@4.95; Foreign Spelter, \$4.70@4.75.

## Ore Feeders.

We call attention to a new advertisement, which appears in this issue of our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

We herewith subjoin a copy of a letter shown to us by a representative of those works, which speaks for itself:

BUNKER HILL GOLD MINING CO.,  
 AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no one can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,  
 (Signed) N. W. CROCKER, Supt.

## DIVIDEND NOTICE.

OFFICE OF THE  
 Paradise Valley Mining Company  
 San Francisco, California.

At a meeting of the Board of Directors of the above-named Company, held August 24, 1886, Dividend No. 8, of Twenty-five (25) Cents per share, was declared payable on Wednesday, the 25th of August, 1886, at the office of the Company.  
 W. LETTS OLIVER, Secretary.  
 OFFICE—No. 328 Montgomery St., San Francisco, Cal.

**SOLICITORS.**  
 252. MARKET ST. S. F.  
 ELEVATOR 12. FRONT ST. S. F.

THE ORIGINAL  
Roller Ore Feeder.

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."  
 Prices furnished by the  
**JOSHUA HENDY MACHINE WORKS,**  
 39 to 51 Fremont St., San Francisco.

## MILL SUPPLIES AND LUBRICATING OILS.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 &amp; 106 Washington St., NEW YORK.

One of the Fullest, Freshest, and Most Valuable Handbooks of the Age. Indispensable to every practical man. Just Ready. Price, \$2.00. Free of Postage to any address in the world.

## THE Techno-Chemical Receipt Book:

Containing several thousand Receipts covering the Latest, Most Important, and Most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Eisner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling, with additions by William T. Brant, Graduate of the Royal Agricultural College of Elders, Prussia, and William H. Wahl, Ph. D. (Heid.), Secretary of the Franklin Institute, Philadelphia; author of "Galvanoplastic Manipulations." Illustrated by 78 engravings. One volume, over 500 pages, 12mo., elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price, \$2.00, free of postage to any address in the world.

ABSTRACT OF CONTENTS: Adulterations, Imitations, etc. How to Detect Them; Alloys; Artificial Gems, Pearls, and Turkish Beads; Bitters, Cordials, Elixirs, Liqueurs, Ratafias, and Essences, Extracts, Tinctures, and Waters Used in their Manufacture, and the Manner of Coloring them; Blasting Compounds, Blasting Powder, Dynamite, Gun Cotton, Gunpowder, Nitro-Glycerine, Fulminates, etc.; Bleaching; Boiler Incrustations; Bone, Horn, and Ivory, to Bleach and Dye them, and make Imitations and Compositions; Bronzing and Coloring of Metals; Building Materials; Artificial Building Stone, Mortars, etc.; Cocoa and Chocolate; Celluloid, Caoutchouc, Gutta Percha, and Similar Compositions; Cements, Pastes and Putties; Chemical and Techno-Chemical Expedients, Preparations; Cleansing, Polishing, and Renovating Agents; Colored Chalks, Crayons, Pencils, and Inks for Marking Linen, etc.; Confectionery; Copying and Printing; Damascening Steel; Decoration, Ornamentation, etc.; Dentifrices and Mouth Washes; Dyeing Woolen and Cotton Goods, and Yarns, Silk, Straw Hats, Felt Hats, Kid Gloves, Horsehair, etc. Mordants; Electro-Plating, Galvanoplasty, Gilding, Nickeling, Silvering, Tinning, etc.; Enamels and Enameling; Feathers, Ostrich, Marabouts, etc., how to Wash, Restore and Dye; Fire-extinguishing Agents and Means of Making Tissues; Wood, etc. Incombustible; Fireworks; Food and Food Preparations; Freezing Mixtures; Fruit and other Syrups; Fuel and Heating, Heat Insulation (Non-conducting coverings); Fusible Colors used in Porcelain Painting; Glass, Composition of the various kinds of, Colors for, and Processes for Enameling, Engraving, Gilding, Silvering, Pulverizing, Filing, Bending, etc. Glazes for Earthenware; Glass and other Signs; Glue, Manufacture of; Household and Rural Economy; Illuminating Materials; Imitations, Substitutes, etc.; Indigo, Indigotine, and Alizarine; Inks, Lithographic, Printing, and Writing; Jeweler's Polishes; Lacquers and Varnishes; Leather, Tanning and Dyeing, including Furs, etc.; Liquors and Beverages; Beer, Brandy, Gin, Whisky, Wines, etc.; Lubricants for Machines; Waxes; Marine Glue; Matches; Metal Industry; Mustards; Oils and Fats, Animal, Vegetable, and Mineral; Oil Paintings; How to Cleanse, Pack, and Varnish them, and to Restore Gilt Work; Paints and Pigments. Grinding and Mixing Colors, Graining, Imitation of Marbles; Paints and Washes for Various Purposes, etc. Paper and Paper Materials, Manufacture, Staining, etc.; Glass, Sand and Emery Paper; Perfumery, Aromatic Vinegars, Cosmetics, Extracts, Hair Oils, Pomades, Powders, Washes, Fumigating Articles, etc.; Pharmaceutical preparations; Photography; Plaster of Paris Casts which can be Washed; Preserving Meat, Milk, Vegetables, Vegetable Substances, Wood, etc., and Preservatives; Sealing Wax and Wafers; Sho-Blacking, Dressings, etc.; Sizing and Dressing for Cotton, Wool, Straw, etc.; Soap, Hard and Soft Soaps, Medicated and Toilet Soaps, etc.; Soldering and Solders; Sugars, Glucose, etc.; Textile Fabrics and Tissues; Tobacco, Smoking Tobacco, Snuff, Stenuative Powders, etc.; Vinegar. Manufacture of Ordinary and Fine Table Vinegars; Washing and Scouring, Manufacture of Washing Blue, etc.; Waste and Offal, Utilization of; Water-Glass (Soluble Glass) and its Uses; Water-proofing Compounds; Wax and Wax Preparations; Wood Gilding, Polishing, Staining, etc.; Yeasts, Manufacture of Pressed Yeasts, Bakers' and Brewers' Yeast, etc.; Addenda. Alloys; Antiseptic and Preservative Agents; Artificial Eyes, Manufacture of; Asbestos and its Uses; Bleaching; Bookbinding, Gilding, and Ornamenting; Bronzing; Gilding, Silvering, etc.; Building Materials, Celluloid, Imitations, Substitutes, etc.; Cement Work; Cleansing, Polishing, and Renovating Agents; Colors, Enamels, Cements, Glue, Varnishes, Water-proofing Substances, etc.; Copying; Explosive Agents; Glass; Horn Combs, Manufacture of; Lubricants, Blacking, etc.; Metal Industry; Miscellaneous; Oils and Fats; Paper; Straw, Bleaching and Dyeing of; Strength of Materials; Willow-Ware; Index.

A circular of 32 pages, showing the full Table of Contents of this important book, sent by mail free of postage to any one in any part of the world who will furnish his Address.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

**BALFOUR, GUTHRIE & CO.,**  
316 California St., San Francisco.

## FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 220 Fremont St.,

MANUFACTURERS OF

San Francisco.

BABCOCK & WILCOX BOILERS.

MARINE ENGINES AND BOILERS—  
Propeller Engines, either High Pressure  
or Compound, Stern or Side-wheel En-  
gines.

MINING MACHINERY—Hoisting En-  
gines and Works, Cages, Ore Buckets,  
Ore Cars, Pumping Engines and Pumps,  
Water Buckets, Pump Columns, Air Com-  
pressors, Air Receivers, Air Pipes.

MILL MACHINERY—Batteries for  
Dry or Wet Crushing, Amalgamating  
Pans, Settlers, Furnaces, Retorts, Con-  
centrators, Ore Feeders, Rock Breakers,  
Furnaces for Reducing Ores, Water Jack-  
ets, etc.

BABCOCK AND WILCOX BOILERS.

ICE AND REFRIGERATING MA-  
CHINERY.

MISCELLANEOUS MACHINERY—  
Flour Mill Machinery, Saw Mill Engines  
and Boilers, Dredging Machinery, Pow-  
der Mill Machinery, Water Wheels.

## ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish  
Tanks for Salmon Canneries  
OF EVERY DESCRIPTION.

Boiler Repairs promptly attended to and at very moderate rates.

NEW YORK OFFICE, 18 BROADWAY  
Room 709.

A Good Opportunity for a Ma-  
chinist.

A variety of good Tools, Patterns, etc., with business  
for sale cheap by a party retiring from business. A  
splendid opportunity for an enterprising mechanic.

Address A. B. C., care of this paper.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.**  
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our  
**IMPROVED  
HYDRAULIC  
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

## QUARTZ BREAKERS! San Francisco Cordage Factory.

## PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning  
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

T. E. JEWELL, Sole Agent,  
330 Pine St. (Room 4) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

## THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

1850.

1885.

**RANKIN, BRAYTON & CO.,**  
BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

### WATER JACKET SMELTING FURNACES

### THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

### HOISTING WORKS.

Rock Breaker, . . . . 100.00  
Quartz Mill, . . . . 350.00

### THE JAMES QUARTZ MILL

Saves a Higher Percentage than any other machine.

Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the WHOLE WEIGHT and FORCE OF BLOW ACTS ALTERNATELY ON EACH DIE. In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

## Water-jacket Smelting Furnaces.

In our issue of August 21st we gave an illustration of one of the water-jacket smelting furnaces used on this coast for smelting oxidized and other copper ores. In the present issue we continue that class of illustrations and show a front and half-sectional view of another furnace, known as the Raschette copper furnace. In the construction of the same, improvements have been introduced which now represent the most advanced practice in copper smelting. Instead of depending on a number of small round furnaces, a rectangular furnace 32 inches wide, 72 inches long, was erected, as shown in Figs. 1 and 2. The construction is as follows:

There are two water-jackets, the upper one, *B*, in Fig. 1, supported by the pillars, *L*, the lower one, *A*, resting on the bed-plate carried by the pillars, *K*. The crucible, *C*, is lined with brick and clay, like those of the round furnaces, and can be cleaned by the falling of the drop-doors, *D*. *H* are the tapping-notches; *M*, the cinder-notches; *F*, the tuyeres supplied with blast from the blast-main, *E*; *R*, blow-off cocks in the lower water-jacket. The water for the upper jacket enters through the system of pipes, *Q*, more distinctly shown in Fig. 2, and is discharged through the pipes, *P*, into the gutter, *K*, which also carries off the spent water from the lower jacket, *A*. The upper part of the furnace is surrounded by the shell *O*, and contains a charging-bell and hopper, which is elevated or lowered by the levers, *V*. This charging-bell has now been removed, and in its place a simple charging-hopper has been substituted like the hopper used in the furnaces of the Grant Smelting Works, at Denver, Col.

The character of ore smelted in this furnace is entirely similar to that smelted in the furnaces of the Arizona works.

The capacity of this Raschette furnace is about 60 tons per day, and a saving of about 10 per cent of the fuel above that used in the operation of round furnaces has been noted. It requires no more men to operate this furnace, and on the whole there should be a decided saving in the cost of the treatment of ores, as compared with the smaller round furnaces. At the rates ruling for labor and fuel in the Clifton district, the cost of treating ore in this furnace is about \$8 a ton.

## Mining Accident Funds.

In Great Britain they have in various districts mining accident funds, which are devoted to the relief of those injured in mines, or the widows of those killed. At some places these funds have increased largely. The Hartley colliery fund, for instance, now amounts to about \$100,000. A scheme is now being considered for centralizing mining accident funds by a committee. Before a disposition of the money can be made, the scheme will have to be submitted by the various colliery districts, which will enable the Home Secretary to make a just and equitable division. To centralize these funds and enable the miners to have a reliable relief fund which they can bring before the Home Secretary to secure a portion of the surplus, it is now proposed to establish a Permanent Miners' Relief Fund. All surplus funds could then be added to the Miners' Accident Fund and invested in the names of trustees. Both employers and colliers are expected to contribute to these funds.

## Gold-washing in Italy.

Washing for gold has been practiced from time immemorial in Piedmont, in the beds of some of the torrents which flow from the Alps to the Po.

According to Pliny and other ancient writers, upward of 5000 persons were engaged in this occupation at one time. In modern times, however, it has only been practiced on a small scale, and principally in the beds of the torrents Orco, Malene, Dora Baltea and Ticino.

Of late years, the existence of these aurifer-

ous meters of stuff per day of 22 hours. The buckets are 22 in number, and are capable of excavation to a maximum depth of 8 meters.

## A Maritime Exhibition.

An international maritime exhibition will take place at Havre next year. Ships and appliances that will be admitted are as follows: Sailing or steam ships of all nations (men-of-war and merchant vessels); fishing boats, pilot boats, life boats, yachts, pleasure boats, and boats for

Fig. 1.—Side Elevation and Vertical Half-section.

Fig. 2.—Front Elevation.

RASCLETTE COPPER FURNACE.

ous sands has been more fully investigated, and have been found to extend at the foot of the Alps from Legin and St. Maurizio on the west to the Dora Baltea on the east, and bounded on the south by the Po, covering an area of about 250,000 acres.

The depth of this gold-bearing deposit varies from 5 to 8 meters; and although the amount of gold these sands contained cannot be said to have been ascertained with any degree of accuracy, there appears to be every reason to believe that the estimate of 0.40 grains per cubic meter is not an exaggerated one. (0.01286 Troy ounces; 0.2572 dwts.)

A company—the "Societa dei Giacimenti Auriferi di Pienionte"—have recently commenced operations in the bed of the torrent Orco, near San Benigno, and a few weeks ago inaugurated a powerful steam dredger, named the "Regina Marghousa," which has been constructed especially for the excavation and washing of these sands; it is of 50-horse power, and is capable of raising from 2000 to 2500 cu-

bic meters of stuff per day of 22 hours. The buckets are 22 in number, and are capable of excavation to a maximum depth of 8 meters.

Owners or captains are to give names of builders and fitters, date of launch of ship, dimensions and all particulars concerning hull and engines. Prizes will be given both for construction of vessels and their fittings. Ships must remain at least a week in the exhibition dock.

In view of the fact that there is now so much rivalry between this country and England in the matter of yacht models, it is to be hoped that a number of the various types of both countries will be exhibited at Havre. There are many good points that each might adopt if seen where comparisons could be made. For steamships no doubt Great Britain will excel at this exhibition, but the United States ought to make some kind of a showing, as she is a maritime nation, even though our navy is not quite up to the mark.

## Care of Mine Cables.

There is probably no more important feature in the economies of a large mine than the care which is given to the mine cables. Upon their condition depends often the lives of the men who trust themselves in the cage or in the mine. One would think, therefore, that the cables would receive the greatest attention and care. And so they do, each large mine having a rope-man, whose duty it is to make a daily inspection of the cable, repair it, lubricate it, tar it, and report its condition to the superintendent. This rope-man is responsible for the condition of his ropes, and his position is therefore an important one. It occasionally happens, however, that the spirit of economy prevails to such an extent that the superintendent insists on running longer than the man who has it in charge and knows its condition thinks proper, or the rope-man tries to keep patching up his old material to save ordering a new cable; therefore we occasionally, though not often, hear of serious accidents from breaking cables.

The cables, in order to preserve them from the effects of dampness and heat, must be lubricated and tarred. In very hot and wet shafts or inclines the cables do not last as long as in cool, dry ones. In using tar in hot shafts, the tar runs and makes more or less dirt. Under some circumstances the tar when old gets brittle and chips off. In some large mines the ropes are changed once every month or two months, the one removed being put in thorough order before being put in use again. Too great care cannot be taken of these important portions of mining operations. There are several patented systems of cleaning and preserving cables, and almost every rope-man at a large mine thinks his method the best.

## Gold in Germany.

The following figures give the gold production of Germany for a number of years:

	lbs.	lbs.
1849	5.72 1863	101.20
1850	8.36 1864	92.62
1851	20.68 1865	77.88
1852	29.92 1866	231.22
1853	42.90 1867	186.56
1854	28.38 1868	253.22
1855	34.54 1869	173.80
1856	19.14 1870	149.82
1857	32.34 1871	181.06
1858	33.44 1872	720.50
1859	45.10 1873	639.00
1860	34.80 1874	863.22
1861	62.70 1875	731.06
1862	21.56 1876	618.86

The gold occurs in lead and copper ores in very minute quantities. The gold produced in Prussia, which is a very small quantity, is obtained by an interesting process. The peroxide of iron, obtained in roasting the arsenical gravel, is impregnated with chlorine gas, washed with water, and the gold contained precipitated with sulphuretted hydrogen. The resulting sulphide of gold is roasted, washed with hydrochloric acid, and smelted with borax and nitre.

GRANITE MOUNTAIN.—In our article last week on "Investment in Mines," we mentioned the Granite Mountain mining stock as selling at the rate of \$6,400,000 on \$40,000 monthly dividends. This was taken from an old report. The dividends are now \$100,000 per month, and the stock is firmly held at \$40 per share, and there are 400,000 shares, which makes a valuation of \$16,000,000. Trustworthy reports and honest management account for this solid, confident appreciation of this stock.

### The Mechanics' Institute Fair.

The annual exposition of the Mechanics' Institute is now in progress in the grand pavilion in this city, and will continue to be the center of attraction in the city for a month. The space is well occupied with a great variety of industrial and art materials, natural productions of every kind, etc. It is too late to prepare any sketch of the fair for this week's PRESS. Let our readers note the fact that it is now in readiness for their visits. For those who cannot come we shall record our notes of the exhibition hereafter.

The opening exercises at the Grand Opera-house began at 2 o'clock Tuesday afternoon, Aug. 24th, with a grand opening overture by the orchestra under Charles Schultz. Rev. Joseph P. Macaulay made a short prayer, after which there was more music by the orchestra.

#### Ramon E. Wilson's Address.

P. B. Cornwall, President of the Mechanics' Institute, in a brief address introduced Ramon E. Wilson, who spoke as follows:

*Mr. President, Ladies and Gentlemen:*—For the twenty-first time the friends and patrons of the Mechanics' Institute assemble to celebrate the opening of its annual industrial exhibition. This large concourse of people is a most fitting tribute to the ceremony, and it speaks stronger than language can express the feeling and sentiment of the community as to its success.

#### Origin of Industrial Exhibitions.

Industrial exhibitions are now fully recognized as a method of assisting the development of industries and material progress. As exhibitions purely, they are of comparatively recent date. For the purpose of effecting sales of the productions placed on view they have an origin which antedates modern history.

This latter class were called "Fairs," held at stated intervals both in Asia and Europe, in the earliest period of civilization. They are supposed to have derived their origin in religious gatherings, which first gave an opportunity for the exhibition and sale of wares to large numbers of people. The Greeks and Romans have left accounts of many such.

We find in some of the earliest text-books of the law that these institutions had become so important that special courts were established for the consideration and determination of questions of law and equity arising at them.

Fairs were instituted in France and in Southern Europe some 1000 years ago. Among the more celebrated of those early times was that of St. Denis, instituted by Dagobert, A. D. 629, and Aix-la-Chapelle and Troyes in about A. D. 800. In A. D. 826 they were introduced into Great Britain by Alfred the Great. At the end of the tenth century they had become well established and very common throughout Northern Europe.

In Great Britain patents were issued by the king, permitting the establishment of annual fairs. Some of these have become famous. The English fair at Weyhill is noted for its display of sheep; that of St. Faith's is distinguished by the numbers of Scotch cattle bought and sold, and everybody has heard of the Donnybrook fair, so long celebrated for the jollity and pugacity which distinguished its visitors.

In France the fairs of St. Denis were discontinued. Beaucaille and Gibray have been in existence for centuries.

Fairs are still held in Holland and are enjoyed by the people as important holidays.

Germany is known as the modern home of this peculiar institution, the principal ones being those of Leipzig, Frankfurt-on-the-Main and Brunswick.

In Russia the fair is the largest in the world, lasting 25 days, and the sales amount to many millions of dollars.

In Asia the fair held at Mecca, when the annual pilgrimage takes place, is the most extensive. One of equal magnitude is held in India on the Ganges, where a million people assemble annually.

On the Western Continent no such great assemblages, with but rare exceptions, are known. In early times fairs were held at the City of Mexico, frequently attracting many thousands of people.

In later years these fairs have been less required as a means of promoting commerce, owing to the facilities afforded buyers and sellers by the modern means of transportation and travel, which permits trade to be carried on with regularity and convenience throughout the year. The necessity of accumulating products of manufacturing and transporting them in quantities to the fairs, to be wholly sold in a few days, no longer exists. Their production is continual and their sales go on uniformly and promptly at all seasons.

This change in the methods of commerce has led to the institution of the industrial exhibitions, at which the object is not to procure the sale of exhibited articles, but to make visitors familiar with their character and value, and to inform them of the places of manufacture and sale, with the ultimate result of bringing the purchaser to the manufacturer and merchant, and by a course of object-teaching educating the masses in the progress of the age and the growth and development of the country.

The first of these exhibitions is supposed to have been held in France. Similar ones were

held in Great Britain by the Royal Dublin Society nearly a half century ago. The American Institute of New York commenced holding its exhibitions a little later, and still later, just a quarter of a century ago, the first exhibition of the Mechanics' Institute of San Francisco was held. They have continued annually ever since, and it has now become one of the permanent institutions of the country.

#### The Mechanics' Institute.

The Mechanics' Institute was organized in January, 1855.

Its founders declared its objects to be to cultivate a social feeling of friendship, mutual improvement, the dissemination of information and useful knowledge by the establishment of a library of circulation and reference, and the erection of buildings for any scientific, mechanical or literary purpose.

Right worthy objects they are. What a wonder it must be to those schemers now living to see the most perfect realization of their designs. What a contrast between the library of 40,000 volumes now upon the shelves, devoted to and representing every subject to which the human mind has given thought or tongue utterance, and the "library of circulation and reference" in San Francisco in 1855.

Ten years later they must have accumulated a library, for in the year 1865 was inaugurated the first of its industrial exhibitions. It would be a curious and instructive spectacle could we arrange the fair of 1865 side by side with the fair of 1886.

Not unlike many other things, the "glorious climate of California" has had its influence upon this institution, and although it was born amid the fogs and trade winds of San Francisco, and has its local habitation here, it has grown to such magnitude that it exerts a power over the development of all that is strongest and best throughout the whole commonwealth. Its capacities and capabilities will not decrease, for its fountain source is a pure spring unpolluted by selfishness and undisturbed by narrowness.

Its 31 years' growth has been unassisted by a single dollar from the public treasury, not a dime by gift, nor a penny from endowment, and not even a lottery.

It is indifferent to sects, creeds and parties. Its members and coadjutors are now composed of all parties, sects and denominations, without distinction of creed or political sentiment, until now it stands entirely above and secure from all convulsions of political contests, not dependent upon the success of one party or another, but all equally willing and anxious to form the pillars of its support, while it operates in a different sphere and extends its exploring vision far beyond the arena of party measures or political action, penetrates the mysterious work of God in the government of the material world, and draws down permanent accessions to the common stock of human enjoyment.

Its history presents a phase, not unlike that in the lives of some men, who have become great in the many walks of life through their own exertions.

The public, recognizing the permanent and abiding character of its works and the self-sacrificing enthusiasm with which its pioneers press on the enterprise, that its achievements are for the benefit of the country, has gradually become impressed with the sense of its importance and yielded co-operation.

It is now the great vanguard of the pioneers of substantial and practical improvements in all the useful occupations and employments of life.

The men who founded it, as well as those who have succeeded, and who now direct its policy and affairs, have never sought their own glory in its establishment nor their own advancement in its growth.

Who will not delight to cherish the warmest emotions of gratitude for these veteran patriots? They deserve the thanks of the whole country.

#### The Influence of its Fairs.

The primal object of this great institution is to expound and illustrate the laws of nature, as exemplified by the various industries, and to produce therefrom new and useful things for the practical application and use of the human race. This it accomplishes by the aid of volunteers from the ranks of science and art and all the departments of industry. It demolishes the barriers which obstruct the progress of the age, breaking down the inclosures of Nature's storehouse and letting mankind in to the enjoyment of constant accessions of novelties and wonders.

Its great productive forces, as applied to mankind, are emulation and stimulation.

Within its capacious receptacle are the products of the fields, the factories, the shops, the farm, the manufacturer, the mechanic, and the inventor. Hither they all come with the productions of their skill, to witness the grand tournament of genius, the great trial of inventive strength, to compete for premiums, and through them for the patronage of the public. Emulation, constantly excited as it is by these exhibitions, and urged on to increased exertion, results in the production of fabrics and works of handicraft which can only be excelled by the continued application of the same stimulating process. The products of skill, labor and ingenuity are brought to the immediate view or critical examination of thousands of observers. It is a better advertisement than daubs of paint on all the fences in the country.

These fairs are the grand exchange of the ingenious and enterprising producers of the country. Here they are brought together,

many of whom would not otherwise ever meet, and interchange ideas.

The farmer comes to see what improvements have been made in agricultural implements. He finds them all in active operation, and has an opportunity to test their merits.

His wife comes with him. The latest devices in incubators, washing machines, churns, and the innumerable things which tend to lessen the work of the farmer's wife, are spread out before her. And perhaps the daughter comes too. Her mind is speedily stored with the beautiful things she sees among the finer arts and works of handicraft, which she utilizes to make the country home more home-like and attractive.

Hither comes the miner. He stops not to look to the right or to the left, but goes straightway to the rear, where all is noise and bustle. Here he finds the newest inventions for crushing ores—concentrators, separators, pumps and labor-saving drills. By their aid he finds that he can unlock the doors which lead to nature's repository, the storehouse of its precious metals. Mines upon which have been expended the fortunes of men without material results are again opened and made to yield up their hidden treasures. Hither comes the artisan, the carpenter, the mechanic, the blacksmith and the various workers in wood and iron, who find new tools and devices with which to lessen the burdens of their daily labor.

Hither come the vineyardist and the orchardist. By walking from one end of the long tables to the other, upon which are placed the various products of the tree and the vine, one can, without expense of time or money, make a visit to almost every county in the State and note with profit to himself what might take years of experience to learn, the various effects of soil and climate upon production.

Hither come the manufacturer and merchant, the one to display his products and the other to learn that he need not go beyond the boundaries of the State to find material to supply his customers.

Hither come the artist, sculptor and skilled handicraftsman to show to the wealthy and refined good people of our State that they need not go to New York, or Paris, or Rome, to buy good pictures; that mantles with carvings and tiles, rugs, carpets, furniture, portieres, pianos, wall-paper and decorations and all the other many articles which go to beautify the dwelling-place can be bought, and that clever workmen can be had at home.

Hither come the representatives of every class of human work, of man's labor and ingenuity, to use and compete with each other in the struggle for development, prosperity and success.

Hither come the masses of the people, who have no time to inform themselves from books or papers. The days and nights of exhibition are to them a grand holiday. It is a rest from the cares and burdens of life. It provokes energy and ambition. They see what would otherwise never be seen by them, and are taught what they would never otherwise know—the improvement of machinery—the encouragement given to commerce, the perfecting of rural economy—that men are rewarded for their labor—and the advancement, development and growth of the wealth, intelligence and comfort of the people.

And last but not least come the ladies, without the presence of whom no industrial exhibition can or ought to be a success. Homage is their due, for always they are the earliest and firmest friends of whatever tends to elevate, ameliorate and perfect the happiness, the comforts and the prosperity of the human race.

Who can measure the amount of pride and exultation felt by the exhibitors? Who can measure the amount of laudable ambition engendered by the complimentary observations of the multitudes who gather at these exhibitions? Who can measure the renovating power upon public opinion?

#### The Future.

The remark is sometimes heard that each exhibition is the same as the preceding one. Such speeches are thoughtlessly and carelessly made. As evidence of it, the very people who make them buy a season ticket and come to the fair every night so long as it lasts. The public does not think so, for yearly the coffers of the institute are increased, its exhibitions are enlarged and the value of its prizes, premiums, medals and awards enhanced.

The Mechanics' Fair has become one of the solid and permanent institutions of the country and the pride of its citizens.

How could it be otherwise? There is no tract of country on the face of the earth that can compare with our own State and coast as a birthplace for everything that is promoted by agriculture or the outgrowth of inventive genius—the pillars which form the foundation of every industrial exhibition and upon which repose the prosperity of the human race.

There is enough material on hand and in sight to keep this exhibition alive and useful for generations to come; nor will it be exaggeration or arrogance to say that within the lives of those here to-day the entire block of land, now owned by the institute, will be covered by one roof, filled with evidences of the inexhaustible resources of the State.

Some doubt this. It is said that the soil, like the human frame, will wear out and refuse, after a time, longer to yield to cultivation. That all of the available precious and other metals have been taken out; that, in view of the wonders already wrought, the secrets of nature are well-nigh exhausted. They ask

what is there left to do? The elements have been pressed into service and made to perform labor. Oceans have been contracted and their opposite shores brought within a few days of each other; the wind and the wave have been trained to the car of industry; steam has been imprisoned, and its angry efforts to escape have been applied to the generation of power; vision has been protracted through the aid of glass until it has penetrated the firmament and scrutinized its structure, and the lightning has been enslaved and city is made to talk with city at the speed of sunbeams.

Think of the immeasurable distance between God and man, and that the power to create is infinite with the Creator of the endless divisibility of particles of matter, and into the phenomena and laws of nature, and the answer must come, there is food for thought and enough for idle hands to do for all time.

California is blessed with a rich, deep and varied soil, a genial climate, a vigorous and intelligent class of men, unequaled in the spirit of enterprise, industry and perseverance, a splendid system of public instruction, and exalted by moral and religious institutions. Her earth teems with rare and useful productions, embosoming inexhaustible mines of metals and bearing mighty forests.

Commanding all these resources, no one need be solicitous of the future.

The rising generation need not be awed by what has been done. Let it turn its attention to the subject of irrigating the arid regions of the State, the reclamation of the millions of tule, marsh and overflowed lands lying in the great valley and bay region; to devising methods of increased production of fruits, vegetables and cereals, variety of production, the improvement in the breeding of cattle, horses, sheep and swine; improvement in machinery which agriculture naturally develops, a means of extracting from the mountains of gravel the gold therein, without polluting the highways which empty into the valley basins below, and to make a key which will unlock Nature's laboratory, wherein are stored more riches than have yet been found.

The friends of "the good old way" are getting to be very few. The spirit of progress is continually pointing out a "new way."

That is the spirit inculcated by these exhibitions.

Friends, join hands in laying deep and everlasting the foundations of this institution. It has already done ineffable credit to its projectors—let it be venerated by a grateful posterity, and let us hope that it shall continue to do good, and last as long as our Golden Gate is open to the commerce of the world.

The address of Mr. Wilson was followed by a laughing song, "Manon Lescant," by Miss Ellen Coursen and the Young Ladies' Choral, after which Fred Emerson Brooks read an original poem. The exercises closed with a cornet solo by Mr. Mahood, a chorus from *Lucia di Lammermoor* by the Choral, and music by the orchestra.

### New Concentrators in Arizona.

The concentrators of the Arizona Copper Company are now completed. The works are located adjacent to the smelters, and are about ready for operation.

The Clifton *Clarion* says: The arrangement throughout is convenient and everything has been done to make the works compact, secure and as far as possible self-operating. The ore to be concentrated is taken by car from the bins and dumped on screens which separate the fine and coarse, allowing the two classes to pass into separate bins. The fine ore, not needing crushing or rolling, passes automatically to the elevator and is carried direct to the revolving screen; the coarse ore is passed through a crusher, and then over a second screen which separates the fine particles and allows them to be carried likewise to the revolving screens, while the coarser ore passes through the Cornish rollers and is again crushed. It is then carried to the revolving screens, and by a simple arrangement, the coarser particles are separated and returned to the crusher to be reduced to the proper degree of fineness, when a second time they are raised to the screens.

The revolving screens are three in number and separate the concentrates of different degrees of fineness which pass from thence to the jigs, of which there are eight. These jigs are so arranged (on the principle of the different specific gravities of the bodies) that the concentrates, the middlings, which require further concentrating, and the gangue may be removed separately. The concentrates by a series of conduits are conveyed to a vat, where they are raised by an elevator and thence carried by a chute to a bin near the smelter, at the end of the chute a sort of screen being placed which separates the water from the ores and prevents it reaching the bin. The middlings are carried to the crusher and the process of concentration repeated with them. The gangue or waste is carried to the river and dumped. The whole arrangement is automatic as far as possible and every arrangement has been made to insure economy and convenience in the workings. The construction has been under the supervision of Mr. Colquhoun, Mr. Kemper representing the Kansas firm having the contract, and Mr. Schumann, one of the old employees of the Arizona Copper Company, having charge as foreman of the work, and in this, as in all his work, making thoroughness and solidity specialties.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**MOTOR.**—Benton Elmore, Redding, Cal., assignor of one-half to Fred. Grotefend, of same place. No. 347,479. Dated Aug. 17, 1886. This motor is designed for operating various machinery, but especially for working pumps. The motor is made up of an arrangement of a swinging pendulum and a suspended weight for developing the power, gears for transmitting the power from the weight to the pendulum, a peculiar connection between the pendulum and the pump pitman, and a novel mechanism by which the power of the gears is transmitted to the pendulum. The machine is a simple, practicable and effective power mechanism for driving such machinery as pumps, etc.

**CANDLESTICK ATTACHMENT.**—George Grisel, S. F., assignor of one-half to C. C. Volberg, of same place. No. 347,484. Dated Aug. 17, 1886. This attachment is for the purpose of receiving candles of any size and fitting them, by means of its own adjustment, in the candlestick. The candlestick itself may have its socket too large or too small for the particular candle, and in such a case the attachment, which will receive any candle, and will also fit any size of socket of candlestick, acts as a go-between, as it were, between the candle and the candlestick. The attachment consists of disks or plates having wires fitted through them and bent in such a manner that the upper portion is adapted to receive and hold the candle, while the lower portion enters the socket of the candlestick and by pressing against its walls holds the entire attachment in position.

**ELEVATOR.**—Alexander J. McAdam, S. F. No. 347,433. Dated Aug. 17, 1886. This is a ram elevator. There are many points of the invention which, unitedly, tend to make the elevator one of the most complete and safest of this, more than usually safe, class of elevators. One of the objects of the invention is the arrangement of the mechanism in a solid and compact form, located entirely out of the way. By an arrangement of tackle mechanism, the ram itself moves only through a short distance, but this movement is multiplied sufficiently to take the cage through the requisite height. There are provided safety appliances for the cage in case this tackle mechanism should break. One of the most unique of these appliances is the hoisting chain itself, which is so housed that it cannot collapse, but in case of a break becomes a rigid bar and supports the cage.

**KING-BOLT FOR VEHICLES.**—Thomas A. McGovern, Bolinas, Cal. No. 347,435. Dated Aug. 17, 1886. This invention, as its title implies, applies to the running gears of vehicles, and it consists in a king-bolt having a spherical head which is journaled or mounted in a spherical socket properly constructed under the bolster. The king-bolt itself merely passes through the axle. By such a construction as this the bolster is allowed a universal movement around its ball and socket joint, and this is peculiarly advantageous to vehicles and especially those which have two or more reaches, as it relieves them from all strain and twisting, incident upon the four wheels of the vehicle passing over irregularities in the surface of the ground. The wheels may rise and fall so that the front axle will take various angles with relation to the bolster, the bed of the vehicle, and the rear axle, without putting any strain upon these parts, and without bringing the plates intermediate between the bolster and the axle into contact.

**CARTRIDGE-LOADING MACHINE.**—Chas. W. Wacott, Murphy's, Cal. No. 347,455. Dated Aug. 17, 1886. In this machine there is a rotating cylinder, having connected with its inner surface a number of radially arranged adjustable charges, one set being for the powder and another for the shot. This cylinder is fitted within a stationary ring or rim having openings with which the necks of the powder and shot containing hoppers above, communicate. As the inner cylinder rotates its charges are brought into communication with these openings, whereby they receive their supply which they discharge below into a tube, under which are placed the shells to be loaded. A separate tube contains the wads which, by proper mechanism, are delivered to the shell as required, and are rammed home by a plunger. There is also a pin standard and lever for removing and replacing the caps, and the whole machine is so constructed that it will load cartridges of all descriptions without the use of expensive or additional parts or modifications.

**VERTICAL SHAFT-BEARING.**—Isaac P. Lambing, Lone, Cal. No. 347,431. Dated Aug. 17, 1886. The object of this invention is to relieve the step or bearing of vertical shafts from weight. These shafts, in almost every instance, wear in the step, in which they are mounted, and when they are employed to run centrifugal pumps, flour mills, and for other heavy or rapid work, it is almost impossible to prevent them from thus wearing. This invention accomplishes the object by relieving the step of the weight of the shaft, which is effected by means of two horizontal shafts, the

ends of which carry wheels or rollers which come up very close on each side of the vertical shaft. Upon the shaft is secured a collar or flange, having a steel disk on its wearing face, which rests upon the rollers upon the horizontal shafts. In adjusting the bearing, the vertical shaft is raised slightly from its step, and its collar is dropped down until it rests upon the tops of the wheels or rollers, when it is firmly secured and sustains the whole of the weight of the shaft. When the shaft is set in motion, the collar travels upon the tops of the wheels or rollers, which revolve very slowly and take all the weight off the step at the lower end of the shaft. Means are also provided for automatically lubricating the parts, and in this operation but a small quantity of oil will serve to lubricate the device for a long time.

**BATH APPARATUS.**—William F. Lambert, S. F. No. 347,430. Dated Aug. 17, 1886. This device may be used as a vapor bath or shower bath, or as a washing apparatus. A cylinder having a piston moving therein is employed, with a surrounding basin or tub to receive the water, and pipes connecting with the cylinder and carrying spray or other suitable nozzles in convenient proximity to the operator. There is also a platform mounted upon the piston rod, a brake by which the piston may be held, and means for raising the piston, for releasing the brakes so as to allow the piston to descend at will, a vapor generator and pipes connected with or surrounding the platform. The piston is raised by turning the platform, and when the cylinder is filled the operator places himself upon the platform and is covered or surrounded by a vapor-tight cloak fitting closely around the neck. The vapor or steam generated passes through a connecting pipe or hose in a circular perforated pipe around the platform and envelopes the body, making a very perfect and cheap vapor bath. After the vapor bath the cloak may be thrown off and the brake mechanism released, so that the piston descends, thereby forcing the water from the cylinder out through the discharge nozzles or sprays upon the operator. The apparatus takes up very little space, may be constructed at a low price, requires no physical exertion to work it, and can be made ready for use in a very short time.

## New Manganese Mines.

The New York Times says: James B. White & Co., of this city, have completed the purchase of a 5000-acre tract of manganese ore land in Virginia. This purchase will enable these gentlemen to supply the home market with sufficient manganese ore to shut out the greater part of the spiegel and fine manganese imported from England. They will commence the development of the tract at once, and inside of a few months will have a new town built and about a thousand men at work, who will be getting an output of 500 to 800 tons of ore per day. The new purchase lies 20 miles from Waynesburg, and is within three miles of the Shenandoah Valley Railroad. Messrs. White & Co. will at once commence the construction of a branch road, and it will be pushed to completion as rapidly as possible. Men are at work now developing the tract and they find that ore is reached at a depth of about 80 feet. It lies in large bodies, or pockets, and it does not run in veins like coal.

As soon as the exact lay of the ore is determined on, the work of mining will be commenced. The tract lies up in the mountain, where there are no dwellings, and contracts for the building of a town will be let. Two hundred houses will be erected at once, and in the meantime the shafts will be sunk and all made ready for the beginning of work in the mines. The company expects within eight months to be able to ship at least 500 tons of the ore per day. The deposit is so large and the ore so easily mined that they expect to have no trouble in doing this. The present demand for manganese and spiegel, which contains 40 per cent of manganese, is about 20,000 tons a month. With the exception of the Cambria Iron Works and the mills of the Carnegies, all these metals are brought from England, and the manufacturers have always labored under a disadvantage. By their purchases these two firms have been given a great advantage over all other manufacturers, and have consequently secured a great lead. The less favored mills have tried to secure mines of their own, but so far have failed. The Whites will be able to place in the market at least 10,000 tons per month of manganese ore from their new purchase. This will shut out half the English imports, and with a little more time they may be able to double their capacity.

A GENTLEMAN interested in copper, just from the East, while there talked with some of the leaders in the trade, advising the formation of a pool, to control the price at such a figure as would hold copper at a point allowing a fair margin to the largest investors, but forbidding the dozens of small mine-owners from entering the field of production again. He looks to see this done and believes it the only mode of checking the wreck of copper prices.

WHEN a party abandons a mining claim he has the undoubted right to remove from said claim any machinery or buildings which he may have placed thereon, or any ore which he may have extracted from such mine.

## Concentration of Ores.

The present season, says the Denver Tribune-Republican, is prolific in the establishment of new concentration mills. There is scarcely an important camp where is not promised one or more of them. The process man is getting in his work in good shape, and the talkative humbug, who professes to be a "practical mill man," is not at present out of a job. It is in milling as it is in mining; let some poor prospector make a big strike and leap at once from poverty to wealth, and prospecting receives a great impetus, and grub stakes become plenty. So let some one mine obtain a concentration mill and find it a source of great profit, and immediately every man in the country must have a concentrator. If "Mulberry Sellers" can make big money out of a concentrator, why can't the "man in the moon," thinks the owner of the latter impecunious claim. The process professor and practical mill man say there is no earthly reason why a lot of money should not be made, and urge the construction of a mill. The caper for the process man gets in his word when it will do the most good, and the salesman who gets a commission from machinery manufacturers adds his influence. An expert is selected, an examination is made, a favorable report is returned, the money is subscribed, the mill goes up with a flourish of trumpets, the local papers prophesy great success, and things boom, and everybody is happy so long as the expenditure of money is continued. The mine-owners are copped into the employment of some lunkhead or scoundrel as an expert, and the whole thing is little less than a bunko game. The mill fails, debts, sheriff, sale, ruin; these are the words that tell the story, which apparently is to be continued without end.

Among all the problems concerning the treatment of ore, there are none surrounded with more difficulties than concentration. It is considered the simplest, but is the most difficult. There is, comparatively, little ore which is well suited for concentration by mill processes, and judging from past results there are few experts who are competent to tell whether or not any particular ore is suited. The errors that have been made in that branch of ore treatment would be laughable were they not such a lamentable evidence of human credulity and ignorance. We have known mills to be erected for the concentration of ores whose value was in the light gangue, and the concentrates produced were worth less than the ore before treatment. We have seen mills erected to work on ores whose gangue was baryta and whose value was a sulphuret of silver or gray copper, and men who reveled in the title of metallurgist said the scheme was practicable. We have known of one company in Southern Colorado expending over a half of a million dollars trying to concentrate a galena ore, when the pure galena was worth only \$40 per ton, and when they succeeded they wondered why they could not get a high-grade concentrate.

It is altogether practicable and not costly to determine whether an ore can be concentrated profitably by any milling method, and when that fact is ascertained there is an abundance of opportunities for determining what particular method, if any, is best suited to the ore, without going to the expense of erecting a costly mill. An ordinary amount of care and study of the subject will prevent any man from making mistakes in the erection of a concentration mill; that care and study, however, must be rightly directed, and "there is the rub."

## Diving for Gold.

In the U. S. of Colombia, gold is found in many of the streams; but the principal and never-ending source of stream gold, or "oro corrido," is the River Cauca. Here is a deposit of gravel and boulders 20 feet or more in depth, containing gold from fine dust up to the size of a pigeon's egg. The superficial gold, or gold of the "playa," as it is called, varies remarkably in its composition from the gold which is found on the bedrock. We give here a few analyses of Cauca gold: No. 1: From the "playa" (dust) gold, 67.06 per cent; silver, 32.94. No. 2: Ten feet below the surface of river bank (grains), specific gravity 13.18, gold, 75.97; silver, 24.03. No. 3: From bedrock (grains), gold, 78.70; silver, 21.30. No. 4: From bedrock a lump weighing 307 grains, specific gravity 13.35, gold, 90.40; silver, 9.60. During the dry season probably \$5000 per month are taken from the Cauca in this locality by the "natives" alone, as there is no company working this river. The "native" system of working is certainly primitive. A negro having tied a stone to his neck (so as to be readily disengaged), and a rope to his body, which is held by a companion (generally a woman), throws himself into the stream as far as is consistent with safety, and sinks, batea in hand, to the bottom. Having scraped up a batea full of gravel from the bottom (which, by the way, is no easy matter, on account of the immense boulders), he disengages himself from the stone and is brought to land, batea and all, by his companion. When they have accumulated a small heap of gravel it is washed up in the batea. The other method of working is to sink a small shaft on the river bank quite down to the bedrock, and then tunnel in any direction which the big boulders will allow them to, but principally away from the river, always keeping close to the bedrock. An intelligent German, named

Wolff, has constructed a kind of dredging machine for picking up gravel and boulders, to work a few miles farther down the river. The gold from the River Opirama, a tributary of the Cauca, contains per cent: gold, 83.60; silver, 16.40. At present, however, the most important source of gold in the Marmato district is in the mines, which have been worked for more than a century and still show no signs of being exhausted, only the upper part of the mountain having been worked. There is a great deal of variety in the composition of the gold from the different mines.

## Figures for the Thoughtful.

Census statistics show that the people of this country, during the 250 years of their existence as colonies, Territories and States, up to 1860, accumulated and held property to the aggregate value of only \$14,000,000,000, including all landed and personal property. During the 20 years next succeeding the commencement of the war of rebellion our people had paid out, in war, national, State and municipal expenses, a greater amount than all they had accumulated up to the commencement of the war; and yet, with all that immensity of outlay in taxes, customs, etc., they had nevertheless, during the same term of 20 years, accumulated, as shown by the census of 1880, the enormous sum of \$22,000,000,000, or about 70 per cent more than the total accumulation of the previous 250 years!

We now come to another class of figures which present an equal subject for thoughtful consideration. Of the 20,000,000 people who do something—some work or engaged in gainful pursuits—18,000,000, or nine-tenths, of these earn on the average not much more than \$300 a year, which is necessarily consumed in means of subsistence, while substantially all the savings go to the other one-tenth.

Is it any wonder that in view of these later figures we are just now in the midst of a general industrial paralysis? We have a million of workmen idle for want of work to do, and capital in still greater proportion than unemployed labor lies dead or unproductive, and that, too, while our hills and mountains are full of mineral wealth, while millions of acres of productive lands wait for the plow, and homes for homeless millions are to be had for the taking.

It is estimated that the 20,000,000 of our wage-earners make an average annual saving of about \$75 each. Whatever number of persons save double the average yearly saving, or \$150, an equal number save nothing. For as many as acquired \$250, or three times the average annual saving, a like number not only saved nothing, but fell the average yearly saving of \$75 short of the necessities of comfortable existence. Facts plain as these show how dangerously near the great mass of men always are to want and suffering.

**WHY DON'T YOU WORK YOUR MINES?**—The summer is rapidly passing, and while there have been a few assessments worked, there has been but very little ore shipped. The cars are here ready to haul the ore, the smelters in Gunnison are ready to buy your ore, so what more of an inducement do you want to work your mining claim, if you have got one? If your claim has any semblance of ore in sight, take it out, and by that means gradually develop your prospect into a mine. Work is what is wanted to develop the country, and unless you get to work and develop your mine, the country will never be what it ought to be. The truth of the matter is, that there are some claims owned here by prospectors who are too poor to do much work only in a small way. This class of claim-owners need assistance of capital to give them a start. Any one who has capital to invest can come in here and secure interests in good prospects at a very reasonable rate, and there is no better business in the world than a producing mine. There is another class of Jim Crow companies who have exhausted all their means in getting a bunch of claims patented, some of which are worthless, then they have gone to their eastern homes to wait for their claims to grow into mines. Such is the condition of affairs in the Elk mountains to-day. No mining country in the whole United States has had as good an opportunity to prosper as has the Elk mountain country. First, we had our boom, then the railroad was built into the country, facilitating transportation, and now we have a market for our ore in Gunnison. All that is needed is work in the mines to produce the ore, and until such time when the work will be done we cannot expect the country to be redeemed from its present lethargic state.—*Elk Mt. (Col.) Pilot.*

**PLAIN TALK TO ROYALTY.**—Just after the recent terrible riots at Brussels, in Belgium, the King sent for the leader of the Liberals and asked substantially: "What is the matter?" "Why these riots?" and "What is proposed to be accomplished by them?" The Liberal leader replied in about these words: "The government is heedless of the wants and wishes of the people. They starve in thousands. Women destroy their babes for want of bread. And you are more intent on preserving the vested rights of property than the lives of the poor. It must be changed, or the people will change it. The Socialists will aggravate every riot into a revolution, and the people will back them. Vested rights are nothing to the lives and liberties of the people."

## Passing Events.

The current week has come and gone, bringing with it nothing notable or calling for special comment in the mining world. Judging by reports received from all parts of the coast, the great industry moves on steadily and surely, escaping the fluctuations and uncertainties that more or less attend every other branch of business. The advance made of late in the price of lead is well maintained, affording much relief to the producers of that metal. The prices of silver and copper have evidently reached their lowest point, some improvement beginning to manifest itself in the market for both. Commercial and financial circles, not less than the industrial and mining interests, alarmed at the steadily declining value of silver, are concerned now to find means for arresting its further depression. That such means will be discovered and availed of, where such vast interests are at stake, we may well believe. That this metal is not to be ostracized or further demonetized is now evident. Some improvement in the business of its production may therefore be counted upon.

For the first time since the conflict between the farmers and the miners began, hydraulic operations in the central mining counties of this State have entirely ceased. At least this may be inferred, seeing the waters of the Sacramento and its tributaries run clear, as in

primeval days. Now are the valley editors, including Swinley's boarders, "content and happy." The streams in the interior having fallen to their lowest stage, the river-bed miners are in the midst of their harvest, which in most localities will be somewhat restricted, there being rather more water in the rivers than usual at this season of the year. Owing to this condition of things, the Big Bend tunnel, on Feather river, has not been able to take in the whole of that stream, as was expected. This, though a serious disappointment to the company, preventing the working of the river bed this season, has not discouraged them. Already the work of so enlarging this tunnel, that it will answer the purpose intended, has been commenced and will be hurried to completion.

The appalling catastrophes that have befallen Charleston, Savannah and other Eastern cities through earthquake disturbances become the one absorbing topic of conversation and thought toward the end of the week, our people refusing to congratulate themselves that these calamities have been shifted from this land of traditional earthquakes to countries further East. They feel the afflictions that have visited our brethren beyond the Mississippi the same as if they had befallen those inhabiting this slope of the continent. The occurrence of this disaster will have the effect to dispel the sense of security against phenomena of this kind, which has heretofore obtained in this part of the world. Besides the lightning and the cyclone, we have to recognize now this new agent of destruction and element of danger. May this agent never again prove more destructive in these United States than it has thus far done here in California.

## A Caller from the Cœur d'Alene.

Col. R. A. Pomeroy, of Murray, Idaho, Supt. of the Golden King Mining Co., has been making a trip to San Francisco (not for the purpose of selling any property nor booming any mine, but on private business), and we had the pleasure of a call from him early this week. Col. Pomeroy is an old Colorado miner, having been for years charged with the direction of some of the largest mining operations in that State, and represented Clear Creek and Grand counties officially at the New Orleans Exposition.

As early as 1884 he was sent to the Cœur d'Alene, to explore for capitalists, found the country practicable, as a mining region, and reported accordingly. In consequence of his visit, several hundred thousand dollars were invested in the district, and wherever any prospects have been worked the results have been uniformly good, in fact, the most favorable he has ever seen in so new a country. There are gold quartz, argenteiferous galena, gray copper, carbonates, etc. The Colonel has examined the quartz of Tuolumne, Calaveras, Amador and Plumas counties, Cal., and regards it as identical with that of the Cœur d'Alene. The mines thus far discovered are within a radius of about 30 miles from Murray.

Murray is the shire-town of Shoshone county, and has 500 or 600 inhabitants. It is already provided with water-works and two fire companies, as well as a bank, of which Charles Dahler, of Helena, is president, and Warren Hussey, formerly of San Francisco, cashier. There are two papers published there, namely, the Cœur d'Alene Record, tri-weekly, and the Sun, daily and weekly—the latter by Adam Aulbach, an old Californian. Beside a number of arastras, a stamp-mill is now at work and two more are in process of construction. Murray is connected by a good wagon and stage road with Thompson Falls, M. T., 28 miles on the North Pacific R. R.

At Wardner, on the south fork of the Cœur d'Alene, about 20 miles from Murray, as Col. Pomeroy further informed us, a smelter and concentrator are in operation. Here may be seen some of the largest silver-lead mines in the United States. The population is about the same as at the county-seat. The News is printed weekly. This district—the Yreka—is being rapidly developed with excellent results, showing permanent veins. The placer mines on Prichard and Beaver creeks and their tributaries have also done well this season. A great deal of Colorado, Montana and Eastern capital, especially from Kentucky, is here invested; but California, as yet, has secured but little foothold. The interests here are not inflated and

need no "booming," but stand squarely upon their merits. Wardner looks confidently for completed railway connection, inside 60 days, with the steamers which ply from the old Mission to the military post, 11 miles from the N. P. R. R. A fine line of stages runs from the post of Spokane Falls.

Lesser towns of the region are Littlefield, Eagle, Myrtle, Delta, Kingston, Milo, Placer Center and Mullan City.

There are two practical routes to the Cœur d'Alene, the Lake route being the better for reaching Wardner and the Thompson Falls for Murray.

## Machine Shop and Foundry Notes.

## Dow Steam Pump Works.

These works are running on a full force of men. The large compound steam-pump for the new Crocker building, on Bush street, has been completed and put in place in advance of time. A contract has just been completed with the Spring Hill Water Company of Seattle, W. T., for a new stationary fire-pump; steam cylinder 24x24 inches and water end 12x24 inches. This will be the largest special steam fire-pump on the coast. The capacity will be 1500 gallons per minute, equal to eight one and one-eighth streams, having 170 pounds pressure instead of 120 pounds as in San Francisco. This will give Seattle a generous supply for domestic and fire purposes.

The present supply is from Lake Washington, eight miles east of the city. The pumping at present is done by a compound Dow pumping plant; steam end 18 and 36 inches by 36 inches stroke and water end 16 and 36 inches stroke. These have been working since June, 1884, without repairs, raising water over the divide 415 feet and pumping two and a half million gallons in 24 hours. This duty speaks volumes for their efficiency and construction.

It is contemplated to make a large reservoir on top of the hill to hold some 10,000,000 gallons of water, when the city will have its supply by gravity instead of pressure. To accomplish this the company will probably duplicate the present compound pumping plant. It is also in contemplation to have extra cotton hose to stand this heavy pressure. These improvements are being carried out under the direction of H. H. McWilliams, Esq., the consulting engineer of the company.

The Dow Works are also building a combined air and feed pump for the steam tug *Elta White*, owned by Welch & Co., of Burrard's inlet.

The same works are also constructing a large ice-machine plant for the Standard Ice Company, of Los Gatos, Santa Clara county, Cal. This new company, under the superintendence of J. C. Kitton, Esq., formerly in charge of the Arctic Ice Company, of this city, have purchased the old Los Gatos flouring-mill and water power of 200 feet fall, and have contracted with the Dow Works for a preliminary plant equal to 10 tons per day. The water power being already utilized by a wheel, the building—a valuable stone structure—is all ready for business. It is only requisite to couple on the vacuum pumps and other machinery to have the motive power at a nominal cost. This enterprise is backed by several of the substantial citizens of San Jose, and it is the intention to supply that section and San Francisco.

## The Fulton Foundry.

Hinckley, Spiers & Hayes have a full line of important work in hand. The contract with the United States Government for the construction of a large bucket dredger is now nearly complete. This will be one of the most complete of its class.

They also have the contract to construct and completely equip the new 40-stamp Kennedy quartz mill; building, foundations and machinery ready to operate. This mine, in Amador county, under the charge of Mr. Thomas, of Oakland, has a promising future before it.

Simpson Bros., of Coos Bay, have just ordered a new 16 by 24-inch saw-mill engine for their mill at that point.

A novelty in steam engineering is a steam traction engine for hauling loads in the lumber region, or other uses, the invention of W. L. Leland, and will be ready for trial in a few days. The engines—two—are eight inches by twelve inches stroke, are calculated for hand and efficient work; the machine will weigh some 15,000 pounds.

The variety of steam plant constructed at

these works is notable: dredgers, quartz mills, saw-mill engines, traction engines—a novelty on this coast—besides marine engines of the largest and most powerful tugs and ferry steamers. The most important job in hand is the machinery for a fine large new ferry-boat for the South Pacific Coast R. R. Co.—narrow gauge—which, when completed, will enable them to run 15 minute trips, as now contemplated. The boat will be somewhat larger than the *Bay City*. The engine will be similar in design to those of the other boats and will be 52 inches diameter and 12-foot stroke. They are also constructing hoisting works for Grayson, of Fresno, also for Bullard, of Amador.

## Pacific Iron Works.

Work has been resumed at these works, and contracts are now in hand for a 10-stamp quartz mill complete, with Duncan concentrators, for Cœur d'Alene, Idaho. Orders are also in hand for water-jacket smelting furnaces for mines in Mexico and other points. These water-jacket furnaces seem to have met with great favor among mine-owners, where their peculiar features can be made available. These works are also the manufacturers of the new Frisbee-Lucop mill, a centrifugal roller mill of very powerful action.

## The Golden Gate and Miners' Foundry

Are running full force on a variety of work from dredgers to quartz mills, a novelty in the last line being the Beauregard Roller Mill, which has proved an unqualified success in actual practice. As quartz machinery has always been the "strong suit" of these works, it is not strange that they are usually full of it, although a recent departure in the machinery of the stern-wheel river steamer, *A. C. Freese*, constructed by this concern, would seem to indicate that river steamboat machinery was also "in line," as it has been remarkably successful.

## I. H. Small.

Who was burned out in the heavy Brannan and Fifth streets fire, has already made arrangements to have his work carried on at the Globe Works until he can complete other arrangements for manufacturing his improved wood-working machinery. A compound marine engine, constructed for A. M. Simpson's new tug for use on the Columbia river, by Mr. Small, has proven a fine success, although a new departure for him.

## The Risdon Iron Works

Have a varied line of work in hand, a leading feature being the "Hein" boiler, which has met with great success as a flour-mill boiler, and in all situations where a steady and economical power is required. The "Risdon" has won a high reputation on the Pacific Coast and the Islands, as builders of heavy and complicated mining and pumping plant, some of the most important of the Comstock work being from their shops. Sugar mills and heavy marine work have also been a leading feature in recent constructions. The large and heavy machinery of these works enable them to execute the very heaviest contracts.

## The Union Iron Works.

These works are again assuming their wonted air of completeness, as they are now working 487 hands. A very beautiful steel steam harbor-tender has just been completed to the order of the Government of the United States. She is somewhat larger than the *General McPherson*, which she will succeed. She is a very fast and handsome boat. Marine engineering is the leading feature of these works, and they have far superior facilities to any one on the coast, and second to none in the United States, for the construction and engineering of iron, steel or wooden steamships, tugs, etc., as they are located on the water-front and have large and heavy plant for the very largest and most important constructions. An effort has been made to have one of the new "cruisers" recently authorized by the Government of the United States built at these works, and we believe with a fair chance of success. If this new cruiser is constructed here we can be sure that she will be as well and promptly built as at any yard in the country.

## Joseph Wagner.

The specialty of this concern is flour mills, and in their line they have no competition of moment on this coast. They report that they are fairly busy in new mills, remodeling, etc., Samm's mill, at Oakland, being remodeled to run 200 barrels per day.

A New Wave Motor.

Numerous attempts have been made to utilize the now wasted force of sea waves. The ocean, bays, and harbor represent limitless power if it could only be applied to machinery for various mechanical purposes. An inventor in this city, Terrence Duffy, has devised an appliance by which he hopes to compress air by means of the waves, for transmission ashore to machinery for any industry in a city or town; and, by the addition of the necessary apparatus this compressed air may be employed to generate electricity for illumination or power. The buoy, shown in one of the engravings accompanying this article, is anchored at a convenient distance from shore, and the compressed air is conducted in a flexible pipe to the reservoir or station ashore, whence it may be conveyed in pipes to the machinery.

Fig. 1 shows a vertical section of a metallic buoy, *A*, made preferably in spherical form, and of any required dimensions. The buoy is provided with a conical standard, *C*, which is bolted to the bottom of the buoy as shown in the drawing. This standard is an important feature of the wave motor, as it supports the ballasted basin *B*, on a level, maintaining it always on the plane of the horizon. To accomplish this purpose the standard is provided with a ball-shaped head, *f*, on which the semi-spherical cap, *b*, of the basin fits. As the standard is bolted to the buoy and forms part of it, it will be seen that the buoy, reciprocating the motion of the waves, oscillates and swings on the ball-head in the cap of the basin. In order to fend off the swing of the buoy against the lower ends of the basin, heavy rubber bumpers, *a*, are secured to the lower outer sides of the standard. These bumpers prevent shocks and induce steadiness. The cap, *b*, is bolted to the annular top of the basin, and is provided with an oil-cup, *c*, for lubricating both cap and ball-head.

The basin, *B*, is ballasted, as shown in the drawing, for the purpose of giving the required pressure to the air-pumps, which is at the rate

apparatus and fixtures; on the lower deck, *d*, is the annular air-chamber, *F*, from which air-pipes extend; and on the upper deck, *e*, are ar-

whistle *U*, electric light *V*, and bell *W*. Fig. 2 is a plan of the tower *O*, and water reservoir *R*, in four compartments. We omit [Fig. 2,

WAVE MOTOR FOR SERVICE AS RELIEF OR LIGHT STATION.

the brake fits loosely on the shoe, and guides the basin and prevents it from swinging; and when it is necessary to hold the basin rigid to the buoy, the brake is screwed inward to impinge on the shoe.

Encircling the buoy above the water-line is a great reservoir, *E*, for storing the compressed air received from the air-chamber, *F*. The reservoir is divided by a number of partitions, each of which is provided with an automatic valve for the purpose of preventing the air from returning and to force it forward to the point of delivery. It is provided also with the necessary escape-valves. In addition to its purpose for storing compressed air, the reservoir serves to impart steadiness to the buoy.

The air chamber, *F*, which has been described as arranged on the lower deck of the basin, receives compressed air from the air-pumps through the pipe *G*, and delivers it to the reservoir through the pipe *K*, which extends upward to the reservoir in the manner shown in Fig. 1. The air-pipe, *K*, is provided with a stop-cock, *v*, to regulate the passage of compressed air, and in order to secure it from injury or breaking, it is provided with a flexible tube, *L*, which reciprocates the motions of the buoy. Compressed air is conveyed from the chamber, *F*, to the engine by a pipe, *H*, and air escapes from the engine by pipes, *w*. The buoy is supplied with fresh air through pipes, *T*, as well as through portholes in the upper segments and through the tower, *O*.

The air-pumps, *D*, are of peculiar construction and arrangement, and are secured in such a manner as to reduce the probability of an accident to them to the minimum. Each pump is bolted to the side of the basin, by a plate, *r*, which is attached to the pump-barrel or forms part of it, as shown in Fig. 6; and it is secured to the shell of the buoy, on the ribs of which there are lugs, *p*, by the piston-rod, *o*, which is held loosely on a bolt which passes through and is secured to the lugs. From the center upward the pump-barrel is graduated in sections and each section is provided with a receding valve. Fig. 5 is a vertical section

ranged the engine, *I*, and dynamo, *J*, and cabins and store-rooms, *M*. A stairway leads to a platform, *N*, placed over the basin cap,

which only shows a general plan. For the purpose of guiding the ballasted poised basin, and preventing it from swinging

VERTICAL SECTION SHOWING INTERNAL ARRANGMENT OF WAVE MOTOR.

ARRANGEMENT OF AIR PUMPS, VALVES, ETC.

of 50 pounds to the square inch for each pump. In the center of the basin there is a conical space for the standard. The air-pumps, *D*, one of which is shown in Fig. 1, are bolted by a plate, *r*, to the sides of the basin, and are attached to the buoy in a manner which will be described hereafter. The basin is provided with decks, on which are arranged necessary

from which the tower is reached by a spiral stairway.

Fig. 1 is a vertical section through the buoy and framework showing the arrangement of the ballasted basin *B*, one of the air-pumps *D*, the air reservoir *E*, the air-chamber *F*, the engine *I*, and dynamo *J*, the guiding and braking device *b*<sup>1</sup>, *b*<sup>2</sup>, and the lower *O*, water reservoir *R*,

round with the buoy, and also to hold it rigid to the buoy and to stop the operation of the air-pumps while making repairs or for other cause, there is provided a guiding and braking device, as shown in Fig. 1. A brake, *b*<sup>1</sup>, having a jawed recess in its end, is secured to the top of the basin on its four sides; the shoes, *b*<sup>2</sup>, are attached to the shell of the buoy. The recess in

of one of the air-pumps, *D*, and part of an air-pipe, *G*, showing the check-valve, *g*, and receding valves, *g*<sup>1</sup>, *g*<sup>2</sup>, *g*<sup>3</sup>, *g*<sup>4</sup>, the guide-bars, *k*, and the universal joint, *n*, connecting-piston, *m*, and piston-rod, *o*. Fig. 6 is an elevation of one of the air-pumps, showing plate, *r*, for attaching it to the  
(Concluded on page 160.)

## MECHANICAL PROGRESS.

## Cold Hammering of Iron.

It either is or ought to be known to all practical men concerned in the working of wrought iron, that if a piece of the very best and toughest iron is hammered in the process of forging until it ceases to be red hot, the effect of such cold hammering, as I may term it, is to cause the iron to become so brittle that it will in many cases break across in the process; or if it does not at that time, this process of cold hammering has so removed and destroyed its tenacity as to render it capable of being broken with the slightest blow. What renders the knowledge of the effects of such a process the more important is that in most cases we shall find that, in order to give the pieces of forged work the requisite finish and fine surface as they come from the hands of our workmen in that department, this very cold hammering and swaging, as it is termed, is required, the more so as it is by such a process that iron forgings are so finished from the hammer as to require the least possible labor after; and as every good workman in that department is anxious to turn his work out of hand with the very best surface on it, which this cold hammering enables him to do, it is not a very easy matter, and not at all desirable, to require them to discontinue the practice, which many have endeavored to do from want of a full knowledge of the subject.

There is nothing inherently wrong in this practice of cold hammering—far otherwise; the evil rests with the applying such a cold hammered piece of forge work to its purpose without having been passed through the curative process, which is simply this, namely, to heat the piece of forged work in question to a dull red heat, and lay it down to cool at its leisure. By subjecting wrought iron to the most violent hammering or compression at a low temperature, and then submitting the iron work so treated to the simple process of heating red hot and slow cooling, we enhance its tenacity or shock-sustaining qualities at least 20 times.—*J. Nasmyth, in the Architect.*

## Iron That Will Not Rust.

The liability of iron to rust is a great drawback to its use for many purposes, and the practical value of a process which will protect it, at a slight expense, is self-evident. This is accomplished by the Bower-Barff process. That the process is successful in accomplishing this object seems no longer a matter of doubt, and at less cost than galvanizing or tinning. The color on cast and wrought iron is a bluish-gray, which to some may be objectionable; but, as the coating takes paint far better than untreated iron, this objection is easily overcome, and with the assurance that the paint will remain and not soon be thrown off as it is generally. For polished work the color is a lustrous blue-black, adding greatly to the beauty of the article treated. This process seems peculiarly well adapted for gas and water pipes. Any one who has had occasion to use water which has passed through a new iron pipe, or one that has not been used for some time, knows how full of rust it is, and that only after months of constant use does it become clear again. With pipe coated with the magnetic oxide by the Bower-Barff process, no trouble of the kind can occur. The water runs pure from the first day, and if for any reason the pipes are emptied, and left so, there is no danger of their becoming coated with rust. Another important fact is that the water coming through one of these rustless pipes is just as pure as when it entered, for the water can dissolve none of the coating of oxide, as it always does with lead or galvanized pipes. It is a well-known fact that water running through lead pipes is very apt to contain lead in solution; and the continued use of such water causes lead-poisoning, for, although the amount (of lead) dissolved may be very small, still it accumulates in the system, and finally causes sickness and disease.—*Popular Science Monthly.*

**ACTION OF SUGAR ON IRON.**—MM. Klein and A. Berg have been studying the action of sugars on the corrosion of boilers, and find that sugar in water has an acid reaction on iron, which dissolves it, with a disengagement of hydrogen. The quantity of iron dissolved increases with the proportion of sugar in the water. The salt of iron formed is the acetate. A neutral decoction of malt also corrodes iron with the disengagement of hydrogen; but glycerine and mannite are without action on the metal. These results are worthy of note in sugar refineries and places where sugar sometimes finds its way into the boilers by means of the water supplied. The experimenters in question also find that zinc is strongly attacked by sugar; copper, tin, lead, and aluminium are not attacked.

**MACHINERY AND ITS POSSIBILITIES.**—Those who entertain the opinion that the possibilities of labor-saving machinery are nearly exhausted, and that the whole field of art industry in which it may be advantageously employed has been already covered by inventive genius, are greatly mistaken. That the achievements of human ingenuity have been wonderful, goes without saying, and there are reasons to believe that future triumphs in this direction will be even greater and more fruitful. We are forced to this conclusion by reason and analogy. Who would

have believed, only a few years ago, that the difficult and complicated processes which are now every day being wrought out by machinery in various branches of manufacture would have been possible? Thus it is that the problems unsolved by one generation become accomplished facts by another. Who shall say that what now seems impossible and improbable may not be successfully attained by those who will come after us? In the hands of the modern scientific inventor matter becomes almost miraculously endowed with life and intelligence, and with great accuracy performs those functions which the most skilled manual labor executes but slowly and imperfectly.—*Manufacturer and Builder.*

## Relative Strength of Wet and Dry Timber.

In reply to a statement by the *American Miller*, that "wet timber is not as strong as dry; in some cases it has not half the strength of dry," a correspondent of that paper writes as follows: "In September, 1876, the Lanesboro Mills, Lanesboro, Minn., were burned, and that fall we rebuilt them, and began making flour the next March. We used sawed pine (taken out of the Mississippi river) for joists, 3 by 12 inches, 12 feet long, and sized them, laying them on top of the girders, to get their full strength, and then used  $\frac{3}{4}$ -inch flooring. The joists were placed 12 inches from center to center, leaving nine inches between them. In the fall of 1877 we piled wheat on the floor 26 feet deep in the bins, and the joists, yet wet and green, only sagged a trifle, and carried the immense weight safely. Two years later the same joists were dry from the heat of our very large stove. We loaded the floor with 24 feet of wheat and six joists broke off nearly square in the middle, and others were cracked. In the first instance the bins held 360 tons of wheat while the joists under them were green; when the joists were dry 300 tons or less broke several of them. This shows that green pine is stronger than dry pine, as the wood becomes brash, or brittle, on drying, and is not as strong as when green. This is caused by the sap drying and leaving only solid matter in the capillary tubes, and they cannot move one on another, while if the timber is green the tubes are full of water, and can bend or move one on another. I know of but two kinds of wood that are stronger dry than green, and they are maple and white oak."

**BOILER-MAKING.**—In regard to boiler-making: "No matter what the quality of the material," says a practical man in the *Iron Trade Review*, "it can be, and often is, injured in the process of manufacture by unskilled workmen. This is especially the case when the inferior qualities are used, as excessive labor in manipulation strains the already weak material in an injurious manner. A stalwart, energetic calker can destroy the utility and safety of a boiler when poor material is used, by the vigor and number of his blows, and keenness of the edge of his tools. Even in first-class material this can be done; hence the necessity of intrusting this branch of the business to men of intelligence and experience. So with the drift-pin in the hands of the riveters; in poor material a fracture can be, and often is, produced with the grain of the material. Occasionally this is done across the grain; an exposure of the defect would also expose their ignorance and recklessness, resulting probably in their discharge; for this reason the use of tools to hide the defect is resorted to, and the matter (hidden from all eyes) may prove the initial cause of an appalling disaster."

**ANIMAL POWER VS. STEAM.**—Mr. A. Sanson, in an article in a recent number of the *Revue Scientifique*, states that from a comparison of animal and steam power, in France at least, the former is the cheaper motor. In the conversion of chemical to mechanical energy, 90 per cent is lost in the machine, against 68 in the animal. He finds that the steam horse power, contrary to what is generally believed, is often materially exceeded by the horse. The cost of traction on the Montparnasse-Bastille line of railway he found to be for each car, daily, 57 francs, while the same work done by the horse cost only 47 francs; and he believes that, for moderate powers, the conversion of chemical into mechanical energy is more economically effected through animals than through steam engines.

**PAPER DOORS.**—These cost about the same as wood, and are said to be much better because there is no shrinking, swelling, cracking or warping. The paper door is composed of two thick paper boards stamped and molded into panels and glazed together with glue and potash, and then rolled through heavy rollers. It is first covered with a water-proof coating and then with a fire-proof coating, and is painted and varnished and hung in the ordinary way.

**MAKING PIG IRON BY GAS.**—The experiment is now being tried in a Pittsburg mill of making pig iron by the use of natural gas. The result is awaited with intense interest by many, as it is claimed that if the experiment is successful it will decrease the cost of making pig iron at least one-half, thus of course affecting the iron trade enormously. It would also, it is claimed, virtually ruin the coke trade in the vicinity of Pittsburg.

## SCIENTIFIC PROGRESS.

## Antarctic Explorations.

Scientists and geographers everywhere will be grateful to learn that, after the lapse of nearly half a century, attention is once more being turned to systematic and scientific exploration in Antarctic polar regions. Associations of scientific men have been formed both in Great Britain and in Australia, to act jointly in furthering such an object.

The first meeting of the Australian Association was held at Melbourne, on the 8th of June last, which was attended by quite a number of the members of the Geographical Society and of the Royal Society. At this meeting much enthusiasm was manifested. On motion of Baron Von Mueller, Capt. Pascoe, F. R. G. S., was elected president. After full discussion resolutions were passed affirming:

First—"The desirability of further Antarctic exploration being undertaken at an early date, not only for the furtherance of the study of the geography of the south polar regions but also for extended investigations into climatology, terrestrial magnetism, geology and natural history, as well as with the view of obtaining further insight into the accessibility and the utilitarian resources of that part of the globe."

Second—"That a communication be addressed to the New Zealand Government soliciting information as to whether the Harbor department of that colony still continues to locate periodically supplies for any shipwrecked people on Macquarie island; and if so, whether on any occasion facilities may be obtained for conveying a meteorologic observer and attendant with the requisite means of shelter and the needful instruments to that island, and what special means will be required to fetch these people back to New Zealand after a lapse of some months."

A copy of these resolutions was directed to be transmitted to the Antarctic Association in Great Britain, expressing active sympathy in the enterprise and proffering aid to the same.

It appears from the further proceedings of the meeting that the honor of vivifying action in this direction, after a sleep of half a century, belongs to the Geographical Society of Melbourne, whose president, Baron Von Mueller, in the course of his opening address at the meeting of April 18, 1884, said:

"It is the extensive complex of the South Sea islands, which promise to yield some of the grandest results for geographic science. The south polar lands under Australian and Polynesian meridians come more readily within our reach than those of any other nation, if, as I trust, we consider ourselves as merely the furthest southern occupants of the great British Empire. \* \* \* Mount Erebus and Mount Terror, historic monuments of one of the most glorious and one of the saddest of grand geographic exploits, are not further from Hobart than that city is from Cape York, and from these wondrous mountains the distance to the geographic south pole does not exceed 725 nautical miles. Whether an Antarctic continent connects Graham's Land with Victoria Land we have no means to surmise, but what enormous strides will yet have to be made to penetrate and map the southern polar regions can be grasped by our mind when we recollect that the distance from Graham's Land to Victoria Land is as great as from the latter to North Queensland. But just as through successive naval explorations, extending over several centuries, and most keenly followed up during the present secular era, portion by portion of the northern Arctic regions were rendered known, so also will it only be by long continuity of efforts, by great skill, bravery and perseverance, and by watching for a combination of lucky chances, that extensive charts of the southern polar lands can be furnished—perhaps some time in the next century."

This address was at once published with the proceedings of the society and forwarded to the learned societies of Europe and America. In the month of August following, the subject was brought before the Royal Society and the British Associations, and an Antarctic Exploration Committee appointed, which included the names of Sir Joseph Hooker, Admiral Sir L. McOlin-tock, and Captain Sir George Nares, veterans in the work of exploration in the polar regions.

The impetus thus given to the movement for renewing Antarctic exploration was referred to in words of rejoicing in the erudite annual address by Baron von Mueller, on the 18th of January last, on which occasion he drew attention to the importance of establishing an outpost on Auckland or Macquarie island as a basis of operation. Looking at the interest with which this question is now viewed by the scientific world, the day is probably not far distant when the many problems associated with the Antarctic pole and its mysterious region will be satisfactorily solved.

**LONG-DISTANCE TELEPHONING** is slowly but surely coming into extensive use. The American Telephone and Telegraph Company of New York has recently been organized for the purpose of establishing direct telephonic communication between the large cities of the country. The first line has been constructed between New York and Philadelphia, the length of the route adopted being about 100 miles. Four years ago a similar attempt was made to connect New York and Boston, but the iron wire

strung between the two cities did not prove successful. The present company has employed hard-drawn copper wires, and now has 74 of them running the whole distance. The line is entirely aerial, except where waters of some width are crossed, in which case submarine cables are employed. Between the two cities there are six series of cables. The line will be open for business within a few weeks, and it is expected that it will prove a great convenience.

## Struck by a Meteor.

Among the thousands of meteors or "shooting stars" as they are now generally called, which daily pass into the earth's atmosphere, many more than is generally supposed no doubt reach the earth; but it is only the very largest that are seen to fall, or that are discovered after their fall. Of course, the numbers which the earth actually encounters in its orbit are as numerous by day as by night, but it is very seldom that one is seen in the light of day, although many, no doubt, fall every day. There are quite a number of well-authenticated instances where they have been known to encounter human beings in their descent.

A correspondent of the *London Times* alludes to what was most probably an instance of the kind which recently occurred in the city of London. The correspondent writes as follows: As a gentleman, a well-known public official, was passing from St. James Park into Pall Mall by the garden wall of Marlborough House, recently, at a quarter to five in the afternoon, he suddenly received on the right shoulder a violent blow, accompanied by a loud crackling noise, which caused him great pain, and to stumble forward as he walked. On recovering his footing, and turning round to see who had so unceremoniously struck him, he found that there was no one on the pavement but himself and the policeman on duty at the park end of it. On reaching home the shoulder was submitted to examination, but nothing was at first discovered to account for the pain in it. But in a little while the servant who had taken away the coat to brush brought it back to point out that over the right shoulder the nap was pressed down flat in a long, straight line, exactly as if a hot wire had been sharply drawn across the cloth. The accident is therefore explained as having been caused by the contact of a minute falling star or meteor. It is an unprecedented and most interesting occurrence, and deserves, I think, to be placed on public record.

## The Origin of Cyclones.

Dr. Werner Siemens, in a recent paper on the "Conservation of Energy in the Atmosphere," gives a very interesting theory as to the origin of cyclones. He states that the comparative vacuum formed at the center of the cyclone can produce suction only in the direction of the axis of the cyclone, so that it either raises water from the surface over which it rotates or draws down air from the higher regions of the atmosphere. The clear sky and quiet air often observable at the center of a cyclone bear evidence that there is a descending current of air. According to Dr. Siemens, a local cyclone is produced by an impulse of the superheated air, due to some local cause, given at the boundaries of an upper and lower tract of disturbance of the neutral equilibrium of an atmosphere at rest, which reaches the boundary of the upper cooled strata of air, which have a tendency to descend. An outer descending current is thus formed around the inner ascending one, the amount of air descending naturally equaling the amount ascending. If the disturbance of equilibrium embraces extended upper and lower strata of air, the descending masses would produce an increase of pressure in the neighborhood of the cyclone, gradually extending to the surface of the earth and upward into the highest regions of the air, imparting its force continually to new superheated masses of air. This air ascends with the inner and upward current, descends with the cool outside current, to again ascend, producing a circular motion. The course of the center of the cyclone is determined by the direction of the mean velocity of all the air masses forming the cyclone, and its duration is that of the disturbance of the neutral equilibrium of the atmosphere which produces and maintains it. The local ascending current, by carrying dust and particles with it, may also produce rain by condensing the aqueous vapor of the higher strata.

**AN ELECTRIC RAILWAY IN DENVER.**—According to the *Denver Journal of Commerce*, the Denver Electric Street Railway has been in successful operation for over a month. Prof. Short, the electrician, has been untiring in his efforts to place his pet project upon a sound basis, and he seems to have accomplished that end. The invention and all that pertains to the construction of the road and its equipment is distinctly of Denver production. Without doubt it is the most perfect system of electric railway operation in the world. The cars are under perfect control, and, it is said, can be moved at any speed up to 15 miles an hour. It is claimed that this is the second electric railway in the United States opened for regular passenger traffic. Contracts have been let for the immediate building of 15 miles of track in the city, and orders for new machinery and cars have been placed.

## ENGINEERING NOTES.

## The Panama Canal.

This great work has been killed again and again by reporters and engineers, but it always comes up again to plague its critics. A leading financial journal of the French capital itself recently put forth a severe criticism on the methods and present management of the enterprise, and set forth in an apparent clear and truthful manner the desperate strait in which the company found itself in its efforts to procure funds to relieve itself of its present burdens and carry on its work in the future. It was argued that from its very inception, through every stage of its progress, down to the present time, its management had been characterized by a degree of recklessness which almost staggers belief. It was held that the work already done is the simplest and easiest on the entire route, and that the deep cutting and damming of the Chagres was the real difficulty to be encountered, and could be accomplished only by an amount of expenditure which would be absolutely ruinous to the enterprise as a commercial success. That the results of the recent investigations have substantially confirmed all the allegations of bad engineering, unreliable estimates and the worst of management. That there is no guarantee, whatever, that the proposed new loan would be anywhere near the amount which would be required to finish the work.

The editor of the *Economiste Francais*—the name of the paper referred to—holds that private enterprise cannot hope to complete the colossal work. But aid will have to be sought from other powers—the United States in particular will have to be appealed to; that such governments should be called upon to join in a guarantee, and that when the work was completed they would be expected to pro rate in making up any deficiency. The editor winds up with the opinion that the annals of history nowhere furnish an example of a work of international importance undertaken with such an utterly inadequate comprehension of the difficulties involved, and that but comparatively little real practical work has been done.

## Per Contra.

We read in other journals that everything is serene, and that the promoters are quite as confident as ever that the work will go on to completion, and that it will prove a financial success; that at the late meeting of shareholders it was shown that the canal has been constructed from its eastern terminus to a distance of 10 miles, and 20 feet in depth; that when M. de Lesseps rose to read the general report on the position of the company he succeeded in dispelling any uneasiness that may have existed in the minds of the shareholders. M. de Lesseps confidently predicted that by the end of 1889 the canal would be finished, or would be at least so near its completion as to admit of vessels passing from one ocean to the other. Since the last general meeting three large contracts have been made, so that at present there does not remain a single section which private enterprise has not undertaken to excavate. It is not surprising that, after the confidence expressed by the chairman, all the resolutions were carried with unanimity. There can be no doubt now that the work will be completed, and that the prestige which the great French engineer enjoys will enable him to raise the capital still required. M. de Lesseps is as sure to connect the two largest oceans by a waterway as he has joined the Red sea and the Mediterranean. Such are the comments of journals friendly to Lesseps.

## American Interest in the Work.

A correspondent of the London *Times* expresses the belief that the work will eventually be practically abandoned, or turned over to some new syndicate; that this country will eventually take up the project. Should the expected collapse occur, our London cotemporary will find himself most woefully mistaken. The people of this country have no other interest in the work than to keep it away from the direct control of any European power, and to watch the opportunity to secure fat contracts on the work. It is our people who have dug out, for good pay, the short section of the canal that goes through soft ground, on the east side of the isthmus—the only part so far completed. Our people built the Panama Railroad, and sold it out to the French at an enormous profit. We have also built three lines of railway across our own domain, and expect soon to construct a great ship railway over the Isthmus of Tehuantepec. But we have no idea of undertaking such an unprofitable scheme as the Panama canal.

**TUNNEL BETWEEN SWEDEN AND DENMARK.**—Mr. Alexander Rothe, an engineer formerly engaged at the Panama canal works, has submitted to the Danish and Swedish Governments plans for a railway tunnel under the sound, between Copenhagen, in Denmark, and Malmo, in Sweden. The tunnel is to have a total length of seven and a half miles, two miles between Amager and the small island of Saltholm, and five and a half miles between Saltholm and Malmo. The ground to be worked is stated to much resemble that in the English channel between Dover and Calais, and to offer no difficulty in the execution of the work. The cost of construction is calculated at about £1,200,000.

## USEFUL INFORMATION.

## Cleaning Woolen Fabrics.

A German technical paper, which is likely to be good authority on such subjects, expresses its views on cleaning woollens as follows:

Opinions on the best methods of cleaning woollens are so infinitely different, and so various and contradictory are the statements of practical papers on this point, that it appears to me, says the editor, a remunerative and interesting task to examine the matter thoroughly. I tried the various degrees of heat, from the hottest to the coolest temperature, and I employed all the favorite cleaning materials one after the other—soap, borax, ammonia, benzine and mixtures of these articles. The results were so decided, and so plainly marked, that the following conclusions must be regarded as definitely established:

1. The liquid used for washing must be as hot as possible.

2. For the removal of greasy dirt, sweat, etc., borax is of so little value that its application would be mere waste. Soap lye alone is better, but the preference must be given to soap lye along with ammonia. This mixture works wonders by quickly dissolving dirt from particular parts of underclothing which are hard to cleanse. It raises and revives even bright colors, and is altogether excellent.

3. On the other hand, for cleaning white woolen goods, there is nothing which even approaches borax. Soap lye and borax, applied boiling hot, gives white woollens a looseness and a dazzling whiteness which they often do not possess when new.

4. If shrinking is to be entirely avoided, the drying must be accelerated by repeatedly pressing the woollens between soft cloths. In no case should woollens be let dry in the sun, as in this case they become dry and hard. They are best dried in a moderate current of air, and in cold weather in a warm place, not too near the stove.

For colored goods there should be prepared a lye of seven quarts of soft water and two ounces of the best soft soap, the quantities being, of course, modified according to judgment and the dirtiness of the articles. The soap is dissolved over the fire, and the lye, properly stirred up, is divided into two vessels, to one of which is added a teaspoonful of ammonia for each quart of lye. The woollens must be entered at a heat which the hand cannot bear, and the fabric must, consequently, be turned and pressed with smooth, wooden stirrers. They are then pressed out as far as possible, and transferred to the second lye, containing no ammonia, and which by this time has become so cool that the articles can be pressed by hand, but no twisting or wringing must take place. They are then pressed between three or four soft dry towels, till the latter no longer become wet.

For white woollens there is added, instead of ammonia, a teaspoonful of powdered borax to each quart of soap lye, and the operation is otherwise conducted exactly as above described. If the second lye is too soapy, it may be diluted with a little hot water.

After two or three lots of woollens have thus been washed, the lye must be heated again—the first lot being put aside to settle, the second being made first—with the addition of ammonia or borax, as the case may be, and fresh lye made for the second.

**WORKING IN TORTOISE SHELL.**—The *Scientific American* furnishes the following information in regard to working in tortoise shell, in its query column: 1. How can the scraps or shavings of the working of tortoise shell be utilized? A. We know of no means by which they can be used. 2. How are names put on tortoise shell with fine gold wire? A. Wire is heated and pressed in. 3. How are names printed placed in between the shell, and plainly legible from outside? A. The name is placed between thin plates of tortoise shell. 4. How can two pieces of shell be soldered together? I have seen new teeth put into a comb, and imperceptible; how is this done? A. Use a pair of pincers or tongs, constructed so as to reach four inches beyond the rivet; then have the tortoise shell filed clean to a lap joint, carefully observing that there is no grease about it; wet the joint with water, apply the pincers hot, following them with water, and the shell will be joined as if it were one piece. The heat must not be so great as to burn the shell, therefore try it first on a piece of white paper. 5. How to polish tortoise shell? A. Having scraped the work perfectly smooth and level, rub it with very fine sandpaper or Dutch rushes; repeat the rubbing with a bit of felt dipped in very finely powdered charcoal with water, and, lastly, with rottenstone or putty powder, and finish with a piece of soft wash leather, dampened with a little sweet oil; or still better, rub it with subnitrate of bismuth by the palm of the hand. 6. How can you soften tortoise shell, besides soaking in hot water? A. Use diluted sulphuric acid; also see Spens' "Workshop Receipts."

**UTILIZING SEAWEED.**—An English chemist has devised an entirely new method of utilizing seaweed. He boils the weed with carbonate of soda and treats the filtered solution with sulphuric acid, obtaining from it in this manner a substance that has more viscosity than starch, or even gum arabic, which may be profitably

employed in stiffening textile fabrics. It is also said to be well adapted for the making of syrups and for certain culinary uses. From the matter left after the extraction of that material—to which he has given the name of "alguna"—a very good quality of writing paper can be cheaply made.

**TO MELT OLD RUBBER.** such as old rubber car springs, scraps, etc., so as to be able to run it into molds for new work: Heat the india rubber with steam; the sulphur then discharges, the india rubber melts, runs into the hot water and collects at the bottom of the pot, while the vapor prevents it burning. The properties of the india rubber are thus sensibly modified; it becomes a blackish mass, liquid at the ordinary temperature, but drying in the air, and becoming then impervious to water. The material loses its elasticity, but is suitable for the preparation of gums or special varnishes for certain articles.

**SYMPATHETIC INK.**—An ordinary solution of gum camphor in whisky is said to be a permanent and excellent sympathetic ink. The writing must be done very rapidly, as the first letters of a word have disappeared by the time the last are written. Dipping the paper in water brings it out distinctly, and it becomes invisible again when the paper is dried. It can be brought out repeatedly without affecting its vividness.

**TO MAKE MOCKINGBIRD FOOD.** take of hemp seed three parts, toasted wheat bread two parts, maw seed one part, ox heart one part. Boil the ox heart well in water, cut it small, and place it in a pan in an oven, where it must be allowed to become perfectly dry and crisp. All the ingredients must then be thoroughly mixed and ground in a mill to coarse powder.

**HOW TO DESTROY COONS.**—An Arkansas farmer writes that last year, when coons made havoc in his corn-field, he went to the drugstore to buy strychnine with which to kill them. By mistake the druggist gave him morphine, and the next morning he found his field full of sleeping coons. He advises the use of morphine instead of strychnine.

**TO MAKE A GOOD POMADE for the hair.** take of castor oil one pound avoirdupois, pure white wax four ounces, melt them together, and then add oil of bergamot two and one half drams, oil of lavender (English) one-half dram, essence royale. Stir the mixture while cooling.

**CHEAP GAS IN LONDON.**—In London gas is furnished at the rate of 65 cents per thousand feet, and the companies pay dividends of 12 per cent. In Brussels the price is 85 cents per thousand feet.

## GOOD HEALTH.

## Disease Germs in Milk.

It is a well-recognized fact that the mother who is nursing her child is obliged to be very careful about her diet, for whatever she eats or drinks has its effect upon her milk, and consequently upon the health of her child. The most acute symptoms, and even death, may be produced by dietary indiscretion. But it is less appreciated that similarly alarming results may be produced in both children and adults by the use of milk taken from improperly fed cattle. There have recently been a number of mysterious poisoning cases, that after a great deal of random speculation have finally been traced to diseased milk. In spite, however, of these warnings, the subject has not yet received the sanitary attention to which it is entitled. Particularly is the danger of such contamination great in the neighborhood of large cities, where the absence of wholesome pasturage is a temptation to the less scrupulous to substitute all grades of organic refuse, the most of which should properly be consigned to the garbage crematory. In addition to this danger, however, it is discovered that even in the presence of abundant and suitable food, cattle are not discriminating in their selection, but exhibit frequently the most depraved tastes. In the neighborhood of large distilleries, it has been observed that the cattle become utterly demoralized by feasting on the refuse from the stills. In time they come to have the dull, stupid appearance characteristic of an opium-eater. It is hardly possible that the milk produced by animals permitted to feed on such abominable stuff can be either wholesome or agreeable.

In other places the case is even worse, for the cattle have been observed to feed with evident relish upon unadulterated animal excreta and other highly pernicious food. Aside from the disgust which the practice excites, it is a source of actual and grave danger. When it is remembered that the fatal plague at Plymouth, Pa., was directly traceable to the careless disposal of the excreta of a single typhoid-fever patient, it can readily be seen that milk may become in this manner a vehicle for the distribution of the most malignant disease germs. So large are the possibilities for evil which may result from the use of milk taken from animals improperly fed, either through design or carelessness, that it is not too much to ask that all public dairy farms should be placed under sanitary supervision, and that the food

and quarters of all cattle whose milk is offered for sale should be regularly inspected by officials appointed for the purpose.—*Scientific American*.

**GALEN ON THE TREATMENT OF OBESITY.**—"The best method of getting thinner consists in gradually withdrawing from the body that whereof there is superfluity, and in strengthening at the same time those parts which had been expanded. Bodily exercise will undoubtedly prove very advantageous, as we see stout horses getting lean by heavy work. Thus, likewise, those will never grow fat who are obliged continually to toil with hard labor. This, however, requires great precaution, it being certain that fat people frequently run danger of death when attempting violent bodily exercise." And Galen says: "Regular alvine motions, energetic bodily exercise, a moderate life, a diet which, although satiating, yields but limited nourishment; which explains why Hippocrates advises stout people wishing to grow thin to dine on vegetables cooked with fat, in order that they may become satiated by a small quantity of food."

**MEDICINAL QUALITIES OF OYSTERS.**—It is not as generally understood as it should be that oysters have medicinal qualities of a high order. They are not only nutritious, but wholesome, especially in cases of indigestion. It is said "there is no other alimentary substance, not even excepting bread, that does not produce indigestion under certain circumstances; but oysters, never." Oyster juice promotes digestion. By taking oysters daily, indigestion, supposed to be almost incurable, has been cured; in fact, they are to be regarded as one of the most healthful articles of food known to man. Invalids, who have found all other kinds of food disagree with them, often discover in oysters the required aliment. Raw oysters are highly recommended for hoarseness. Many of the leading vocalists use them regularly before concerts and operas, but their strongest recommendation is the remarkably wholesome influence exerted upon the digestive organs.

**WHY DID THEY ESCAPE?**—Mr. D. F. Newsom, of Newsom's Springs near Arroyo Grande, San Luis Obispo Co., Cal., states that during the cholera season of 1850-51, while that disease was prevailing in New York City to an alarming extent, he was employed in the brass finishing establishment of Dietz Bros. & Co., in that city; that there were about 100 employes around the factory, none of whom were at all affected by cholera symptoms, while others were dying by hundreds around them. Mr. Newsom thinks this highly suggestive, and that the hint given by the fact recited might afford good foundation for medical experiment with a tincture of the metal indicated.

**A LINIMENT FOR EARACHE.**—According to the *Canada Medical Record*, Pavani recommends a liniment composed of camphorated chloral 2½ parts, pure glycerine 16½ parts, and oil of sweet almonds 10 parts. This is to be well mixed, and preserved in a hermetically closed bottle. A pledget of very soft cotton is to be soaked in the liniment, and then introduced as far as possible into the affected ear, two applications being made daily. Frictions may also be made each day with the preparation behind the ear. It is claimed that the pain is almost immediately relieved, and even in many cases the inflammation is subdued.

**THE SMALL BOY WHO ATE SORREL.**—It was a very curious and almost unprecedented chain of causes, we imagine, which brought about the death of a little boy at Birmingham the other day. The poor child ate during the day a quantity of sorrel which he found near his mother's house. In the night, feeling thirsty, he drank freely of some soapy water which stood near his bed-side. Next day he died, and an inquest being held, the medical evidence was to the effect that the alkali of the soap acting upon the sorrel had formed oxalic acid, a poisonous compound by which the child had been killed.—*London Globe*.

**HEART DISEASE.**—Dr. A. L. Loomis, in a paper read before the American Climatological Association, says that in four cases which he details persons with heart disease were fatally affected by visiting elevations of about 2000 feet. Two went to the Adirondacks, one to the Catskill mountains and one to Colorado. In 26 cases of his immediate experience, he concludes that the removal from a lower to a higher level is in this disease detrimental. The diseases of the Swiss Alps are largely those of the heart, brain or the larger blood-vessels. There is more oxygen at sea-level than at a higher level.

**NEW TREATMENT FOR CONSUMPTION.**—The *Lancet* explains in a recent number a new treatment for consumption, as injecting carbolyzed iodine into the lungs by means of spray of the warmed fluid. The diseased cavities of the lungs are first localized by percussion; then a fine tubular needle, having openings at the point and attachment to a proper syringe, is introduced between the ribs, and the well-known antiseptic qualities of combination are relied upon to effect the healing of the affected parts. It is used once a week. So far, the treatment is quite satisfactory.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**PLYMOUTH CONSOLIDATED.**—*Ledger*, Aug. 28: Messrs. A. Hayward, W. S. Hobart and A. Van Norden, the three principal stockowners of this mine, were in Plymouth several days last week and left Sunday morning. During their visit a thorough inspection of the property was made, with the result that the reports that the mine is looking better than ever were fully confirmed.

**MARLETTE.**—Under the new owners, represented by W. Petre, work on this claim is being prosecuted vigorously. A ditch has been constructed to carry water from the Amador canal to the mine. The ditch will carry 100 inches of water. Three hundred feet of pipe will be required, which is being hauled on the ground and placed in position. Hoisting works are being erected in the tunnel for the purpose of sinking a winze. These works will be run by water-power by means of one of Knight's wheels.

**MISCELLANEOUS.**—Dan McKay has sold his mining property and residence at Scottsville to A. P. Minear for the sum of \$30,000. The purchaser takes possession at once and intends to push the work of development without delay. The McKay mine is in Hunt's Gulch, north of the Doyle claim. It is the intention to sink a shaft at once. A quantity of tools and material is already on the way. Dan McKay is to superintend the operations. It is the prevailing opinion that the chances are favorable for the development of a good mine at this point. The 40-stamp mill of the Kennedy is going up like magic.

**SUTTER CREEK.**—It is now definitely settled that operations at the Eureka shaft are to be abandoned. Orders have been received from headquarters to take out the pump. Previous to this, however, a substantial bulkhead was built in the tunnel at the 1500-foot level. It is built of stone six feet thick, and is evidently intended as a protection to workmen in running a tunnel either from a new shaft or the old works. The bulkhead has been put in about 50 feet from the shaft, and the men, in drifting from the old works, will be able to tap the tunnel with safety. To connect the two shafts it will be only necessary to put a few cartridges of giant powder under the mason work and blow it up. The Lincoln is running at the usual gait. The mill is running to its full capacity, with enough rock in sight to last for a considerable time yet. The ten stamps of the Iowa are running steadily with encouraging prospects. Work on the additional ten stamps of the South Spring Hill mill is in full blast, with occasional stoppages on account of the lumber. It will take from a month to six weeks to complete the job.

## Calaveras.

**INDIAN CREEK.**—*Mountain Echo*, Aug. 25: The Sature mine is closed down for an indefinite period. The Bean mine is at a standstill for the present. Work is progressing slowly at the Kelly mine, recently purchased by a San Francisco company for \$10,000. The east shaft of the Calaveras mine, which has been in operation for some months past and has made rich returns, is temporarily closed down. The old shaft, 400 feet in depth, is being freed from water preparatory to the inspection of the same by an English company that intend purchasing it. This is a very valuable property and we would be pleased to see it fall into the hands of a wealthy company.

**COPPER MINE.**—*Calaveras Prospect*, Aug. 27: A San Francisco company has taken hold of the Satalite copper mine in Campo Seco. The water is being pumped out of the old works, and as soon as that is completed a 50-foot water-wheel will be built to run the machinery. This company have worked other low-grade copper mines in this State, and are satisfied that the mines in Campo Seco can be made to pay by the roasting and leaching process. Five men are employed at present, and in a couple of weeks the company expects to employ 12 or 15 men. W. C. Reveal is superintendent.

**MURPHY'S.**—It is currently reported that Mr. Cox, of San Francisco, has bought a half interest in the Tulloch mine, on the grade, and the Pocket mine of Dodson's, and that the erection of a ten-stamp mill is one of the possibilities of the next two months. The Oro Plata mill has closed down, pulverizers still running, but the closing of the whole works will take place in a few days on account of the turning out of the water.

## Fresno.

**COAL.**—*Expositor*, Aug. 25: Mr. Rawlins, of the firm of Robinson & Rawlins, proprietors of the coal mines 18 miles southwest of Huron, is in town, having tests made of some of the coal taken from their mines. The coal was used by a limited number of persons here last season with satisfactory results, and if the Water Works and other enterprises become satisfied of its value arrangements will be made to ship it extensively to this place.

## Los Angeles.

**THE NEW STRIKE.**—*Times*, Aug. 28: Among all the mines of gold, silver, iron, copper, etc., developed or discovered in the county, the latest strike appears to be one of the most promising. We yesterday noted the fact that a fine ledge had been discovered on Wilson's Peak, and that a lively boom was in its incipency. On the 6th of June last Frank Dunham, a veteran prospector, discovered the ledge. He was up on Wilson's Peak, at a point about seven miles from Lamanda and about 300 yards from a favorite camping ground of those who go up the mountain. The ledge, which is of as promising quartz as ever miner clapped his eye on, is from two to seven feet wide and vertical. By following the numerous outcrops the ledge can be traced for at least three miles. The walls are also clearly defined and it is evidently a true vein. Wood and water are there in great abundance—huge trees and a spring of the finest water. The ledge runs along several ridges in places with deep arroyos on each side. At one end of the plateau which Mr. Dunham prospected—in company with his partner, Ed. Pettibone—there is a precipitous bluff about 300 feet high, with an angle of about 55 degrees. Getting down this bluff by means of a rope, the prospectors found

the vein visible all the way down, and were thus enabled to get an idea of what the vein is at a depth of 300 feet. With a pick they dug out some little chunks of quartz glittering with free flake gold. The very top drift is good stuff, and when pounded up with a hatchet and panned out in a wash-pan, shows numerous colors. The exhilarated party brought in a lot of the ore, and a large specimen is exhibited in Bartlett's show-window in the new Wilson block, First street. It is simple drift but a superb piece of rock. Assayer Spurl has made one assay of the ore, getting a return of \$369.60 to the ton in gold, with traces of silver and copper. Mr. Dunham is associated with Ed. F. Pettibone, a member of Frank Bartlett Post, G. A. R., and an experienced miner, who has delved in Kentucky, Colorado, New Mexico and various localities in this State. He has some promising mines in the rich Cactus district near Yuma. Dunham & Pettibone have taken in with them the following: J. L. Stern and John C. Hester, of Stern & Hester; G. A. Stewart, F. H. Rawlings and Sam. McConnell. These gentlemen have staked out two 1500-foot claims and propose to whoop it up in big style. Said Mr. Stern yesterday: "We will put a big force on Monday to make a new trail, for the old one is too roundabout. The new trail will make the mine not over 10 or 11 miles from Pasadena." Mr. Pettibone starts in a day or two for San Jacinto, where he has some burros. He will bring them up to Lamanda and use them for packing to and from the mine—which is, by the way, but two and a half miles from the north fork of the San Gabriel.

**SAN GABRIEL.**—Mr. H. Martz, one of our heaviest capitalists, is associated with Mr. Samuel Holyland in developing a valuable claim, situated and lying just west of the Winston mine. Scientists tell us that the region of country washed by the San Gabriel and its tributaries is—with the exception of a similar area in the State of Maine—the oldest formation on the American continent, and that we have there all the conditions known for the existence of mineral-bearing ore deposits. This region of country has been the theater of mining adventures by the Spaniards from time immemorial, and many are the legends that have come down of the golden caverns, native silver lodes, and other rich finds of gold and silver made in the days of the Jesuit Fathers of a century or more ago. Here at our door lies a mineral belt, vast in its extent, and rich as it is boundless in the precious metals, still as yet but little known, and comparatively unexplored by the mineralogist of to-day. In the gulches and along the banks of the San Gabriel, for a distance of 40 miles, over five millions in placer gold have been gathered within the last two decades, and the bed of the river for that entire distance is even now paved with gold, but from its peculiar surroundings cannot be worked; and yet with all the prospecting that has been done for 25 years, the source, or matrix, from whence this gold came remains a mystery still, and confounds all theories extant as to gold formations. The fact that the mountain, gulches and ravines of this mineral region abound with forests of timber, and the San Gabriel, with its numberless tributaries, affords a never-failing supply of water, together with the additional fact that it is within two hours, on foot, of orange groves, vineyards and civilization, seems to detract from rather than add to its importance. With less than one-half of the showing in mineral wealth that can be made here, were it out on the desert wastes of Death Valley, invested with all the enchantment that distance lends, it would not fail to attract capital and invite the attention of mining men. One 20-stamp mill running in the San Gabriel Canyon, making its monthly shipments of bullion, would give an impetus to affairs there never before known, and mark an important era in the eventful history of this mining camp; and there is sufficient free milling ore, of fair grade, to be found there and placed within reach by the expenditure of a little capital, to keep a score of 20 stamp mills running for all time to come.

## Placer.

**MINING NOTES.**—*Placer Argus*, Aug. 26: Wm. Hollis, of San Francisco, a former old-time resident of Michigan Bluff, has bought a large tract of mining ground at Last Chance. It comprises part of the Viola, Morning Star and El Dorado claims. He is now running a tunnel to tap the ground which there is every reason to suppose is rich. The old tunnel was found to have been run too high. At the Bald Mountain gravel mine, about six miles above Last Chance, eight men are employed, and have been for over a year past, with every encouragement for hoping that a rich body of gravel will be struck at an early day. The owners of the mine are: Hon. J. H. Neff, Peter Juergenson, Alex. Dolt and William McLennan. Mr. Dolt is the superintendent. About half of the men employed at the Hidden Treasure mine, Sunnysouth, have been laid off temporarily, owing to the pitching of the bedrock in the pay channel. The gangways must be cut down to the level of the pay channel. The entire force will again be put to work, probably in two weeks. The gravel at the pitch-off is richer than it has been for the last year or two. A new mining company are at work between Sunnysouth and the Dam claim on the east side of El Dorado canyon. A tunnel is being run in this mine with very good prospects. The operators are Messrs. Williamson, Buell and Masters. Four men are working there. The Dead Horse mine on El Dorado canyon, which has lain idle for several years, is now running full blast, the Sutcliffe Bros. having taken hold of it some months ago. They are doing well. Interest is reviving in the claims on the river bars and "slides" in this vicinity. Hanson & Co. are fitting up a mine on Yankee Slide (between Gray Eagle and Volcano Bar), and Jensen & Hubbard are fitting up the Red Hot mine near Brushy Bar. The Van Emon Bros. are rigging up their mine, the Big Gun, for a drift mine.

## Shasta.

**DEADWOOD.**—*Shasta Courier*, Aug. 28: Dr. DeGroot has been here collecting data and information in this section for the State Mineralogist. Chief Crowley, of San Francisco, was here yesterday spying the fatness of the land. He and Col. Gannon own three-fourths of the Scorpion mine in French Gulch, W. T. Coleman the balance. Dan Phillips is now foreman of Tom Greene's mine, and right well does he attend to his duties. The Gibson Bros.' group of mines, including the Black Bear, White Bear and Enterprise—Little Gem ledge is on the latter—have been bonded to an Eastern man, who has gone back to perfect arrangements for com-

mencing operations. Lamb & Co. have had a cleanup and are well satisfied. Dick Roberts is working three shifts, day and night, in the McDonald Brothers' big tunnel. The dump pile prospectors are making good wages. Mr. J. Falan has leased a part of the Vermont mine to Messrs. Wren & Leas. McDonald & Olive have been prospecting for the past week for a site to erect chlorination works, and have at last fixed on the south fork of Deadwood gulch, and commenced grading for that purpose. Collins & Barkle have commenced operations on what they call the "Mammoth Ledge," situated near the old Sargent cabin, about half way between here and Lewiston, and within a half mile of Paulsen's arastra; the walls are 24 feet apart and on one there is four feet of good-paying ore. Being so near the arastra will be an advantage. Success to them.

## San Bernardino.

**PROVIDENCE MOUNTAIN.**—*Calico Print*, Aug. 22: The Bonanza King Co. is still prospecting its mines, and has cut several ore bodies, but is doing no work on ore. It keeps 20 to 25 men to work constantly. A few gold-rock miners could get work. The Kerr and Patton property, which changed hands a few weeks ago, is not yet working. Mr. Bahten is expected to commence operations almost at any time. Some developments are being made on water. The mill is going to be erected at the mine and the water pumped to the mill. The Mozart group of mines, about two miles south of the Bonanza King, has just run through a 12-foot vein of ore on the Lucknow mine—one of the group. The ledge was tapped by a tunnel at the depth of 100 feet. This is probably the largest strike ever made in the camp.

**MESCAL.**—The carpenters, machinists, etc., have arrived at this camp, and the Cambria Mining Co. can congratulate itself on the way the mine is opening up. Every day's work shows the mine improving both in richness and quantity. The grading for the five-stamp mill is about completed, and heavy timbers are already on the ground. Mr. E. H. Booth, a practical machinist from the works of M. S. Baker & Co's City Foundry & Machine Works, of Los Angeles, is already on the ground. The machinery is from this foundry, and they mean to show San Francisco that they can erect as good a mill as any other place on the coast. The Ivanpah mills are both shut down, and but little chloriding is being done. Wilt & Sidel are sinking a shaft on their find on the west of Providence mountain. They commenced the shaft on the gold vein which is gradually widening, are now down about 15 feet, and the ore appears to keep up its richness both in gold and silver. Some old prospectors are on the field in hope to make a strike.

## Sierra.

**LA PORTE.**—*Mountain Messenger*, Aug. 28: This mining camp has now a good prospect of a fresh lease of life. The sale of the Gibsonville and La Porte ridge is about completed, and the money will be paid as soon as some of the titles are perfected. The purchasers are Scotch capitalists, who will run in a tunnel from a point near Gibsonville, 7000 feet to develop the ground. J. H. Thomas is entitled to much credit for the successful manner in which he has engineered this mining business. Col. Plum, of Chicago, will soon put in machinery to sink a shaft to open the Bald Mountain Consolidated ground, near La Porte, that promises to fully equal, if not excel, in richness the leads of the Bald Mountain and Extension of Forest City. The results obtained by the boring machines are indisputable proof that the channel extends through the ridge to Gibsonville and beyond. J. H. Thomas, of Oakland, was here Monday, Aug. 16th. His headquarters are at Saw Pit Flat, Plumas county, where he is superintending mines for Scotch capitalists.

## Tehama.

**CHROME.**—*People's Cause*, Aug. 28: Job Comings and Frank Brothers, of this place, have made a discovery of fine chrome deposit in the Coast Range, upon which they have located four claims. An assay shows 58 per cent oxide of chromium and 1 1/2 per cent peroxide of iron. The deposit is extensive and of fine quality, yielding chrome yellow, blue, green, chocolate and a beautiful red. There is also in the vicinity of this deposit of chrome, protoxide of barium, yielding a snowy white which is also of considerable value. This is the second discovery of chrome within the past few weeks in the foothills and mountains of the Coast Range, besides other ores, the character of which has not yet been made known by assays. Samples of these are still under examination by experts, showing that the mineral wealth of Tehama county has not been half told.

## Trinity.

**EAST FORK.**—*Trinity Journal*, Aug. 28: The Crown Point is showing flattering indications of being a good-paying mine. An incline shaft, 100 feet deep, has been sunk on the ledge, which at this depth is 34 inches in width and carries free gold and galena sulphurets. The assays have run all the way from \$39 to \$300 per ton. A trail has just been completed from Backbone mountain to the Golden Chest, the furthest mine up the creek and about 15 miles distant from the town of North Fork. It is owned by Haley, Given & Hubbard. Development of the ledge is now progressing. The ledge is a mammoth one, and the rock well seasoned with the yellow treasure. If we are to believe the rumors in regard to this mine, it is a veritable "golden chest." The North Star mill will start up in about two weeks and will run on some splendid ore; the company having 70 tons of rock on the dump. New stamps, etc., have been procured and the mill generally refitted. Day & Moor have a good chance to make some money on a ledge they are developing, and work on their arastra is still going on, and will be finished shortly. Lawton, Bergin & Bailey, of the Thanksgiving mine, are still getting out good ore, and have made very satisfactory cleanups. Barney McDonald, of the Enterprise, is doing likewise. These two mines employ quite a force of men, and both have arastras. There are other locations in the district, which, if worked upon and thoroughly tested, would no doubt turn out to be good mines. Christ Meckel's pack-train from North Fork makes trips to the various mines almost daily, carrying in supplies, etc. There are upward of 60 men in the district. That East Fork is a better camp than it was a year ago we are all aware, and from present

indications it certainly looks like it would develop into a prosperous, well-to-do mining district ere many more years elapse.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—*Enterprise*, Aug. 28: A less amount of ore is being shipped, but of a better quality—about 175 tons per day, assaying according to mill battery samples over \$20 per ton. The drift being run northwest on the 1400-level toward the Ophir is now in 170 feet. The two crosscuts west from this drift are making good progress in very promising vein matter. Some small streaks of good ore are said to be found on this level, creating a temporary stir in the stock market, but official authority says "there's nothing in it." On the 1500 and 1600 levels they are progressing well in the explorations.

**BEST AND BELCHER.**—West crosscut No. 1 on the 600-level has been extended 39 feet, making a total of 183 feet. East crosscut No. 1 on the same level is 123 feet in length, 40 feet having been added during the week. Material in both drifts continues to be vein porphyry with seams of clay and quartz. On the 2500-level the construction of the stone bulkhead or dam to shut off the water flowing in from the northward is steadily progressing.

**SAVAGE.**—The good ore vein developed on the 600-level shows better as farther opened out. A large proportion of it assays \$300 per ton. During the last few days the old 800-level of this mine has been reopened from the Gould and Curry mine and drifting south is being done, with a view to finding if the rich vein on the 600 extends down to that point. Should it be found to do so, Savage may become a dividend mine again.

**POTOSI.**—Running the diamond drill to the eastward on the 3100-level near the Chollar south line was suspended on Wednesday last, a distance of 404 feet having been accomplished. This hole has passed through one of the heaviest veins of clear white quartz ever found on the Comstock. It is quite strongly mineralized, but no pay ore has been met with as yet.

**CHOLLAR.**—The south lateral drift on the 3200-level is now in 190 feet—face in dry ground. The course of the drift has been changed a little to the west, as there were slight indications of water in the face. Portions of the drift have had to be additionally timbered by reason of the soft character of the ground through which it passed.

**MEXICAN AND UNION.**—On the 700-level the northwest drift in the Union is going ahead properly in favorable ground, and is 200 feet in length. The cutting of a drain in the Mexican mine throughout the floor of the 700-level progresses well. The Mexican and Union should consolidate forthwith.

**GOULD AND CURRY.**—From the lateral drift north on the 450-level or working station 150 feet above the 600-level, a west crosscut is being run, which is now in 44 feet. Material vein matter with some quartz and clay. The drift northeast from the head of the incline upraise was extended 35 feet, making a total length of 47 feet.

**HALE AND NORCROSS.**—By reason of the slight pump disarrangement in the Combination shaft, mentioned elsewhere, work has been suspended on the 3200-level. This difficulty will be obviated to-night, however, and all work go on as before.

**CROWN POINT AND BELCHER.**—As before stated, the repairs and resetting of the incline engine are being energetically pushed forward to conclusion, in readiness for the resumption of work in the two mines on the first of next month.

**OPHIR.**—On the 1465-level the main southwest drift is making good advancement in very favorable vein material. On the 1300-level the south drift from the shaft is also pushing ahead in excellent working ground.

**SIERRA NEVADA.**—On the 520-level the north lateral drift has been extended 18 feet, making a total length of 548 feet. A crosscut, No. 3, has been started near the face of this drift, which is now in 29 feet.

**YELLOW JACKET.**—The daily yield continues to be 100 tons, giving the Brunswick mill all it can do during the present low stage of water in the Carson river.

**MONTE CRISTO.**—The repairs to the hoisting works are completed and work resumed on the 150-level from the new shaft, running west for the ore vein.

**ALTA.**—Crosscutting is about being commenced on the 700-level to develop the ore resources so long sought at that point.

**KENTUCK.**—Daily yield, 40 tons from above the 800-level, of low-grade ore, keeping the Rock Point mill steadily running.

## Belmont District.

**WHAT IS DOING.**—*Belmont Courier*, Aug. 21: The Reveille mines are producing good ore, and the mill is running steadily. John N. Griffin is taking some very nice ore out of the Highbridge mine. He will make another shipment to Eureka some time in September. Shipments of gold bullion will soon be in order from the mill of Leonard, Cruckshanks & Warne, Ophir Canyon. The ore from their mine carries gold of a good grade. The low-grade ores of Nye county can all be profitably concentrated as soon as silver advances to a decent price. The discount is too heavy at present for low-grade ores to leave any margin of profit for those who handle them. The Alexander mill at Grantsville is running steadily on ore from the sixth level of the Alexander mine. The Golden Gate concentrator is a success, and does its work easily and well. Work will shortly be resumed in the Brooklyn mine. There are 13 families and about 50 men residing in Grantsville.

## Esmeralda District.

**MOUNT DIABLO.**—Report for the week ending August 24, 1886: The incline is now 88 feet below the 8th level. The west drift on the 8th level is in 246 feet. The winze from the west drift on the 7th level is down 120 feet and the south crosscut from this drift is in 52 feet. We are in 350 feet in the north crosscut from the west drift on the 6th level, and the south crosscut from this drift is in 148 feet. The north crosscut from the east drift on the 6th level is in 149 feet. We are sinking on some low-grade ore in the intermediate between the 5th and

6th levels. The raise from the intermediate between the 4th and 5th levels is up 28 feet and shows a foot of \$70 ore. A final bullion shipment of \$21,347.02 was made on August 20th.

**PALMETTO.**—*True Fissure*, Aug. 28: R. B. Catherwood, of New York, one of the principal owners of the Palmetto and Silver Peak mines, arrived here last Wednesday on his way to inspect the operations now being carried on at the former place. The report that all work has been stopped is false, and came about this way: When the second level in the Champion was reached, it was found that about 500 tons of waste had been thrown into the shaft from the stopes above. Not caring at present to do the dead-work that the taking out of all this debris would involve, Mr. Catherwood telegraphed from New York to stop all work on Champion shaft and put more men at taking ore from other mines. Work will be continued until spring on the President, Pearl, Diamond, Treasurer and Kentuck, when enough ore will be on the dumps to insure a long mill run. In the spring two 10-stamp mills with capacity for 20 stamps will be built, one at Palmetto and the other at Silver Peak. The property is all owned by four men, and as they are all wealthy and their ore carries about \$40 in gold, the silver scare does not affect them in the least.

#### Hawthorne District.

**HAPPENINGS.**—*Bulletin*, Aug. 25: Assessment work on the Nevada is uncovering some very fine ore. Moss has again struck a body of rich ore and everybody about Kinkead is happy. Moss district is reliable as a gold producer. Arthur George has taken another lease of the Pamlico, and within the last week struck another body of the rich rock with which he formerly surprised the gold hunters of Hawthorne district. A very large body of low-grade gold rock in the Lapanta will be resolved into dividends when the mill is built. In the meantime, the rich rock is being shipped daily and there is enough in sight to continue shipments for a long time. Work is still progressing on the "85," at Aurora. The last ore worked at the Miner's mill, under the direction of H. W. Tangerman, gave a very satisfactory result, and demonstrated the fact that low-grade ores can be profitably worked. The difference between the assay value of the ore and the assay value of the bar showed about \$3 lost in the tailings. In running over copper plates about two-thirds of the assay value is gotten out of the rock. The pulp is then run into tanks and worked in slow-motion pans; by this means excellent results are obtained. Mr. Tangerman has now an offer to have a suitable mill erected at the mine. Should the supply of water prove sufficient to run 20 stamps, a mill of that size will be erected with copper plates, concentrators and slow-movement pans and settlers. Mr. Tangerman calculates to work the rock at an expense not to exceed \$3 a ton.

#### Pioche District.

**NEWS.**—*Pioche Record*, Aug. 21: Charley Roe, owing to the supply of salt having given out, was forced to close down his works at Bristol. It is the intention of the Pioche Con. Co. to construct tanks, of a daily capacity of 50 tons, for leaching purposes. The screenings will first be put through the common process, then afterward treated by the Russell process. It is the intention of the Pioche Con. Co., so Mr. Godbe stated, to at once place the Raymond & Ely in order and extract black ore, which will be shipped to Bullionville, where rolls are to be placed in order for crushing ore, and that the ore will be worked by a new leaching process, the tests of which have given good results. The news from the Ouondago mine is very flattering. While running along the 18-inch ore streak going to the east, Thursday evening, a couple of shots disclosed a breast of extra rich ore four feet in width. The ore at the end of the drift running south is now going down perpendicularly. It is thought that they are just on top of a big body of ore. The mine gives great promise of being a valuable one.

#### Tuscarora District.

**NAVAJO.**—*Times*, Aug. 27: The usual progress has been made with the work at all points the past week. The stopes are yielding the usual grade and quantity of ore. Shipped bullion to the amount of \$8467.98.

**NORTH BELLE ISLE.**—North drift from No. 3 crosscut was extended six feet the past week. The vein shows considerable high-grade ore. From No. 1 crosscut, 400 feet north, the north drift is being advanced on the vein, and is developing a good width and grade of ore that carries from 20 to 40 per cent gold. The new hoisting works are being put in good repair, and as soon as work can be resumed at this shaft, crosscuts will be started at various points on the different levels.

#### COLORADO.

**MINES AND MINING.**—*Georgetown Courier*, Aug. 26: The Osburn & Nunn stamp mill on Fall river, will soon be in running order again. An engine and boiler will be added so as to keep the mill running during the winter. The lessees on the Ouida lode, Chicago creek, had a shipment last week which returned them \$327 and \$109 per ton, according to class. The boys report having a very fair streak of this kind of ore. Chris. Turpin reports the crosscut tunnel which he is driving for the Argentine lode as having reached a distance of 200 feet, with 30 feet further to go to cut the lode. The Argo mine produced about 20 tons of high-grade ore during the month of July. The Brunswick lode, Cascade creek, has recently been purchased by J. F. Depew, who has put a number of men at work. The drift on the South America lode, Ute creek, is now in 250 feet. On a cross-lode, about 150 feet in from the mouth, is being worked. A vein of high-grade ore has been opened up. Mr. G. Barnett has leased the Racket lode, on Chicago creek. The drifts from the 60-foot shaft show fair veins of mineral, which mills \$150 a ton. It is reported that a new body of ore has been opened up in the Mattie mine, from 3 to 16 inches thick, of good grade. Al. Penery & Co., lessees on the Tiger lode, Chicago creek, are working the 100-foot drift, which shows ore carrying ruby silver and gray copper in quantity. A tunnel was located on Red Elephant mountain last week, by J. VanAulken. He states that work will soon be commenced upon it. At 500 feet it will cut the Tabor, when the work will proceed on that vein, to the Red Elephant company's property, opening these up at a

depth of about 1000 feet. Several Georgetown miners have gone over to Montezuma to work on the Silver Wave mine. The Queen of the West mine, in the Horse Shoe, is producing ore which mills \$1,000 to the ton. Sixteen men are at work on the property. The work of sinking the shaft upon the Norman lode, Sherman mountain, is now progressing, the bottom of which shows a very fair vein of ore. Fred Johnson and L. C. Billings are working their Mary Ann. There is a big showing in the breast, and with constant development will yield well. The boys are steadily pounding away. The crosscut tunnel now being run to cut the Rip Van Winkle lode, on Sherman mountain, is in close proximity to the objective point. Several small feeders have already made their appearance, indicating the nearness of the vein. Wm. Shavallia & Co. have taken a contract to drive the crosscut tunnel running to reach the East Muscovite lode, Democrat mountain, a further distance of 60 feet, which it is expected will reach the objective point. The St. Louis lode, on Capital mountain, is improving as the drift is being pushed ahead. The breast now shows a vein of mineralized quartz about ten inches thick. A building, 20x40 feet, is in course of erection. It will be used as a boarding-house. The 7:30 mine is being worked by a force of from 75 to 80 men, and has improved considerably during the past week. Twelve drifts are progressing. Several winzes and raises are also under way. A good-sized vein of high-grade ore has been opened up in the 370-foot level east, which shows considerable gray copper and ruby silver. The outlook of the property never was more promising. Every level shows ore in good-paying quantities, and the ore-house is full of assorted mineral ready for shipment. About 50 tons of unassorted ore is now piled up on the dump. Our "sailor" prospector, C. W. Evans, has opened up another good showing on McClellan mountain. Four inches of nearly solid ore has been encountered, of a very fair grade.

#### ARIZONA.

**ABOUT PRESCOTT.**—*Courier*, Aug. 27: The latest from Alexandra, Peck district, is a bar of silver weighing exactly 73 pounds, which W. C. Dawes sent in by last stage. Jim Shirley, driver of the stage, gave us this silvery "note" and also stated that Mr. Dawes has the water pretty nigh out of the Peck mine and expects, in a week or two, to be crosscutting in the levels of the Occident ground. In Turkey creek district, Messrs. Brann & Mitchell are taking very rich gold rock out of one of their mines. The new ledge in Walker district continues to yield plenty of rich silver ore. Castle creek mining district in this county is having a healthy boom just now. Monday evening that veteran prospector and miner, Willard Rice, returned from the May Flower mine a one-half interest in which, with several adjacent locations, have been recently sold by Chas. Thompson to A. E. Foote. Mr. Rice was laden with samples prudently and carefully selected by him from different parts of the mine. He reports a great abundance of free-milling gold ore. One sample taken from the 700-foot level was found by Assayer Stahl to yield \$161.22 in gold and \$358 in silver. This sample is asserted by Mr. Rice to be below the average of quality of ore found in great abundance on the level from which it was taken by him. Another sample taken from crosscut to foot-wall about 65 feet down, assaying \$20.09. Mr. Rice, who is a level-headed pioneer, well posted in all that pertains to mines, is enthusiastic over the prospects and developments of Mr. Foote's purchase.

#### DAKOTA.

**ITEMS.**—*Lead City Tribune*, Aug. 20: Clara Nevada is shipping ore to Omaha. Steel galena is reported to have been discovered in the Big Chief mine. A night and day shift is employed on the Minna mine, in the Bear Butte district. Work is about to be resumed on the Lady Washington, just north of Lead City. Four bars, the aggregate weight of which was about \$3850, were brought in yesterday from Iron Hill. Charles Hardin, of Two Bit, claims to have obtained \$17 with the use of a mortar and pestle from Good Enough ore a few days ago. There is a large body of ore—carbonate and galena—in the quartzite in the bottom of the Cold Creek canyon, near Richmond Hill. It is reported to assay well in silver. It also carries gold. Deadwood parties have received a charter for sampling works in that city. Thirty thousand dollars have been subscribed to forward the enterprise. If properly conducted it cannot fail to be a great benefit. The Annie mine, on Spruce gulch, is to be opened by a tunnel. It is located some distance below the present workings. A body of good gold ore has recently been discovered in the lower workings of the mine. Some rock lately brought over from the Mugwump, at Carbonate, looks remarkably well. It carries silver. The hoisting plant which has been ordered for this mine is said to be finer than any other at the camp. The directors of the Mugwump Mining Co. held a meeting at the rooms of the Lead City Board of Trade to-day and issued an order to commence the erection of the building for the hoisting works.

#### IDAHO.

**NEWS.**—*Ketchum Keystone*, Aug. 21: Two cars of ore from Bayhorse were dispatched to Omaha on Wednesday. T. E. Clochey & Co. have, during the week, purchased about 50 tons of ore from the various mines. Two carloads of ore from the Carrie Leonard were received during the week, and sent to the sampling works at Hailey. Seven and one-half tons of ore were received at the Sampler from the Buzzo group of mines during the week. During the week ore has been received at the sampling works from the King of the West, Kate May and Buzzo mines. One car of bullion from the Clayton smelter was sent to the separating works at Omaha, during the week, by the Idaho Forwarding Company. The prospects of the Ophir mine brighten every day. The vein of ore mentioned in last week's review continues to gain in width and now shows over 40 inches. The owners propose putting on more men and work regular shifts. Work on winter quarters will soon begin. Thomas Popham has bonded the Albion mine, Cassia county, for the term of six months, the consideration being \$3000. He will leave next week for the mine and intends to do considerable work before snow flies. The property shows a good prospect, and Tom is sanguine that the Albion will, in a

short time, make a good showing. About three tons of good ore was brought to the sampler during the week from the Kate May, at Galena. The mine is being worked by Messrs. Knadler & Spaulding. The ore will go about 120 ounces silver and 60 per cent lead. The work being done on the mine is only on account of assessment. The Bayhorse Smelting Works will start up September 1st. Andrew Cassidy, an old coaster, is on his way to put up a smelting furnace. The above item we find in the *Idaho World*. As yet Mr. Cassidy has not arrived. Forty tons of Skylark ore is on the way from Clayton, to be forwarded to the Omaha Smelting Works. The ore is all first-class.

#### MONTANA.

**PHILLIPSBURG.**—*Butte Miner*, Aug. 25: Just now a large number of St. Louis people are in the city attending the election of the Bi-metallic Company, (the owners of the James G. Blaine lode), the annual meeting of the Granite Mountain Company and generally looking after their vast interests here. The St. Louis people have taken a strong hold upon the mineral properties of the camp and they have been very successful. They own or control the Granite, probably the richest mine in the world; they also control the Hope property with its mill, and have recently organized the Bi-metallic Company, through the instrumentality of which they are developing the well-known Blaine lode. The annual meeting of the Bi-metallic Company was held yesterday and among the directors elected is Josiah M. Merrill, of Butte, who was subsequently elected general manager also. The Bi-metallic property adjoins a 60-foot fraction of the West Granite which lies between the Granite and the Bi-metallic. The property is now being developed. A shaft is being sunk and is now down 190 feet. At 200 feet a station will be cut, when they will crosscut to the north, with the hope of cutting the vein of the Granite mine. Much water has been encountered, but so far no indication of ore. It is estimated that the vein which they are seeking will be encountered 80 feet north of the 200-foot station. About 150 feet west of the present workings the company has a shaft 50 feet deep, being the original discovery shaft of the Blaine lode. In this shaft some very rich ore has been found, but the vein is narrow. The Granite is unquestionably the richest mine in Montana, if not in the world. With its 30-stamp mill it manages to declare \$100,000 a month in dividends—a grand total of \$1,200,000 a year of net earnings. The company is now erecting 40 additional stamps, which will double the present output and one-third more. So we may reasonably expect that the net earnings will soon exceed \$200,000 a month. The mine is now developed by five tunnels, and a level under tunnel No. 5, known as No. 6. These workings have thoroughly exposed the richness of the mine and the area of the deposit. It is estimated by competent persons who have inspected the mine that at least \$16,000,000 is now in sight. The mine is carefully managed and scientifically developed under the direction of Captain Plummer, the general manager. The Granite is a veritable bonanza. It is in No. 6 where the richest ore is now being found, and where they also have the largest body; and it improves in size and richness as development is pushed. The richest ore taken out of the mine—said to average nearly \$1000 a ton—is sacked and shipped for reduction, being smelting ore. The Hope Company has thoroughly prospected old Hope hill and established the area and continuity of the mineral deposits upon which the company's mill is dependent. It is estimated that there is now ore enough in sight to keep the mill busy for at least three years—or more than has been in sight at any time since the company was organized. The ore is low grade, carrying about 16 ounces and free milling. The mine is exceedingly "faultry," no less than eight faults having been encountered last year and four this year to date. The ore is found in pockets. The exceedingly low grade of the ore and the expensive character of the mine has been overcome by the present manager, G. H. Babcock, in immense reductions in the cost of reducing the ores. The mill consists of ten stamps. It crushes 34 tons of ore a day and reduces ore at \$3.75 per ton—the best work, probably, done by any mill in the country. Mr. Babcock hopes to reduce this cost to \$3 next month. The present cost of extraction and reduction is \$9.83. The hope of Phillipsburg is the West Granite mine. This is the property some time since acquired by J. K. Pardee for himself and a syndicate of Helena capitalists. This property adjoins the great Granite mine on the west and is believed to contain the extension of that vein. Tunnels numbers 5 and 6 of the Granite are only between 200 and 300 feet from the side line, and the trend of the bonanza vein certainly seems to be into the West Granite claim. There are many reasons for believing that the Plummer vein of the Granite will be found in the West Granite. But faith in the West Granite is not based upon this theory solely. A tunnel has been run 540 feet. At 400 feet from the tunnel mouth, the header was deflected from a northeast to a course very nearly due east. At 100 feet from point of deflection the vein was struck. Owing to the large amount of water contained in the vein the entire level was filled with vein-filling and broken quartz. Examination showed that they had been paralleling the vein for 100 feet. The vein was crosscut 30 feet back of the header, a square set put in and the level again started on the vein. The inclosing rock was found not to be disturbed. Sixteen inches of ore laid to the hanging wall against a 12-inch clay casing. Against this one lay three feet of pink manganese. This constituted the vein. At the crosscut west of the header—at the point of deflection—20 inches of very high-grade rock was found, the vein being about the same width as at the head of the header. This level is pushed west on the ore body, which increases in size, of a uniform richness. This is the farthest west that ore has been found in the camp and indicates that, as in the Granite, the vein increases in richness as it goes west. The ore now taken out averages 400 ounces, though ore is taken out that runs 600 and 800 ounces. Mr. Thomas Cruise, the president of the company, is now in the camp, and examined the property yesterday. He was greatly pleased with the mine and says that the work of development will be rapidly pushed. Mr. Cruise and his Helena associates being ready to put up all the money that may be required. Engineer Kellogg has surveyed a shaft for the company, and work on sinking it has begun. It is the intention to sink

500 feet at once and then prospect the property systematically. The miners of the camp and the people generally have every confidence in the West Granite, and an unusual amount of stock is held and is daily being bought out of the savings of the people. They confidently believe that they have another bonanza in sight. The company property is very extensive, comprising eight claims, all lying south and west of the Granite and further down the mountain side.

**SOUTH SIDE MINES.**—Having mentioned something about the mines on the north side of Alta City, I will now undertake to mention a few on the south side. Our enterprising miner, Ed. Haines, has secured a lease on the ground taken from the old Emma years since, east of Alta near the creek. He expects to erect a jiggling apparatus to work the same. The Jack mine, the property of Charles M. Sickler and James R. Tainsh, has been successfully worked this summer under the direction of Mr. Tainsh. Mr. James Wall, our old recorder, a few days since developed a good rich vein of high-grade ore in the Peruvian mine. Mr. Wall was in town a few days since and is much pleased with his good prospect. Mr. Joseph Burwood has taken a lease on the Oxford and Geneva. He has already made a good shipment from the same, and has more ore on the dump ready for shipment. The Moltke mine is now working on lease by the old Alta pioneer, Baldy Fritz. He has taken out a good quantity of high grade ore. Our worthy citizen, Henry Wagner, Esq., the owner, was here and seemed to be much pleased with the mine. Judge James A. Varnes is still working the Albion on lease. He has taken a large quantity of high-grade ore, and has already made a big shipment, and will be ready in a few days to make another.

#### NEW MEXICO.

**THE MINES.**—*Socorro Bulletin*, Aug. 24: The Kelly mine is being operated with the usual good system, and is turning out several carloads of ore daily, which is shipped to this city and treated at the Billing works. For four years this property has been a constant producer, and in the deepest workings of the mine, which cannot now be less than 700 feet below the apex, its ore body displays increased quantities of that character of mineral which has placed this property in the same category with the first producing properties of this continent. The condition of this property establishes the value of the mines of the Magdalena district. The Graphic and the Greyhound mines, in the same district, are also being developed and exploited in a manner that does credit to their management, and affords daily mineral for treatment at the Graphic smelter of this city. The Greyhound is developing in a manner to astonish its owners, and both properties are making an output of mineral of better than ordinary quality from ore bodies which are steadily increasing in dimension. The Imperial mine, lying south of the Kelly, which was recently sold to Chicago parties for \$43,000, is awaiting the necessary machinery now on the way from the East, when the active exploitation and development of the property will commence in earnest. It is even rumored that a smelter, to be erected in this city, will be the next move made by the present owners. The Ruby gold excitement in Jordan Canyon gave a fresh impetus to mining in this county, and now not less than 20 claims in the vicinity of the gold strike are affording excellent ore. The Ruby mine has gone under new management, which is now working the property with a method that will insure its economical and successful development. The Jane Bowman gold mine in Water canyon shows up better than ever before, and the Ninevah Copper, in the same district, is awaiting hoisting machinery preparatory to continuous development. The concentrator near the Jane Bowman will commence operations in a short time. The Cooney or Silver Bar mine near Alma will be worked in a few days with an increased force, and the company owning it will erect a stamp mill and concentrator at once for the treatment of its ore. The Peacock or Miller mill, in the same district, has been working steadily, only stopping as necessity demanded for repairs, etc. The Sheridan Company mill is fast arriving at that stage where it will very largely augment the bullion production of this county. The Brittenstein mines and mill in the Pueblo district will, at no remote period, continue their bullion product to swell the production of the county. Several new plants are talked of, among them one for the Anchor mine. Not less than 200 mineral locations were made in this county within the past six weeks, and more than 400 miners are added to the population which inhabits our mountain ranges. Important strikes are reported weekly from Water canyon and the east slope of the Magdalenas, and ruby silver was discovered on the summit of the Magdalenas two weeks ago.

#### OREGON.

**GRANT CO. NOTES.**—*Bedrock Democrat*, Aug. 23: The new quartz find on Dixie creek is still showing up very well. They are not doing much at the Keystone now, except preparing for a big run after a while, but the rock that is being taken out is up to the usual standard. The Brackett & Lockwood ledge is being prospected, and so far is satisfactory. Yesterday some of the coal discoverers mentioned last week returned, after having partially prospected the ledge, which is about 16 feet wide on the surface. The discovery was made by John Garrison while out hunting. The coal burns quite well, and may, in time, be a valuable piece of property. Mr. Garrison wants to sell an interest to some man with capital so that he can develop it. Latest reports from the Big creek placer mines are very encouraging. Charley Dustin was over from Long creek during the week, and brought the news of recent discoveries. One man sunk a prospect hole, and before reaching bedrock he struck dirt which went three dollars to the pan. That country is composed of immense gravel deposits, and is liable to show something very rich. Laurance Starr & Co. are at work on a quartz lode in the Quartzburg district, which is from 80 to 100 feet wide. Assays from this mine are highly encouraging; they have been at work developing this ledge for some time. Shearer & Co. also have men at work on the same line north; Barrett & Co. on the same south. There are thousands of tons in sight. This is the mine for a large steam mill, plenty of timber on the claims. We are just beginning to find that Grant county is rich in gold and silver quartz,

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all  
 other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossi-  
 ble to make them tight except by regrinding, which is expensive if done by hand, and if done  
 by machine soon wears out the valve, and in most cases they have to be disconnected from  
 the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is  
 manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.  
 To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Fig. 14 is the same, looking from underneath. Fig. 15 is a plan of the check-valve, *g*, showing oil-holes and channel. Fig. 16 is a plan of the air-pump, showing the guide-bars, *k*, and the valve-seats.

Each of the four receding valves shown, *g*<sup>1</sup>, *g*<sup>2</sup>, *g*<sup>3</sup>, *g*<sup>4</sup>, has recesses or grooves, *j*, in the rim, into which guide-bars, *k*, enter, and on which the valves move up and down. The guide-bars are secured to the pump-barrel by screws. Each of the receding valves increases in diameter corresponding to the sections of the pump-barrel, as shown in Figs. 9, 10, 11, 12, and is provided with a rubber cap, *h*, which is attached to the valve by a screw, *i*. The cap is countersunk for the head of the screw, the shank of which is loose in the cap, by which means the cap rises to the pressure of the air and permits it to pass into the upper section of the pump. The check-valve, *g*, and the piston, *m*, are each provided with a like rubber cap, having similar action. The piston-rod is connected with the piston by a universal joint, *n*, which acts reciprocally to the motions of the buoy. For the purpose of lubricating the guide-bars, *k*, an oil-cup, *l*, placed on the top of the pump-barrel, supplies oil to holes, *q*, in the check-valve, through which it flows to the bars. In Fig. 1, the dotted lines, *z*<sup>1</sup>, show the movement of the buoy in imparting a full stroke to the pump. A full up-stroke will discharge the compressed air out of the pump, leaving the valves massed in the upper section; and on the down-stroke each valve will fall and seat in its proper section. The object of the sections in the pump-barrel is to store the air received from imperfect strokes of the piston caused by the irregular action of the waves; and, whether the stroke is short or long, the air received is stored in the sections until it is discharged into the air-chamber. The basin, *B*, to which the pumps are attached, imparts to the pumps the wave-power received from the buoy—the weight of the ballast in the basin being the equivalent of the pressure exerted on the pumps.

In adapting the wave motor for service as a signal, relief, or light station, a heavy iron framework, *Q*, is attached to the upper segment of the buoy, as shown in Figs. 1 and 4. In this framework there are arranged and secured a signal whistle, *U*, which is operated by compressed air conveyed by a pipe, *Z*<sup>1</sup>, from the reservoir, *E*; an electric light, *V*, and a bell, *W*; and at the top there is a step for a flagstaff. Extending from the top of the buoy to about the middle of the framework there is a cylindrical iron tower, *O*, having porthole lights and a door opening from the hurricane deck, *Z*. The tower is also entered from the inside of the buoy by a spiral stairway, *P*, for the purpose of arranging or repairing the electric lights, and for a lookout. Surrounding the buoy above the reservoir, *E*, there is a main deck, *X*, from which a companion-ladder extends to the hurricane deck.

The inventor is of the opinion that the wave motor may also be applied to a sailing vessel as an auxiliary means of propulsion. When employed as a signal, relief or light station the buoy would be 30, 60 or 90 feet in diameter. In every case where the station was unusually exposed to the action of high winds and the consequent rough water, the buoy would be provided with means for discharging oil overboard to smooth the surrounding water.

### Mining Share Market.

There has been little change on the Comstock this week. A fracture of the pump-rod of the Cornish pump in the Combination shaft was discovered on Thursday morning, near the upper end of the rod. Its working was stopped immediately, as in a pump-rod about 3000 feet long, made of 16-inch timbers, it will not do to wait for a break. The fractured section has accordingly been removed and a new one substituted, says the *Enterprise*. Meanwhile, owing to the bailing tanks being called into service at the shaft, hoisting of debris could not be done, consequently operations on the 3200-level were temporarily suspended. The hydraulic pump and the tanks kept their water reduced and confined to the sump, all of which shows the perfect efficiency of the pumping arrangements in this shaft in case of any possible emergency.

With regard to the proposed pumping out of the submerged lower levels of the Gold Hill mines, strong objection has existed. The Yellow Jacket Mining Company holds the key to the situation, and Colonel Bob Morrow holds the controlling interest of that mine. The shaft is 3000 feet in exact perpendicular depth, and has a splendid Cornish pump, which was taken from the shaft at the time of the flood. Colonel Bob Morrow is now stated to have given his consent to the arrangement. If so, there will be plenty of capital provided to carry the scheme through. Some of the principal mining men of the Comstock are now in San Francisco, engaged in trying to effect this important object, which it most certainly is to be hoped will prove a success. In case of pumping out the Yellow Jacket shaft, others would follow suit, and it is said that the Bullion Company would also assist by sinking their shaft deeper. This, however, is problematical, or a question for the future, as the sinking of that shaft to a corresponding depth with the 3100 level of the Chollar and Potosi, or the 3000 level of the Jacket, would involve sinking 700 or 800 feet deeper. Start the Yellow Jacket pump, however, and all other desired adjuncts and measures of assistance would be easily arranged.

### New York Metal Market.

Telegraphic advices dated Sept. 2d give the following New York prices:

BORAX—6 3/4 @ 7 1/4 c.  
BAR SILVER—92 3/4 per oz.  
COPPER—LAKE—\$10.25.  
IRON—No. 1, \$17 to \$18.00.  
LEAD—\$4.85 to \$4.95.  
QUICKSILVER—43 @ 43 1/4 c.

The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Firm and fairly active, spot closing 10.20c @ 10.30c. Transferable Notices (Lake) issued at 10.30; Transferable Notices (Chili Bars) issued at 1.39 1/2.

LEAD—Steady at \$4.75 @ 4.82 1/2 c spot; \$4.80 @ 4.85 futures. Transferable Notices issued at 4.77 1/2.  
TIN—Fully steady and decidedly brisker at \$21.75 @ 21.90. Transferable Notices issued at \$21.80.  
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$21.90 @ 22.25; Billiton Tin, \$22.00 @ 22.35; Banca Tin, \$21.15 @ 22.50; Baltimore Copper, \$9.25 @ 40; Orford Copper, \$9.35 @ 40.65; P. S. C. Copper, \$9.35 @ 40.65; Foreign Lead, \$4.85 @ 4.90; Foreign Spelter, \$4.70 @ 4.75.

### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Germany, Aug. 24, \$6154.96; Hanauer, 24, \$900; Crescent, 24, \$1400; Queen of the Hills, 24, \$1400; Nevada, 24, \$9150; Queen of the Hills, 25, \$2950; Nevada, 25, \$2970; Germany, 25, \$2983.38; Hanauer, 26, \$5970; Germany, 26, \$2952.94; Hanauer, 28, \$9030; Germany, 28, \$5680.64; Queen of the Hills, 28, \$5680. The last week's output in the mining market, Salt Lake City, was 31 cars bullion, 733.298 lbs.; 38 cars ore, 1,091,360 lbs; seven cars copper ore, 216,650 lbs.; total, 76 cars, 2,041,308 lbs.

### Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
GEO. McDOWELL—San Luis Obispo and Santa Clara Co's.  
FRANK W. SMITH—Utah and Colorado.  
M. S. PRIME—Alameda Co.  
A. S. LUCH—Nevada and Placer Co.'s.

## IRRIGATION.

### The Law of Water for Irrigation in Colorado.

By S. W. CARPENTER.

This book is intended to present in a clear and concise way the Colorado law of this very important subject at the present time, with all the latest decisions. It also contains many suggestions of the greatest value to those interested in securing and preserving water rights in Colorado.

The information will be found of great value to those who are interested in irrigation laws for California.

We append, by permission, a notice of the book from Hon. H. P. H. Bromwell, of Denver, a member of the State Constitutional Convention, and of the General Assembly at the time much of the legislation on the subject of irrigation was framed, and later referee in the establishment of priorities in Water District No. 3, Cache la Poudre river, and a well recognized authority in such matters.

DENVER, COLO., June 2, 1886.

S. W. CARPENTER, Esq.—Dear Sir: I have examined the digest and compilation entitled "The Law of Water for Irrigation in Colorado," which you have prepared, and beg leave to say that in my opinion it will prove to be of much use and value to the community. The work so much needed has been done by you remarkably well, considering the brevity necessary in preparing a book for the use of all parties interested in irrigation, as well as of members of the bar. Respectfully and truly,

H. P. H. BROMWELL.

Price, \$1.25. Post-paid.

FOR SALE BY

DEWEY & CO., 252 Market St., S. F.

### Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Knecht's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 252 Market St.

### Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdies, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

MERIT will tell; misfit spectacles will ruin your eyesight; judge by comparison. Muller's optical depot, 135 Montgomery St. x

## REGISTRATION

—FOR THE—

### General Election.

All electors desiring to vote at the General Election, to be held November 2, 1886, must be registered regardless of any previous registration.

Registration for the General Election to be held November 2, 1886, will commence at the office of the Registrar of Voters, in the basement of New City Hall, on WEDNESDAY, August 4th, and will continue until MONDAY, October 11th, inclusive. Office hours, 9 o'clock A. M. to 5 P. M.

By order of the Board of Election Commissioners.

P. F. WALSH, Registrar.

August 1, 1886.

### ASSESSMENT NOTICE.

Truckee Ice Company.—Location of principal place of business, San Francisco, California. Location of works, Martins Creek, near Truckee, Nevada county, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 1st day of September, 1886, an assessment (No. 1) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 202 Sansome Street, room 4, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 25th day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. W. SCOTT, Secretary.

OFFICE—No. 202 Sansome St., room 4, San Francisco, California.

### DIVIDEND NOTICE

OFFICE OF THE

Paradise Valley Mining Company  
San Francisco, California.

At a meeting of the Board of Directors of the above-named Company, held August 24, 1886, Dividend No. 8, of Twenty-five (25) Cents per share, was declared payable on Wednesday, the 25th of August, 1886, at the office of the Company.

W. LETTS OLIVER, Secretary.

OFFICE—No. 328 Montgomery St., San Francisco, Cal.

## LUBRICATION.

Our readers can procure of CHARLES J. WOODBURY Manufacturer of Oils, 123 California St., San Francisco, a fine Lard Engine Oil, unsurpassed by any other Oil for general use, and which will flow through any feeder at all temperatures. Also, Cylinder Oils, Refined Cylinder Tallow, Lubric Compound, Farm, Machine, and strictly pure Lard Oil. The Woodbury Oils are in use on the Central, Southern, and Northern Pacific Railways, and nearly every Railroad and Steamship line on the coast.

## A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest, and Most Valuable Handbooks of the Age. Indispensable to every practical man. Just Ready. Price, \$2.00, Free of Postage to any address in the world.

## THE Techno-Chemical Receipt Book:

Containing several thousand Receipts covering the Latest, Most Important, and Most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Elsner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling, with additions by William T. Brann, Graduate of the Royal Agricultural College of Eldena, Prussia, and William H. Wahl, Ph. D. (Held.), Secretary of the Franklin Institute, Philadelphia; author of "Galvanoplastic Manipulations," illustrated by 78 engravings. One volume, over 500 pages, 12mo., elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price, \$2.00, free of postage to any address in the world.

**ABSTRACT OF CONTENTS:** Adulterations, Imitations, etc. How to Detect Them; Alloys; Artificial Gems, Pearls, and Turkish Beads; Bitters, Cordials, Elixirs, Liqueurs, Ratafias, and Essences, Extracts, Tinctures, and Waters Used in their Manufacture, and the Manner of Coloring them; Blasting Compounds, Plastering Powder, Dynamite, Gun Cotton, Gunpowder, Nitro-Glycerine, Fulminates, etc.; Bleaching; Boiler Incrustations; Bone, Horn, and Ivory, to Bleach and Dye them, and make Imitations and Compositions; Bronzing and Coloring of Metals; Building Materials, Artificial Building Stone, Mortars, etc.; Cocoa and Chocolate; Celluloid, Caoutchouc, Gutta Percha, and Similar Compositions; Cements, Pastes and Putties; Chemical and Techno-Chemical Expedients, Preparations; Cleansing, Polishing, and Renovating Agents; Colored Chalks, Crayons, Pencils, and Inks for Marking Linen etc.; Confectionery; Copying and Printing; Damaskeening Steel; Decoration, Ornamentation, etc.; Dentifrices and Mouth Washes; Dyeing Woolen and Cotton Goods, and Yarns, Silk, Straw Hats, Felt Hats, Kid Gloves, Horsehair, etc.; Mordants; Electro-Plating, Galvanoplasty, Gilding, Nickeling, Silvering, Tinning, etc.; Enamels and Enameling; Feathers, Ostrich, Marabouts, etc., how to Wash, Restore and Dye; Fire-extinguishing Agents and Means of Making Tissues; Wood, etc. Incombustible; Fireworks; Food and Food Preparations; Freezing Mixtures; Fruit and other Syrups; Fuel and Heating, Heat Insulation (Non-conducting coverings); Fusible Colors used in Porcelain Painting; Glass, Composition of the various kinds of, Colors for, and Processes for Enameling, Engraving, Gilding, Silvering, Pulverizing, Filing, Bending, etc.; Glazes for Earthenware; Glass and other Signs; Glue, Manufacture of; Household and Rural Economy; Illuminating Materials; Imitations, Substitutes, etc.; Indigo, Indigotine, and Alizarine; Inks, Lithographic, Printing, and Writing; Jeweler's Polishes; Lacquers and Varnishes; Leather, Tanning and Dyeing, including Furs, etc.; Liquors and Beverages: Beer, Brandy, Gin, Whisky, Wines, etc.; Lubricants for Machines, Wagons, etc.; Marine Glue; Matches; Metal Industry; Mustards; Oils and Fats, Animal, Vegetable, and Mineral; Oil Paintings; How to Cleanse, Pack, and Varnish them, and to Restore Gilt Work; Paints and Pigments; Grinding and Mixing Colors, Graining, Imitation of Marbles. Paints and Washes for Various Purposes, etc.; Paper and Paper Materials, Manufacture, Staining, etc.; Glass, Sand and Emery Paper; Perfumery, Aromatic Vinegars, Cosmetics, Extracts, Hair Oils, Pomades, Powders, Washes, Fumigating Articles, etc.; Pharmaceutical preparations; Photography; Plaster of Paris Casts which can be Washed; Preserving Meat, Milk, Vegetables, Vegetable Substances, Wood, etc., and Preservatives; Sealing Wax and Wafers; Shoe-Blacking, Dressings, etc.; Sizing and Dressing for Cotton, Wool, Straw, etc.; Soap, Hard and Soft Soaps, Medicated and Toilet Soaps, etc.; Soldering and Solders; Sugars, Glucose, etc.; Textile Fabrics and Tissues; Tobacco, Smoking Tobacco, Snuff, Sternuative Powders, etc.; Vinegar, Manufacture of Ordinary and Fine Table Vinegars; Washing and Scouring, Manufacture of Washing Blue, etc.; Waste and Offal, Utilization of; Water-Glass (Soluble Glass) and its Uses; Water-proofing Compounds; Wax and Wax Preparations; Wood Gilding, Polishing, Staining, etc.; Yeasts, Manufacture of Pressed Yeasts, Bakers' and Brewers' Yeast, etc.; **Addenda.** Alloys; Antiseptic and Preservative Agents; Artificial Eyes, Manufacture of; Asbestos and its Uses; Bleaching; Bookbinding, Gilding, and Ornamenting; Bronzing; Gilding, Silvering, etc.; Building Materials, Celluloid, Imitations, Substitutes, etc.; Cement Work; Cleansing, Polishing, and Renovating Agents; Colors, Enamels, Cements, Glue, Varnishes, Water-proofing Substances, etc.; Copying; Explosive Agents; Glass; Horn Combs, Manufacture of; Lubricants, Blacking, etc.; Metal Industry; Miscellaneous; Oils and Fats; Paper; Straw, Bleaching and Dyeing of; Strength of Materials; Willow-Ware; Index.

A circular of 32 pages, showing the full Table of Contents of this important book, sent by mail free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO., Industrial Publishers, Booksellers & Importers, 810 Walnut Street, Philadelphia, Pennsylvania, U. S. A.

## ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself:

BUNKER HILL GOLD MINING CO.,  
AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,  
(signed) N. W. CROCKER, Supt.

Dewey & Co.'s Scientific Press  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HERCULES SLAYING THE GIANTS.

## HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

- No. 1 (XX) is the Strongest Explosive Known.**  
**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE

ARTIFICIAL STONE PAVING CO.  
(SCHILLINGER'S PATENT.)

SIDEWALKS, GARDEN WALKS, CORRIDORS, OFFICES, CARRIAGE  
DRIVES, STABLES and CELLAR FLOORS, KITCHENS, Etc.

The Courts here and in the East have decided that Artificial Stone Pavements with plastic concrete and in detached blocks, are infringements on the Schillinger Patent; and also, that when the plastic material is blocked off with a trowel and cut through far enough to control the cracking caused by shrinkage, that such pavement is in law the same as if laid in detached blocks, and is an infringement of the patent. All property-owners having such pavements laid without the license of the above Company, will be prosecuted.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

#### RANKIN, BRAYTON & CO., MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., of any DESIRED CAPACITY.

#### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

#### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## ADAMANTINE Shoes, Dies and Crusher Plates

ADAMANTINE.

We manufacture the above Adamantine Shoes, Dies and Crusher Plates. They are in use on the hardest quartz in the United States and South and Central America, and have been for the last ten years; we warrant them to outwear three (3) sets made of any other metal, and many report that they last from 4 to 8 times longer than any other make. They never break AT THE SHANK, and the wear is so light that little or no foreign matter gets mixed with the crushed ore.

Also CHROME CAST STEEL for Mining and General Use, of the finest quality.

For further particulars, address

#### CHROME STEEL WORKS,

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.**  
(\$575 00), F. O. B.

**OVER 1,000 ARE NOW IN USE.** Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

## Improved Pumping Engine.

During a recent visit to the Mechanics' Institute Industrial Exhibition, now being held here, our attention was directed to the Rider compression (hot air) pumping engine being there exhibited by the Joshua Hendy Machine Works, Nos. 39 to 51 Fremont street, this city, who are the agents for their sale in the Pacific States.

With reference to these engines we quote from a circular, which is freely distributed by that firm at the exhibition, and refer to the cut which appears on this page.

The importance of an abundant supply of pure water in every household cannot be over-estimated, statistics proving that a scarcity of water is a sure forerunner of zymotic diseases. The houses of farmers and country gentlemen being dependent upon wells for a water supply, the want of a simple and safe pumping engine which can be attended by an ordinary laborer has been greatly felt—hand pumping in large establishments being out of the question—the general resort was (until the introduction of the Rider) to the use of steam engines. This is objectionable on account of the expense and the necessity of employing skilled labor to insure safety.

The Rider engines meet this difficulty. New patterns, embodying all the improvements suggested by a long and varied experience, have been made, which now make the Rider the most valuable non explosive pumping machine extant.

All parts are interchangeable and made to a perfect system of steel gauges. They are adapted to every situation where it may be required to raise a supply of water ranging from 1000 to 50,000 gallons a day. The large number now in use throughout the United States, Europe and other parts of the world, and the high appreciation in which they are held, as well as the constantly increasing demand, attest their economy and superiority.

For the use of railroads, for filling water tanks, these engines, particularly the 10-inch size, have all the efficiency of a steam pump without the attendant care and expense necessary to the maintenance of steam.

For supplying French flats or apartment-houses, city and suburban residences, with water, they have proved to be the only machine which can be advantageously and successfully used, as they can be run by any household servant without risk of explosion, danger of fire, or extra cost of insurance. Reference is made to a large list of well-known gentlemen who have them successfully running in their residences, to convince any one of their perfect adaptation to this purpose.

For public buildings, hotels, colleges, universities and asylums; for breweries, tanneries, factories, sewing machine use, chemical works, operating printing establishments; stone quarries, brick-yards and nurseries; for supplying fountains and hydraulic elevators, furnishing water for sprinkling streets, etc., they are unequaled; while for purposes of irrigation, for dry lands, orange groves, vineyards, gardens, parks, lawns, etc., and for draining marshy places, pumping bilge water from vessels or basements of buildings, pumping water for cattle on stock farms, they are far superior to all other pumps in the essentials of safety, economy, simplicity and efficiency.

From a depth of 20 feet these engines will deliver as follows: 6-inch engines, 2500 gallons

per hour; 10-inch engines, 6000 gallons per hour. A 6-inch engine will consume five pounds of anthracite coal, and a 10-inch 10 pounds per hour. Bituminous coal, coke or wood, can be used equally as well.

Every engine is fitted with either Rider's patent rolling valve pump, or Rider's deep-well pump; both being of the best possible construction, brass-lined, double-acting, and capable of

## Quality of California Gold.

There is, of course, only one sure way to determine the fineness, and, consequently, the exact value, of gold, and that is by the process of assaying, after the melting of the dust into a bar or ingot. Even the knowledge of the region or gold-field from which a certain description of gold originated is not always a sure evidence of

mines in different counties in California, the State Mineralogist having investigated the subject. Still, as we have stated, it will not always do to rely on the supposition that because one mine produces fine gold another near by will do it also. The first attempt to collect statistics on this subject was made by A. P. Molitor, in 1859, and the data he collected was of value to gold buyers. Men buying dust in these days are more careful than formerly, and give enough less than the real value to always be sure. Gold is bought up in the mining towns and camps, mostly in small quantities, from miners at work in various directions around the camps. The large lots thus accumulated are melted and assayed, and then the true value ascertained.

## The Mote in their Neighbor's Eye!

Certain of the Eastern papers have of late been criticising the mining industries of California with some asperity, much stress being laid on the small returns realized on mining investments in this State. These journals, in support of their views, point to the fact that even the dividend-paying companies have disbursed not more than six per cent per annum on their nominal capital. Precisely so; but do not these journalists know that in most cases the nominal capital of these companies is many times greater than the amounts that have been actually paid in by the shareholders? As a general thing, it will be found to have been from three to five times as great, establishing that the net earnings of these companies are, in fact, very large.

What these papers have to say about the jobs that have been put up on those buying mining properties in this State, the gross misrepresentations that have so often been made, and the evils attendant on stock operations here, if not altogether timely, are just enough. They are things all deserving of the deepest condemnation. But why come so far to find and comment on abuses of this kind? Could not these, our critics, have found subject-matter for their caustic pens nearer home? A lecture on stock gambling comes with a good grace from a New York editor. Why, there is hardly one of these publicists but can, where he sits and writes, hear the orgies daily practiced in that veritable pandemonium, the Stock Exchange, on Wall street, where there is more financial ruin wrought in a single week than was ever accomplished here in an entire year, taking even the worst period of the Comstock craze.

Then, too, these guileless speculators in the East gamble in everything—in gas, water, railroad and mining shares; in coal and coal oil; in beef, pork, lard and live-stock; in wheat, flour, butter and all the other staples of subsistence, to say nothing of innumerable smaller things; whereas we on this coast have confined our gambling operations mostly to mining stocks, a business on this side now nearly extinct, being restricted to that class who make a precarious living by the practice of poker, euchre and other small games of chance.

WELSH GOLD MINES.—The following are some Welsh mines, in which gold has been found. The occurrence of this precious metal is hardly as remarkable as the names of the mines: Caegwian, Tyddingwladis, Dal-y-frwynog, Cwmheisian, Berthllwyd, Caerwernog, Llanfachreth and Mowddachtynyllwyn.

IMPROVED RIDER COMPRESSION PUMPING ENGINE.

working at any speed. When the water to be raised is not over 25 feet below the engine, a rolling valve pump is furnished, which is bolted to the side of the cooler and worked directly from the compression piston, and all the water is passed directly from the pump through the cooler on its way to the tank or outlet, making the most complete arrangement possible. In cases where the vertical distance to surface of water is more than 25 feet, the patent deep-well pump is furnished.

OVERLAND SHIPMENTS.—In July last the Southern Pacific R. R. Co. shipped East, from this city, 21,460 pounds of antimony, 248,940 pounds of borax, 42,800 pounds of copper cement, and 44,690 pounds of ores. From Oakland they shipped 146,080 pounds of borax; from Los Angeles, 64,710 pounds of borax; and from San Jose, 55,360 pounds of quicksilver.

its quality. In some camps, the gold from claims a mile or so apart varies materially. The writer has known \$19 gold to come from mines in a camp where other gold was worth only \$12 per ounce.

In judging of the quality of placer gold, no one can be sure that the gold taken out of one and the same flat, hill, or bar, or quartz lead will be always the same. Very often the most surprising difference in this regard is found within a comparatively short distance. Then there are quartz leads with very low gold, surrounded by placers famous for the fineness of their metal; on the other hand, there are veins with very rich metal in the vicinity of diggings where the gold is of low value. By beautiful appearances and seemingly very rich color, many an unlucky gold-dust dealer has come to grief.

A few months since we gave some examples of the value of gold from prominent

## Diamond Mining.

## Geological Occurrences in South Africa.

The diamond is found in South Africa under two distinct physical conditions—in old river alluvium, consisting “of a heavy deposit of ferruginous gravel mixed with red sand, lime and boulders” in a somewhat analogous manner to its mode of occurrence in New South Wales—when the places of exploration are known as “River Diggings;” secondly, as one of the constituents of a very abnormal agglomerate filling certain peculiar pipes or cavities, and restricted in their distribution to a comparatively small area. The latter are known under the name of “Dry Diggings.”

The river diggings were the first opened in the Cape Colony, along the course of the Vaal and Orange rivers. Good typical illustrations of this old river drift are exhibited by Messrs. Hill and Paddon from the Vaal River Diggings, consisting of pebbles of diorite or dolerite, jasper, agate, quartz and other minerals and rocks varying in size from that of a nut to that of a small lemon, accompanied by sands and other detrital matter. On the discovery, however, of the dry diggings, diamond alluvial mining was for all practical purposes abandoned. It is stated by Mr. Dunn that the diamonds from these drifts are of fine quality, and command a higher price than those from the dry diggings. The mode of occurrence at the dry diggings, both of this most valuable of all gems and its surrounding matrix or “the blue,” as it is known to the miners, has given rise to much scientific speculation, and many theories to account for it. The agglomerate or “blue,” which is nearly identical in appearance at all the mines wherever yet prospected, has been found to fill peculiar pipe-like or elliptical cavities extending vertically to an unknown depth. These so-called pipes are supposed by Messrs. Dunn, Maskelyne and others to have been filled by the violent ejection of volcanic matter in a state of ebullition, which on consolidation became the rock now known as the “blue.”

In the London *Mining Journal* is a series of articles on the “Mineral Exhibits at the Recent Exhibition,” describing them in detail. From these we compile the following: Before proceeding to a consideration of the intricate

## Subject of the “Blue,”

It may not be out of place, for a due appreciation of the question, to give a brief description of the strata in which the peculiar pipe-like cavities occur. The superficial deposits of the country consist of a red sandy soil, usually not more than a foot or two in depth, followed beneath by a layer of concretionary limestone, or, as it is sometimes described, a calcareous tufa. Next in descending order are shales, varying in color from gray or yellow to red, and known to geologists as the Karoo shales. They vary in thickness from 35 to 50 feet, and, according to Mr. Dunn, contain the remains of saurians. Underlying these is a series of black and carbonaceous shales, very combustible, and containing thin seams or lenticular deposits of coal, and are traceable in well sections all over the surrounding country at depths varying from 40 to 60 feet. This carbonaceous shale extends to a depth from the surface which fluctuates from about 260 to 290 feet, and both these and the overlying yellow shales are, Mr. T. Reunert says, roughly horizontal, although much disturbed. The only fossils yet found in these beds are fragmentary plant remains, which Messrs. Jacobs and Chatrain say are too indistinct for determination. In descending order we next meet with a hard and much-jointed basaltic rock, of unknown depth, which has been variously described as a dolerite, or an amygdaloidal dolerite, and contains a quantity of agate. It is the “hard rock” of the miners, and in all probability forms the bed-rock of the country, as it is visible in the course of the Vaal river, about 15 miles away, with an inclination, Mr. Schute informs us, of about 150 feet in that distance. Such is the constitution of the inclosing strata or “reef” of these remarkable pipe-like apertures at the diamond mines; but at both Kimberley and De Beer's the shales are overlain by a volcanic sheet, which is usually described as dolerite, but by Mr. Hudleston is called an olivine basalt. At the latter mine it is 100 feet thick; but as this rock covers a large expanse of country around, it may be considered, as Mr. Dunn has justly remarked, for all practical purposes, to surround the whole of the mines.

At Bultfontein and Du Toit's Pan the entire mine is still in the shale, the actual presence of the hard rock not having been proved, although it doubtless exists. It has been stated by several observers, Messrs. Dunn and Reunert among others, that the edges of the shales or “reef,” where they form the circumference of the so-called pipes, are upturned, as if by a thrusting-up action from below. This has been used as one of the arguments to prove the volcanic nature of the force which originally brought about the phenomena under discussion, but we are assured by Mr. Schute, who has had as many opportunities of observation as any one, that such a case has never presented itself to him; and neither is the least indication of it shown on the excellent plans made by Mr. W. Tucker, a sworn Government land surveyor at Kimberley. Furthermore, the edges of the reef at the circumference of the pipes do not, when freshly exposed, exhibit any of the phenomena which usually accompany intense vol-

canic action, but are, on the contrary, jagged and irregular.

## Within the So-called Pipes

The uppermost stratum underlying the calcareous tufa is of a more or less yellow color extending to a depth of 100 feet, and then insensibly passing into the more permanent “blue,” of which it is, in fact, only the upper or weathered portion, and like the latter, is diamondiferous. The “blue” extends to the greatest depths to which the mines have been explored, and is the genuine diamondiferous rock, unaltered by superficial agencies.

The fear entertained at one time that increased depth meant a decrease in production of the precious stones has been abundantly disproved. This was first found to be the case on passing from the “yellow” to the “blue.” At the same time there is no doubt a great difference exists in the relative richness of the “blue” in different parts of the ground at one and the same mine. Thus, at Du Toit's the ground was richer at two spots extending across the depression than at others, and at De Beer's, says Mr. Reunert, a “belt of rich claims spans the center of the mine from north to south, running out toward the northeast corner, where some of the richest ground was found.” This localization of rich ground also holds good at the Kimberley mine. There is not the slightest possible doubt now that with increased depth the supply of diamonds becomes larger, a fact which appears to hold good in all the mines. This is nowhere better illustrated than at De Beer's, for according to the sixth annual report of the directors for 1886, the ground at the 150-foot level was worth about one-half carat a load (two-thirds of a ton); but now at the 350-foot level, at the west end of the mine, the average value per load has increased to over one carat. With the view of

## Practically Testing the Value of the Blue

Toward the deep, the De Beer's Company took 10,080 loads from their underground galleries in the center of the mine, and at a depth of 380 feet from the surface. This ground when hauled was kept entirely separate from any other, and washed alone, with the very satisfactory result of yielding a total of 16,048 carats of diamonds. At De Beer's the blue ground below the large mass of “floating reef” in the United Company's claim at the south side of the general mine and near the edge of the pipe yielded during 18 months' work at the rate of one and one-half carats to the load, and this at least 150 feet below the level of the hard rock. Not only is this increase of value with depth noticeable at the sides, but Mr. Schute says also in the center of the mine. This increase of richness with depth has also been corroborated by results obtained from the 500-foot shaft at Du Toit's, for Mr. Reunert says that “the finds from this level are said to be much more satisfactory than nearer the surface.” There appears to be some indefinable kind of connection between the relative richness of the blue ground and the presence of masses of this “floating reef”—i. e., portions of the country rock or “reef” which have become entangled in the larger expanse of blue ground. It has been stated by Prof. N. S. Maskelyne that diamonds are again more plentiful near diorite dikes which were supposed to intersect the blue, but from the observations of Mr. Dunn it would appear that these so-called dikes are scarcely entitled to that name, as the rock of which they are composed differs from the blue only in being fine-grained and crystalline. For our own part we have not seen any rock from within the area of the blue which could be considered as a true dike stone *in situ*.

In concluding this portion of our remarks it may not be out of place to mention that the yield of diamonds at Kimberley from 1871 to the end of 1885, inclusive, has probably exceeded the enormous amount of 17½ million carats, or three and one-half tons weight; in value about 20,000,000*l.* The produce of De Beer's between the same period “is not much under 9,000,000*l.*, representing about one and one-half tons weight of precious stones.” Bultfontein since the opening of the mine has yielded 5,000,000*l.* worth of diamonds, and Du Toit's Pan 5,800,000*l.* during the same period.

## The supposed

## Origin of these Peculiar Openings

Cannot be better stated than in the words of Mr. T. Reunert: “The generally-accepted theory is that the ‘pipe’ is the funnel of an extinct volcano, and that the diamond-bearing rock, which now fills it and forms the mine, has been upheaved from a vast depth, the diamonds themselves being of earlier date than the upheaval.” With that part of this theory which likens the pipe to a volcanic funnel, and ascribes the origin of the blue to an ordinary volcanic outburst, we cannot for a moment agree. The want of any crater-like outline at the present surface has been attributed by Mr. J. Dunn to the immense amount of denudation which this part of South Africa appears to have undergone. This supposition of Mr. Dunn's would undoubtedly hold good provided it could be shown that volcanic action, as we now understand it, was the motive power and producer. The evidence, however, hitherto adduced to support this theory is of the weakest. So far as we are aware, the drifts of the neighborhood have not yielded any trace of either scoriae, ashes or basaltic lava such as usually accompany volcanic outbursts. On the other hand, diamonds resulting from the denudation of the blue ground, as Prof. Cohen believes, are met

with in local drifts, and there is no reason, therefore, why the products of a volcanic eruption should not also, had they existed. Whatever disturbances of this nature took place were at too remote a period to leave traces of their existence other than as the superimposed dolerite sheet at De Beer's or the lower-seated “hard rock.” Neither does the former appear to have any connection with the inclosing material of the pipes beyond the fact that, in common with the shales and hard rock, it forms the inclosing medium, and is to some extent, Mr. Dunn states, one of the constituents of the “blue.” There is no evidence to show that the sides of the “pipes,” where they have been exposed up to the present time, display the slightest trace of subjection to any extreme degree of heat. Nor does the “blue” present the appearance either of a substance which has been in a state of igneous fluidity or the product of a volcanic eruption, or, as Mr. Hudleston very justly remarked, submitted to any great degree of heat. Although we are in accord with this gentleman in believing that the mass of blue ground “once flowed,” we, for our part, are inclined to consider the movement more that of a semi-plastic mass rather than one having the amount of fluidity his remark would imply. Certain it is that the blue is not a lava, nor is it scoriae, nor yet a volcanic ash; but, on the contrary, a rock in the formation of which water has played a very important part. Another fact which would strongly detract from a volcanic origin is the remarkable mixture of which it consists, no less than 80 different rocks and minerals—in fact, “a catalogue of all it contains would fill a page.”

So far as our information goes, it is only at Kimberley that the “hard rock” has been found to encircle the whole mine, and for all we know to the contrary some of these “pipes” may be connected. This point has already struck Mr. Hudleston, who states “that Kimberley is in alignment with De Beer's, and perhaps connected underground.”

Dismissing the volcanic theory as untenable, it simply remains to inquire what

## Other Theories Have Been Advanced

To account for their peculiar phenomena. It has been suggested, first by Prof. Cohen, afterward by Stanislas Meunier, and subsequently by Hudleston, that water, either at a high temperature or only warm, acting under enormous pressure, was the principal factor in the production of the “blue ground,” or, in other words, that the action was hydrothermal. Meunier, however, does not apparently recognize that a high temperature was necessary, though, as in the well-known *alluvions verticales*, the water coming from a great depth may have been warm. We believe that the views of these savants will cover the accepted facts and meet all the objections which have been advanced against a purely volcanic origin.

The cause and effect, although differing to some extent from the action and products of mud volcanoes, induces us to believe that it is in this direction a comparison should be sought. In fact, it appears that this impression has also struck Messrs. Cohen, Meunier and Hudleston, although the latter seems to be the only one who has so stated. Cohen's first impressions were that the pans were the centers of tuff eruptions, the materials of which consisted, for the most part, of the older and underlying crystalline rocks.

It may, perhaps, be that the “blue,” when in a semi-plastic state, oscillated upward and downward many times before assuming a solid condition. In this way the existence of carbonized wood and fossiliferous shale would be accounted for, for we think it highly probable that a proportion of the upper parts of the blue ground was recruited by material from above during the churning and mixing which this strange agglomeration has undergone.

**INTERESTING FOSSILS.**—Well-diggers employed by Adolph Sutro, at the San Miguel tract, just south of Golden Gate park, recently found at a depth of 30 feet, imbedded in the solid clay, several pieces of well-preserved cedar and some large bones that resembled those of the mastodon. The fossils were preserved as curiosities. Thursday last, while sinking another well there, they, at a depth of 22 feet, found a piece of what was evidently a gigantic thigh bone of a giant mammoth. This was also in the clay, and what is an odd feature, and indicates that they may have lain there for centuries, is the fact that clean sand, to the depth of many feet, and other more solid debris, lie above. The bones were found on the high mountain, sometimes called Sweeney's point, which is 800 feet above the level of the sea. These fossils have been taken in charge by Mr. Sutro, at Sutro Heights, where they are open to the inspection of scientists.—*S. F. Bulletin, Aug. 30.*

**THE Little Sulphur Lime Works**, five miles northeast of Geyserville, are coming into noticeable prominence. This is a new enterprise, A. H. Ingham being the originator and proprietor. Not long ago Mr. Ingham discovered a ledge of lime rock, and after experimenting with it he concluded that he would put it on the market. A warehouse has been built at Geyserville, and the business of selling the lime is conducted there.

**SOUTHERN CALIFORNIA** is to be topographically surveyed with the view of reporting upon a site for a base line and for connecting it with the coast survey triangulations of the region.

## American Tin.

In a very short time a new American industry will, says the New York *Ironmonger*, be born, and American tin will make its bow to the commercial world and begin a vigorous competition with the foreign article. Almost three years have passed since the first deposit was discovered in Pennington county, Dakota, among the Black Hills. To-day the Harney Peak Tin Mining and Milling Co. has almost ready for operation a mill run by a 200 horse power engine, capable of reducing in its powerful embrace 200 tons of tin ore daily, and 100,000 tons of that ore has been opened up and is now awaiting the ordeal. A specimen pig, said to be the first ever made in the United States for strictly commercial purposes, has been placed on exhibition at the Metal Exchange; and at the New York Metallurgical Works, on Washington street, may be seen a monster specimen of the ore weighing 9000 pounds, which is destined to astonish John Bull in his own balliwick. This specimen was blown out of a mass of ore taken from a tunnel in the Etta mine, on Tin mountain, that was estimated to weigh 20 tons. How rich the deposit is may be judged from the fact that the treatment in the metallurgical works of five tons of average ore from the Etta mine resulted in the production of 51 pounds of metallic tin to the ton—a considerably higher percentage than is shown by any mine in Cornwall. Moreover, it is said that the deeper the workings go the greater is the percentage of metallic tin to the ton. Nor is the Etta group of two lodes the only source of supply owned by the Harney Peak Co.; 13 miles away is the Hill City group, comprising 43 lode claims containing true fissure veins of unusually rich tin ore. Here a small mountain of mine ore is piled on the dumps awaiting the completion of the mills. What is to be the future of this industry? The United States imports \$8,000,000 worth of tin yearly, and the consumption is increasing as fast as new uses for the metal are being found. The mines of the Old World are nearing exhaustion, and the new supply must be American. The richness of the deposits and the peculiar natural advantages in the matter of water and facility of transportation about the district reduce the cost of production to ridiculously low figures—the estimate being \$1 per ton for mining ore and \$1 per ton for milling it. With all these advantages for facilitating a large output, the promoters believe that the market cannot be materially affected for five years to come. In the meantime it is proposed to still further invade the English domain and enlarge the American field by the manufacture of tin plates, and a syndicate of prominent Pittsburgh iron men—after a thorough investigation into the causes that made earlier attempts unsuccessful—are preparing to make tin plate from the Harney Peak product so intrinsically superior that the English article will be unable to compete with it.

## The Mines of Valparaiso.

Acting Vice-consul Stahmer, in his report to Lord Rosebery on the trade and commerce of Caldera for 1885, writes: “The principal occupation of the people inland was, and probably always will remain, the working of mines of copper, silver, gold, cobalt, etc., although the price of the first two metals has fallen continually during the latter years that many mines are not remunerative, and others had to be abandoned for the time. Formerly scarcely any capitals were kept out of the often fabulous proceeds of the mines, so that the absence of reserve funds put a stop to working in adverse times; but lately some more foresight has been observed, and mines which yield are at least put upon a good footing of working cheaper by the aid of extensive machinery. Also, fresh capital is invested in mining, and establishments for the elaboration of ores. Thus the year 1885 has added three valuable enterprises, of which two are giving large profits to their owners, while the third has recently been concluded to commence work very soon. Same refer to the gold mines and connected amalgamation works of Cachiuyo, Puquios (85 miles from Caldera); the Bordes silver mines (about 80 miles distant on a different branch of the railroad line), which give work to about 1200 men and women; and the copper concentrating works at Lantaro, San Antonio (90 miles from the sea). The latter dispose of sufficient water for the washing of ores and for their extensive crushing machinery, and are expected to turn out over 3000 tons of ore per month. The old and famous Chanarcillo mines have also drawn again upon themselves the attention of miners and capitalists, as various discoveries, principally that in the Manto Ossa mine, produced good and plenty of silver ore. The amalgamation works have again sufficient to attend to, and commerce in general has been revived considerably, steamers passing north from Valparaiso bringing large quantities of provisions, merchandise, ingredients for the extraction of metals, machinery, etc.; while sailing vessels arrive with coal (British, Australian, and Chilean), coke, rocksalt from Peru, and timber from California and the south of Chili. There is no bulky article of exportation for sailing vessels, since the shipping of borate of lime, owing to low quotations in Europe, has been stopped.

## American Tools in England.

## Quite a Suggestive Discussion.

A very suggestive discussion took place some time since in Sheffield, England, in regard to the comparative merits and salableness of American over English saws and some other tools in Great Britain and Ireland. Mr. George H. Page, of Belfast, in a communication to the *Sheffield Daily Independent*, expressed the highest admiration for American-made saws, in particular, and also included in his preference many other tools. He said that when Irish and English mechanics—carpenters, joiners, coopers, plasterers, bricklayers, stonemasons and others—were offered a choice in the purchase of their tools, they almost invariably chose those of American make rather than English. Mr. Page asserted, moreover, that there was abundant ground for the preference. He writes that he once challenged a Sheffield traveler to produce a hand-saw equal to one of American make which was then selling in Ireland, and which he submitted to the traveler. After two months, Mr. Page says, the traveler sent one which was "wanting in all the properties of a good instrument."

Messrs. Crownshaw, Chapman & Co., of the Iron Saw Works of Sheffield, who undertook the defense of the English manufacturers, admitted that the English sometimes made inferior tools for special markets, but held that they could and did turn out saws, especially, equal to the best American make. This firm "absolutely and totally" denied that English mechanics prefer American to English saws; but, "as to the Irish," they admit with great sorrow that there is "a great deal of truth in it." The firm's personal experience is, they say, that they have "nothing whatever to fear from American competition when patriotism, as we suppose the Irish call it, and high tariffs, do not stand in the way."

## A Flaw in the Logic.

While this Sheffield firm "absolutely and totally" denied that English mechanics show the preference for United States tools, which they admit exists in Ireland, they yet publicly tell Mr. Page that they "can take him to places in England where goods are packed up in American style and sold as American, although entirely manufactured in England."

Why should an English manufacturer do this, unless it was because he could not sell them as English goods? Mr. Page further says: "We could point out even where a certain article of English make was offered to the trade at a certain price and not a single order was taken. The manufacturer took off his name, put it up in the American fashion, and offered it again as American, and sold, and is selling, large quantities; and what is really astonishing, at a considerably higher price than what he offered it for as of English manufacture."

## Ditto in the Colonies.

The above facts are collated from the English correspondent of the *American Manufacturer*, who adds: "I had got thus far in my letter when I learnt that quite another Sheffield manufacturer had received a letter from his son, who is stationed in Sydney, which contains the following interesting items: 'Foreign competition is playing—well, we won't say what—with the English colonial trade. English agricultural implements, axes, shovels, forks, picks, hoes etc., ain't in it with the Americans. Our people are importing American chisels and scissors, and they sell quite as readily as home-made.'"

## Further Confirmation and More Discussion.

The correspondent above alluded to says that Sir John Brown, an eminent English authority, said, in a recent public address: "I remember I was reproved 12 months ago for having hinted that some Sheffield houses were not producing good articles, and it was assumed that I had condemned Sheffield. I repeat the same thing now. There are houses in Sheffield who do not give sufficient attention to the quality of their wares. It is more than ever essential when you have such strong competition all round you, that you should produce a good article and that the article should be produced as cheaply as possible."

## United States Competition with England.

Sir John laments the loss of custom. Fifty years ago, he reminded his hearers, the population of the world took their supplies almost entirely from Great Britain. All this he showed was now changed. Sir John ventured the very pretentious observation that "America now is a very large manufacturing place. We used to send seven-eighths of the articles there; and to France and Germany we sent nearly everything. It was the same with Russia and our own colonies. Now we are almost dependent upon our colonies for such trade."

## Sir John's Two Remedies—Free Trade.

One of the remedies, he said, would be a grand federation of all English-speaking people in the world. The other would seem to be an abandonment of what he says is altogether misdominated free trade. So federated England would then be master of the position.

As to the second remedy, Sir John observed: "It is all very well for England to call herself a free-trade country; but how can she really be so when we have duties upon some 21 or 22

articles, representing something like nineteen millions of money? Yet with all this, we are weak enough, foolish enough, to stand up and say that we are a free-trade nation."

## What Sir John Would Do.

"I say banish your custom-house and your tariffs, and then call yourself a free-trade nation, but do not let us carry a flag that does not belong to us."

## England to Set Her House in Order.

"Then let us try what we can do to set our house in order, and insist on the Government making a thorough searching inquiry into the effect of free trade, whether it has served us, or whether it is equal to serving us now."

## Free Trade or "Sham Trade?"

"I ask that there shall be a thorough inquiry into the system so that it may be proved whether we have flourished under the system of free trade, which I call sham trade, for it is neither free nor fair trade." He further stated that the working people are also unhappy. Certain of their conspicuous leaders are likewise repudiating free trade; they, too, demand an inquiry. Meanwhile they would complicate matters by reducing the hours of labor. At Liverpool and at Edinburgh, trades councils have passed resolutions advocating eight hours as a day's work, and desiring that the scheme should be thoroughly discussed also by the working classes the kingdom over. For they, too, like Sir John Brown, have generally arrived at the conclusion that the world's current production is largely in excess of the world's current needs.

## Nevada County Mines.

## A General Sketch of a Rich Region.

Nevada county is the chief of all the mining counties of the State of California. It has a middle situation in the State, but is generally ranked as a northern county. The summit of the Sierra Nevada runs through the county, the towns of Truckee and Boca being east of those mountains and within Nevada county. The *Foothill Tidings* says:

The chief industry is mining, although farming is carried on with profit in the western part of Nevada county. No equal area in the world has produced more gold than has Nevada county, and no region known has the promise of an equal mining permanency. The gold is found in both quartz ledges and gravel beds. Nevada and Grass Valley townships are the principal portions in which quartz mining is carried on. Eureka and Washington townships, farther east and higher of altitude than the two first named, have also many valuable quartz ledges. The mines in Grass Valley and Nevada townships have been systematically worked and developed for many years; those of Washington and Eureka townships are now receiving the proper kind of attention. Some good quartz gold mines have been developed in Washington township within the last two years. In Eureka township, near Graniteville (Eureka South), several mines have paid well for a depth of from 100 to 200 feet, and then these mines were allowed to stop. Some of these properties are now being worked again. Meadow Lake has also many quartz ledges, which, in former times, attracted so much attention that a city was built in almost a day near the very summit of the Sierra Nevada. The Meadow Lake mines are idle now, and time alone will tell if the ledges there have gold sufficient to cause mines to be made. Rough and Ready township has many gold-bearing quartz ledges in its eastern portion, while in the western part are valuable deposits of copper.

The great gold gravel region of the county is in the townships of Bridgeport, Bloomfield, Eureka, Little York and Washington. These are of immense extent, and of incalculable richness. These beds were worked by the hydraulic process for the most part, and enormous values of gold were washed out of them. The hydraulic process of working mines is now under the ban of the law, but doubtless a way will be found for lawfully taking the gold from those rich gravel beds. There are some gravel mines in Nevada, Grass Valley, and Rough and Ready townships, but they are not extensive—excepting at Mooney Flat in Rough and Ready, where is the extension of the famous gravel leads of Timbuctoo, Smartsville and Sucker Flat.

The most famous of the present active quartz mines are the Providence and the Wyoming, of Nevada City district, and the Idaho, Empire, North Star and Crown Point, of Grass Valley district. One of them, the Idaho, on the first Monday in June, 1886, paid its two-hundredth dividend to its stockholders, the dividends having been monthly, and only about four skipped months occurring during the history of the mine, and then when "dead-work" was being done. The Crown Point may be called a new mine, although it was long ago located and a little worked under the name of William Penn. It is situated between the town of Grass Valley and the Idaho mine. The Crown Point is a coming mine. The Empire is the oldest working mine in the State, and has taken out millions of dollars' worth of gold and promises an indefinite continuance. The Allison Ranch mine, about four miles down the Wolf creek from the town of Grass Valley, has been idle

for some years, after having had from four to five million of dollars taken out of it, with a working of only 200 or 300 feet in depth. Arrangements are pending for the starting up of the famous old Allison Ranch mine, where cabbages grew on top of the rich ledge way back in 1851.

Water-power for running machinery has been partially introduced into Grass Valley district, and the water system will soon be extended pretty much throughout the district. This cheapness of power for pumping mines, hoisting ores and running stamping mills insures the profitable working of many quartz ledges now idle. Working the mines gives a home market, with the top prices, to the farmers and fruit-raisers of the vicinity.

## Win a Front Seat in Life.

Here is something from the pen of a Boston teacher of metaphysics that is worth reading, and remembering, too:

Make up your mind that you will have a front seat in life, and you attract to you the powers that carry you to the front seat. If (in mind) you take the back seat, you get only the back seat. The confident, determined mood of mind, steadily kept up, brings to you other confident people. Confidence in the business world means both cash and credit. There is not half money enough in this country for doing its daily business. What is lacking in coin and bank notes is made up by men's names written on bits of paper promising to pay certain sums in a certain time.

## Don't be a Screw.

What keeps thousands of noses on the grindstone of hard times is that they have no confidence or courage in themselves to take risks or responsibilities. They keep a poorhouse in their minds and live in it. They aspire to be only a screw in the business machine instead of striking out and making a machine of their own. The screws are book-keepers, telegraph operators, clerks, and all who never plan anything beyond a situation and steady wages. Confidence and brains combined find such screws ready-made by the thousand. It makes the screw do as much work for as little money as possible. When one screw is worn out it throws it aside and gets another.

The screws find fault with the monopolist. Their real slavery is in their own minds. They never think, aspire, plan or demand in thought to be anything but screws. They think there is no place for them at the head of a business. Their first and great step toward staying permanently at the tail of a business lies in thinking that they must remain at the tail. Because what is assumed or kept steadily in thought always frames an outward exact like of itself in what can be seen. If you think clean clothes you will always have clean clothes.

## Always Aim High.

A workingman ought never to look at a millionaire's palace without saying: "I am going to have a palace like that." His saying this in dead earnest is one thought among many others which pushes him toward and into his own palace. Because it is your thought that pushes you to do things. If you are in the apple trade, and a thought suddenly comes to you that you can sell a hundred barrels of apples at a certain place, you can't stay away from that place. The idea will push you on.

## Well-directed Industry.

Real business does not lie alone in being industrious. The goody-goody books and maxims have only told half the story about industry. A great deal depends on what you are industrious about. If you spend all your time and strength in polishing tin pans or blacking your boots your industry won't carry you very high. The industrious mind in a rested body plans in an hour what brings in more money than a tin-pan polisher may earn in a year. People who work only or mostly with their bodies have as good a right as the capitalist to work with their minds. The world always wants newer things, more curious things, more improved things, more amusing things. No workman in any trade, any art, any profession, should be content with doing what some one has done before him, even though he does it well. He should aim at doing something better than any one has done before him. When he can do this he must next push it on the world's notice.

## Push.

Push is a talent as much as skill in any art. You can commence pushing by imagining yourself a pusher. Keep yourself before yourself in your mind as a pusher, and such frame of mind will at length make you push. There is a power in a continual imagination of yourself in any certain character which does make you more and more like such character. Imagine that the best belongs to you and will find the best coming to you. Imagine the worst, see yourself in the poorhouse, and the poorhouse comes to you. Success, like charity, must commence at home in the mind. If now you are compelled to live in a poor room and on poor fare, do so only under protest. Keep your mind on the better room and the better fare. Don't say, "I s'pose I must always take up with this." Say instead, "I am going to have better things than these." You are then creating for yourself strength instead of weakness. You are then ever strengthening this inexplicable mental attraction which will bring these things to you.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRACE AND WHIFFLETREE GUARD.—E. E. Stephenson and L. A. Lasher, S. F. No. 347,899. Dated Aug. 24, 1886. The guard consists of a cup-shaped shoe or cap, within which the end of the whiffletree, the connecting links, and the end of the trace are inclosed. The outer surface of the guard is rounded and smooth, so that it forms a direct continuation of the trace, and thus prevents any injury to the trees or vines when it is applied to cultivators or other agricultural implements to be used in orchards or vineyards.

CAR-COUPLING.—John H. Buster, Spenceville, Cal. No. 347,919. Dated Aug. 24, 1886. This invention is of that class of car-couplings in which a spring actuated latch, pivoted in the drawhead, is forced back by the incoming link and springs down again to engage it. The object of the invention is to provide a coupling, automatic in its action, thus obviating the necessity of passing between the cars, the fruitful cause of so many accidents. The coupling consists in the novel and simple arrangement of the latch, the means for releasing it from the top of the car, and the means for holding it back when desired.

ORE CONCENTRATOR.—William A. Woods and Charles C. Garcelon, Santa Cruz, Cal. No. 347,909. Dated Aug. 24, 1886. This machine is adapted for concentrating by either the dry or wet process. It comprises a main frame, a suspended frame, means for eccentrically shaking the latter frame, pans with distributing plates, discharge spouts under the pans, a hopper above them, the pans, spouts and hopper all being carried by the shaking frame, a feed chute above the hopper, means for longitudinally reciprocating the feed chute, and other details of construction. In the shaking pans the concentrations remain near the outer rims, while the worthless particles work upwardly and are discharged centrally.

RELIEF VALVE.—James O. Rusby, Chico, Cal. No. 347,892. Dated Aug. 24, 1886. The object of this valve is to prevent hose from bursting when the nozzle is closed or when there is any obstruction to the stream. It consists in a short section of pipe, provided with means at each end for readily coupling it to the sections of hose at any portion, said pipe having formed on each side a hollow lug in which is made a valve seat, the lug itself communicating with the interior of the pipe. Spring actuated valves are seated in lugs on each side of the pipe and control the ports of the hollow lugs. The valves accommodate themselves to the pressure and relieve it only to the extent desired, so that the hose will not burst.

GATE.—Samuel Stephens, Central House, Cal. No. 347,898. Dated Aug. 24, 1886. This is a new and simple form of those gates which are usually termed "automatic," and are operated by the traveler without putting him to the necessity of alighting from his conveyance. The principal points of novelty lie in the manner of hinging the gate so that it will not sag; the means for releasing the latch, and the means for swinging the gate. The first of these features consists in simply making the hinge-rods longer than usual and attaching them at or near the vertical center plane of the gate. The latch releasing and the turning of the gate are accomplished through cords and levers, one of the latter being a spring lever, the intervention of which simplifies the construction of the entire system and effects in the easiest manner the double result intended.

ADVERTISING OPTICAL APPARATUS.—Augustin Duboce, S. F. No. 347,926. Dated Aug. 24, 1886. The inventor has christened this device by the very appropriate name of "Ondulescope." This title is applicable, because of the effect produced, there appearing a succession of waves or undulations, sometimes parallel, sometimes radial and divergent, and sometimes converging to a center or central line, giving an effect at once fascinating and indescribable, and resembling the softly-undulating surface of a gently-agitated lake. The whole effect is produced by a design of any character, moving behind a transparent or semi-transparent sheet, such as glass, the surface of which is corrugated, broken or uneven. There are many ways in which to effect the movement of the design strip, and many different ways in which to heighten the effect by reflecting surfaces; but in all, the general result is the same. The apparatus can be used for entertainment or for advertising purposes.

THE STATE GOVERNMENT.—We are indebted to the courtesy of Hon. Thos. L. Thompson, Secretary of State, for a copy of the pamphlet compiled by him and entitled "Governmental Roster, 1885-6, State and County Governments of California—Executive, Judicial and Legislative Departments." The work includes in its 150 pages the secretary's report for the two years ending June 30th last, lists of the various officials and tables of election returns, and is indexed in so thorough a manner as to make it very handy and valuable for reference.

## TABLE OF CONTENTS.

ILLUSTRATIONS.—Improved Rider Compression Pumping Engine, 165. Slag and Matte-Pot with Sectional Bottom, 168.

EDITORIALS.—Improved Pumping Engine; Quality of California Gold; The Mote in their Neighbor's Eye, 165. Passing Events; Lead Mining in Brazil; Cause of Earthquakes, 168. Sectional Slag and Matte-Pot; Reduction of Ferrie Solution; Coal Mining Abroad; A Sensitive Mining Lamp; Blowing Whistles Without Steam, 169.

MISCELLANEOUS.—Diamond Mining; American Tin; The Mines of Valparaiso, 168. American Tools in England; Nevada County Mines; Win a Front Seat in Life; Notices of Recent Patents, 167. A New System of Preserving Food, 171.

MECHANICAL PROGRESS.—Working and Tempering Steel; Cylinder Condensation; Rapid Adoption of Steel Railway Sleepers; Sheet Iron in Construction; New Process for Making Steel Pipe; Improved Barbed Wire Fence, 170.

SCIENTIFIC PROGRESS.—Salt-water Ice; Polarity in Tadpoles; Scientific Survey of Southern California; Photographing Cannon Balls; An Electric Mining Locomotive; Sugar and Sweets; Sea-serpents; Sun Spots and the Wheat Product; Ignatite, 170.

USEFUL INFORMATION.—A Lubricant for Brass; A European Street Car Rail; Alloy of Aluminum and Tin; Danger from Electric Lights; Carriages in China; Utilizing Escaping Gas, 171.

GOOD HEALTH.—Sunstrokes in California; Fatal Effects of Alcohol; Salubrity of our California Climate; Variety in Food; Successful Treatment of Sciatica by Massage; Fatality in Mining, 171.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 172-73.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 176.

## Passing Events.

The great earthquake in the East still continues a topic of conversation, and several shocks have occurred since the first disastrous one. In another column we give the views of a distinguished geologist on the subject of the causes of earthquakes.

The great yacht race between American and English types of vessels, at New York, is attracting the attention of designers and the people generally. As was the case in the last international race, the American yacht won the first of the series of races. If Americans have no navy to be proud of, they can congratulate themselves that designers of vessels are not idle, but have been able to build vessels to beat the fleetest of the English craft.

Silver mines continue to shut down on account of the low price of silver. In some places the owners of mines are reducing wages in preference to closing down; but the miners are dissatisfied with this.

Thursday, September 9th, being the birthday of the State of California, was a legal holiday, during which business was generally suspended.

NEW CARS.—The Central Pacific Railroad Company are constructing at the Sacramento shop 200 new and improved fruit cars, in season for the next fruit crop. These cars will carry 25 tons, and are about 30 feet long, of heavy construction and special adaptation to the work. The bearings will be seven inches long and four inches diameter, an increase on all similar cars.

## Lead.

There is so much lead mining going on everywhere on this coast that everything concerning that metal will interest the miners who are working on it. We have compiled a few facts concerning the metal which may be useful for reference.

In order to compute the weight of lead the following rule is useful: Ascertain the number of cubic inches in the piece; multiply the sum by .41015 and the product will give the weight in pounds. For example: What is the weight of a leaden pipe 12 feet long and 3.75 inches in diameter. By rule in mensuration of surfaces, to ascertain the area of cylindrical rings:

$$\text{Area of } (3.75 \times 1 \times 1) = 25.967$$

$$\text{Area of } 3.75 \times = 11.044$$

$$\text{Difference, } 14.923 \text{ or area of ring.}$$

$$144 = 12 \text{ feet.}$$

$$2148.912 \times .41015 = 881.876 \text{ lbs.}$$

In this rule the weight of a cubic inch is given as .41015, as for ordinary metal; when, however, the specific gravity of the metal under consideration is accurately known, the weight of a cubic inch of it should be substituted for the unit (.41015) here given. Cast lead has a specific gravity of .11352, and a cubic inch of it weighs .4106; rolled lead has a specific gravity of .11388, and a cubic inch weighs .4119. According to the lead under consideration, these units should be used to compute weight under the rule we have given.

The weight of a square foot of lead from 1-16 to one inch in thickness is given in the following table:

Thickness.	Lbs.	Thickness.	Lbs.
One-sixteenth.....	3.691	Nine-sixteenths.....	33.222
One-eighth.....	7.386	Five-eighths.....	36.913
Three-sixteenths.....	11.074	Eleven-sixteenths.....	40.604
One-quarter.....	14.765	Three quarters.....	44.296
Five-sixteenths.....	18.450	Thirteen-sixteenths.....	47.987
Three-eighths.....	22.143	Seven-eighths.....	51.678
Seven-sixteenths.....	25.839	Fifteen-sixteenths.....	55.37
One-half.....	29.53	One.....	59.061

## Mining in Brazil.

The following notes are taken from a report recently published by the Minister of Agriculture of the Empire of Brazil:

## Gold.

Reports have been handed in from only five provinces. In Minas Geraes gold-mining is continued with greater or less profit. There are no statistics of the total production, but those of exportation are as follows:

Fiscal year.	Grams.	Value in U. S. coin.
1882-83.....	1,121,854	\$ 479,750 88
1883-84.....	1,166,855	502,278 84
1884-85.....	1,354,794	582,771 84

It is supposed that the gold production of the empire is much larger than these figures indicate, and, therefore, that considerable gold is smuggled in order to avoid the export duty.

## Iron.

The Minister thinks the mining of iron and coal in the empire of more importance than that of gold. The province of Minas Geraes has already more iron than gold mines in operation. In the province of Sao Paulo, the Ypanema iron mines are the only ones operated. These mines belong to the imperial government.

## Coal.

A Brazilian company is mining coal at Arroio das Ratas, in the province of Rio Grande do Sul. This company is said to turn out about 2000 tons a month, all of which is used for local consumption. At Tubarao, in the province of Santa Catharina, an English company is also mining. Some of its coal has been shipped to the River Plate, but the results of the shipment are not yet known. The quality of the coal appears to improve as the mines go deeper.

## Oil.

At Taubate, in the province of Sao Paulo, a company is working, to advantage, the oil-producing shales.

In the province of Bahia, the turfa deposits have been worked for oil, and have yielded, during the year, about 666 litres.

## Phosphate of Lime.

The imperial government has asked for and received tenders for the working of the phosphate deposits on the islands of Fernando de Noronha, a small group about 200 miles off Cape St. Roque. Two other concessions have already been granted for the working of deposits upon other islands along the coast.

The gold excitement at Los Gatos seems to have simmered down, as such affairs usually do after a careful investigation.

## Cause of Earthquakes.

## A Discussion of the Various Theories.

At the last meeting of the California Academy of Sciences, Prof. Joseph Le Conte, at the request of Prof. Davidson, the president, delivered a lecture on "The general cause of earthquakes, with special reference to the recent ones at Charleston." The lecturer spoke without notes and gave a very interesting discourse to a large audience. He spoke substantially as follows: There is no subject which has more interest than the subject of earthquakes, and the cause is obvious. It is because the origin of earthquakes is hidden from direct observation. Really the phenomena of the earthquake is complex, and that which has most tended to retard investigation is the suddenness with which they occur, creating terror and surprise.

## The Seismograph.

This difficulty will soon be gotten over by the use of the seismograph, which will not admit of surprise or other emotion. These instruments are being introduced into all earthquake countries, and principally in Japan, where the most satisfactory observations have been made. There will soon be one at Mount Hamilton, and another at Fulton, and we will then have a better opportunity of comparing notes with observations made in other places. We will have a better opportunity to notice the principle of induction. A feature of earthquakes appears to be, that in proportion as we extend our observations of them, they become more common. In Japan there are about 700 a year, or two a day. There is not an hour in any day in the year that the earth is not shaking somewhere. What we want is some theory that will give significance and coherence to the phenomena.

## Immediate and Remote Cause.

There are two kinds of causes. One is the immediate cause of the observed phenomena; the other is the remote, ultimate real cause, hidden deep in the bowels of the earth. As to the immediate cause, this we know: It is a rising of the surface of the earth from some hidden force, and spreading on the surface of the earth in a series of elastic earth waves. These are similar somewhat in origin to sound waves. The difference in sound waves and earth waves is a difference merely of rapidity of vibration. If they are so rapid that they are not noticed by the nerves, they are sound waves. If heavy, they become more or less dangerous, and we call them earthquakes. The phenomena are similar. The smaller ones we notice as sound; the heavier ones are from earthquakes. Suppose a concussion, no matter from what cause—say several tons of nitro-glycerine, buried deep in the earth. (Here the lecturer showed a diagram to represent a portion of the earth's crust, 40 miles long, 20 miles broad and 10 miles deep, the focal point being in the lower center of the figure, and the effect shown by concentric waves similar to that produced on the surface of the water when a stone or other substance is thrown in.) These concentric waves move with great rapidity, and it is the passage of these waves that constitutes what we call an earthquake. We must keep in our minds the direction of the wave motion and the direction of their propagation. Another thing we must notice is the velocity of the earth's motion and the velocity with which the wave is transmitted. The latter is by far greater than the former. By means of the seismograph we shall be able to accurately record these motions, and not only that, but the day, hour, minute and second at which they occur. The pencil, as soon as the earthquake is felt, will mark the time, the duration and the rapidity with which it is traveling, and even the motion of the wave will be recorded. There are several pencils doing duty, and these will also tell the direction of the wave and its angle of emergence, by which means the probable point of focus can be arrived at.

Several cases have proved that the focal point can be fixed. In the earthquake of 1834 the subject was discussed largely, and it was thought that the starting point of the shake was 50 to 100 miles in the interior of the earth. It was nothing of the kind, being only about nine miles. The one in Italy started from a depth of six miles. One in Japan was only three miles. One great earthquake recorded was found to have its focal center only half a mile in depth. This was in consequence of ex-

ceedingly limited character. It has been shown in many cases that the focus was not a point, but a fissure 8, 9 or 10 miles in length. This is a most important discovery. As to immediate causes of earthquakes, they are the result of a series of elastic shakes, and like all waves, subject to refraction, interference, etc.

The more remote cause of the concussions, the more remote the true cause of the earthquake. The agencies of the earthquake are of two kinds—the igneous and the aqueous. The one rough-hews the features of the earth, and the other shapes those features. One makes the great sea-bottoms and mountain chains, and the other makes the beautiful scenery and details of form of the earth. The earth forces we know about; the other is from the sun.

## Earthquakes and Volcanoes.

The association of earthquakes with volcanoes is natural. Take any map and you will note the similarity between the earthquake and the volcanic countries, although sometimes there is no connection. They never have volcanic eruptions in the Hawaiian Islands without earth shocks. There are also, of course, earthquakes without volcanic eruptions. But when volcanic activity ceases we are apt to have earthquakes. After Stromboli stopped its eruptions earthquakes were frequent. On the contrary, where they have had shocks for years the sudden opening of a volcano seemed to stop them. Some people think that there are cavities in the earth filled with steam, which finally discharge one into the other, causing earthquakes. In my opinion the fracture is more apt to produce them than the escaping steam. It is a curious fact that the Italian and French hold to gas being the probable cause, while the Americans, Germans and English hold different views. In 1835 there was an earthquake on the coast of South America, after which the entire coast line was elevated from 10 to 12 feet. There had evidently been a fracture and a slip, or likely a readjustment of an old slip. It is a well known fact that the interior of the earth is shrinking faster than the shell and something must give way, and it does give way by the crashing of the shell. Now, perhaps, an earthquake is produced by the snapping or readjustment of old fractures—a readjustment of broken parts. In South America changes are constantly going on. If the earth yields gradually to the forces which are constantly raising the coast of South America, there will be no earthquakes; but if it resists the force will eventually oblige it to yield suddenly, and an earthquake is the result.

Again, it is well known that the interior of the earth is contracting more rapidly than the surface, and the shrinkage of the shell on this is apt to cause motion of the surface; it gives way by crushing or folding. Every time the crust thus moves, we have an earthquake. Suppose the earth is composed of great crust-blocks, each hundreds of miles in extent. As the interior shrinks, those blocks must settle. If you look at the Coast Range of mountains, you will see there are at least five bends one way and five another, and if those were spread out, it would be found that two miles had been mashed into one. In one place 16 miles spread out would make 96 miles. This is not extreme. It is the Appalachian chain. In the highlands of Scotland there are immense masses folded over each other. These forces are almost inconceivable. It did not take place slowly. The whole surface of continents is broken by fissures, some 200 or 300 miles long. This breaks it up into great blocks, which slip and slip.

I know no better illustration than the

## Great Plateau of the Colorado.

That region is traversed by north and south fissures, 200 to 300 miles long, separated 20 or 30 miles, thus making great, oblong blocks of earth—sometimes very high. Some of the slips are 5000 or 10,000 feet and the escarpments 2000 feet. In the Basin region there are great earth blocks tilted on edge. These great escarpments did not occur at once, but every paroxysm caused an earthquake. This is by far the most frequent cause of earthquakes.

## The Electric Theory.

The most popular theory concerning earthquakes is that electricity causes them. I do not care to go into this, because it does not deserve more than a passing notice. Still, some scientists of repute uphold this theory. I will not assert there is "nothing in it," but only be-

cause the true scientist is not disposed to be bigoted. But this I can say: I never heard or read the slightest scientific proof of this theory. Electricity has taken hold of the popular imagination, so that any inexplicable thing is explained by "electricity." For example, vital force, nerve force, etc., are inexplicable, so many lay it to electrical force. So also with earthquakes—electricity is made the scape-goat. They have said we have earthquakes in California on account of the "glorious climate" and the absence of thunder storms. Others have said our last great earthquakes were before the railroads came in 1869: we have none now. As to

#### California Earthquakes.

Fissures and slips of crust may occur anywhere. But there are certain places where there are lines of weakness. One of these places is at the line of the foot of a chain of mountains on one side, where the bending of the up-lifted earth is great. Another place is along the line of continents. Along the base of mountains, say the Sierra Nevada, there is a chance for frequent shocks. The great Inyo earthquake occurred at such a place. There is a split right at the base of the mountain going for 40 miles with a drop of 20 feet. The Sierra Nevada, in rising, dragged up the more level land gradually with it; but a final readjustment caused an earthquake, as it always will.

The cliffs at the Wasatch mountains are of similar formation, and some day Salt Lake may be destroyed. On this side of the Coast Range, near Niles and Haywards, there is a line which adjusts itself from time to time, as the foldings of the mountains show. On the Atlantic coast there is a line of weakness extending from New York to the gulf, the formation being of tertiary origin, and the consequence is frequent oscillation. When I heard of the Charleston disaster I made up my mind that it was an off-shore line. Earthquakes all over the globe have had points of resemblance to this one. It is usually a movement of the sea bed off shore that gives rise to the sea wave and earthquake. Along the old primordial continent margin is a place where there is a bend in the earth, that makes the ocean bed, and a readjustment of the old contracted margin makes earthquakes possible. Sometimes waves occur, and sometimes not. The old Archæan rocks are covered by tertiary and other rocks. These rocks broke and slipped and affected less and less the sea-bottom. My object in speaking to you to-night is to put your minds in a position to judge for yourselves when the details of facts of the late earthquakes are available.

#### Sectional Slag and Matte-pot.

Slag and matte, in lead and copper smelting, are, for convenience of removal, tapped into pots of small capacity, usually of paraboloid form, of cast iron, weighing 275 to 300 pounds, and holding the same weight of slag.

As in many smelting districts one ton of ore makes a ton and a quarter of slag, a large number of pots is needed to equip an ordinary plant.

Sudden and frequent expansion of the solid bowl causes the pots to crack at the bottom in a few months, and the matte, a very fluid sulphide, enters these rough fissures and speedily corrodes its way through the vessel. With a slag-pot having a movable bottom, this cracking tendency is entirely overcome.

The pot invented by Richard H. Terhune, of Salt Lake City, and described by him before the American Institute of Mining Engineers, is cast with a six-inch hole cored in the bottom. This results in a stronger casting than a solid one of the same form. Into this hole is inserted a flanged bottom, as shown in plan and section in the accompanying figures.

Mr. Terhune finds that four rivets, countersunk inside, make a tight and permanent joint, although the patent claims every possible mode of securing the bottom, as well as all forms and sizes of the same. The castings are made rough, and cost less for founder's charges, because they are lighter than the solid bowl.

GOLD mining in Hawthorne district is increasing. The early prospect of a mill makes a number of mine and claim-owners feel rich.

WORD comes from Granite district, which is about 18 miles south of Cherry creek, in the Egan Range, of a most flattering nature.

#### Reduction of Ferric Solution.

At a recent meeting of the American Institute of Mining Engineers, A. L. Beebe, of New York, read a note on the reduction of ferric solutions by the use of amalgamated zinc and platinum foil. In the determination of iron on sulphuric acid solutions by titration with potassium permanganate, amalgamated zinc and platinum foil are very generally employed to reduce the iron to the ferrous state. As ordinarily employed, their use for this purpose is frequently attended with two practical difficulties. The first is the amalgamation of the platinum strip through its contact with the zinc, and the consequent cessation of all reducing action. The second is encountered in transferring the solution from the reducing bottle to the beaker in which the titration is to be made. Unless great care is exercised in this operation the zinc will fall into the beaker, fracturing it and causing the loss of the analysis.

The following simple modification of the usual method has been found by Mr. Beebe to obviate entirely the difficulties above referred to. A strip of thin platinum foil, about one inch square, is perforated with pin-holes over its entire surface. It is then bent into the shape of a letter U, and its opposite corners are

Fig. 1—Section.

connected by short pieces of platinum wire, so as to form a sort of basket. In this is placed a piece of amalgamated zinc of convenient size, and the whole is suspended by a stout platinum or silver wire in the bottle containing the solution to be reduced. Another strip of platinum foil, about  $1\frac{1}{2} \times 2\frac{1}{2}$  in size, is then dropped into the bottle, in such a way as to lean against the wire supporting the basket and zinc, without coming into contact with the latter.

Galvanic action at once commences, and hydrogen is evolved in abundance from the surface of the foil, which never becomes amalgamated, as it comes into indirect contact only with the zinc.

When the reduction is complete the platinum

Apparatus for Reducing Ferric Solutions.

basket containing the zinc is removed from the solution, washed in the titrating beaker and laid aside, all danger of fracturing the beaker being thus avoided.

In the accompanying figure which shows the arrangement of the apparatus when in use, *a* is the large platinum strip, *b* the basket, and *c* the piece of amalgamated zinc.

DURING the month of August all work was suspended in several of the producing mines of Montana. On the 21st ult. the Anaconda mine was closed down, thereby throwing nearly 200 men out of employment. Two weeks previous to that about 150 men were laid off from the same mine, making a total of 350 miners who have been deprived of their means of support.

#### Coal-mining Abroad.

In California we get a great many cargoes of coal from Great Britain and Australia in ships which come here for our wheat and bring the coal at low freight rates. And England is very glad to get rid of her coal, for her coal exports are on the decrease. The reason of this is easily seen in the fact that her best customers are developing their own resources. Even our local conditions show this, for as our needs for coal expanded, while more was naturally imported, the coast mines were also developed and increased their output largely.

In the first half of 1885 England exported 11,433,338 tons of coal, while the first half of this year she only exported 10,659,066 tons. The principal falling off has been to Russia, Denmark, Sweden and Norway, countries now developing their own resources. In Russia, particularly, inducements are held out to capital to open the mines. Russia has immense coal fields, second only to those of the United States; and her fields can be easily worked. Her production is greatly increasing, while English exports continue to decline. Referring to this, the *London Mining Journal* says:

In the first half of 1884 we exported 671,716 tons of coal to Russia, and 769,271 tons to

Fig. 2—Plan.

Fig. 2—Plan.

Sweden and Norway; but in the same period of 1886 the quantities were respectively 507,338 and 713,252 tons. Sweden and Norway, however, in the first half of 1885 took from us 773,404 tons of coal, making the decline during the present year of a still more marked character. Indeed, there is no mistaking the fact that the falling off in our exports of coal to the leading continental markets is becoming more pronounced, and must seriously affect our own mine-owners and miners. There are no fresh markets to be opened, while our hold of many of those in which we have done a very large trade is fast being relaxed. We are now doing less than formerly with France, Italy, Denmark, Sweden, Norway, and British India, and seeing that our exports have been equal to one-sixth of all the coal raised in Great Britain, those connected with coal mines at home may well think it worth considering as to what is likely to be the future of our export trade in coal. With respect to the mining progress made by Russia it may be stated that the quantity of coal mined in that country in 1867 was 437,625 tons; in 1877 it had increased to 1,769,785 tons. In 1884 it had increased to 4,200,000, and last year the production was estimated at 4,500,000 tons.

CHANGED TO A COAL-BURNER.—The ferry steamer *Piedmont*, on the San Francisco and Oakland route, has had her furnaces changed from a petroleum refuse oil to coal friction. It was found by experiment that the coal—Carbon Hill—steamed more freely than the petroleum refuse heretofore used, the difference being seven per cent in favor of the coal burning. This change is induced by the peculiar style of boilers of the *Piedmont*, they having been built for coal. The company continue the use of the petroleum refuse in the *Solano* and on the Oakland freight-boats, their boilers favoring an "oil burner."

The long strike at the Union Iron Works in this city is practically ended. The Union molders have gone back to work again. The original object of the strike was to force the company to make a shipwrights' Union yard of the shipyard, and in this it has utterly failed. The Wood, Iron and Steel Shipbuilders' Association remains in the ascendancy, and the members of the Shipwrights' Union remain out. The shops now have a full complement of men; but the boiler-makers have not given up yet.

WORK has been commenced on a second railroad into the Cœur d'Alene, and it will be open for traffic by the last of October.

#### A Sensitive Mining Lamp.

In Germany, where it was invented, the Pieler safety lamp for mines is now commonly used, having displaced the famous Davy in a large number of mines. In Belgium it is largely used, and the French are also adopting it. This lamp is solely intended for testing purposes in mines. It burns alcohol and reveals the presence of fire-damp when the latter is present in any proportion greater than one-fourth per cent. In this extreme sensitiveness lies the value of the lamp for miners. It is described in the report of the Royal Commission on Accidents in Mines as follows:

Pieler's is a large Davy lamp constructed to burn alcohol with an Argand wick. The air supplied to the inner part of the flame is admitted by a tube, protected by superposed disks of gauze, which passes vertically through the vessel containing the alcohol. Around the flame is a short conical chimney, open above and below, and the flame is so regulated that it does not appear above the chimney, its height being, therefore, from 1 to 1.25 inches. In gas this spirit flame yields a much more conspicuous cap than can be produced by the flame of ordinary vegetable or animal oil. \* \* \* The Pieler lamp is obviously a most sensitive gas detector, but in its present form it is quite inadmissible for use in well-ventilated mines, for the following reasons: The flame is easily extinguished by a very moderate current; and if the lamp happens to come into an explosive mixture of gas and air an explosion is almost certain to be caused in a few seconds. The lamp could be rendered less dangerous for general use by inclosing it in a case, and, as far as we have been able to observe, its power of indicating the presence of gas would be but little if at all impaired.

These remarks of the Commissioners are evidence that their work has, in some at least of its particulars, not been brought up to date. The defect here alluded to was long ago remedied. In the earlier construction the combustion of the spirits and the gas caused the gauze to become red hot in a few seconds, but in the lamps now in use the flame is extinguished by the ignition of the gas.

#### Blowing Whistles without Steam.

Oscar Reichling, engineer of the Kennedy, has solved the problem of how to blow a steam whistle by water power. Water is turned into a boiler to which an ordinary whistle is attached, and the air in the boiler is compressed, thus generating sufficient force to produce a successful toot, which is now regularly heard. It is necessary to turn the water into the boiler about 12 minutes before the show is to come off. Mr. Knight, of Sutter Creek, has also made a successful blow by the use of the same means, but the credit for the discovery must be awarded to Mr. Reichling, as he had the idea six years ago, and, in fact, told both Mr. Knight and Mr. Murray, of the foundry, of it.—*Amador Sentinel*.

This can hardly be called a new invention, as it has been in practical use for many years at the Spring Valley Hydraulic mine in Butte Co.

It was introduced by Mr. Gardner F. Williams, while superintendent of that mine. The method adopted by Mr. Williams was as follows: An air receiver (used during the construction of a bedrock tunnel) was placed on end and connected with the large hydraulic pipe by means of an inch and a half gas pipe, with a valve to control the flow of water. An ordinary steam whistle was attached to the receiver.

Water is let into the receiver under a pressure of about 80 pounds per square inch. In about one minute's time the air is compressed sufficiently to blow the whistle. After the compressed air is exhausted the water is discharged from the receiver through a waste pipe, and it is again ready for refilling.

AN EASTERN OPINION ON GRAIN SHIPMENTS. The *St. Louis Railway Register* seems to think that the Pacific Coast people don't keep abreast of the times. Hear it: "When the people of the Pacific Coast learn to use elevators instead of sacking their grain they will reap a larger profit." The elevator is "an institution" out West, and in its place is very useful and a cheap way of handling grain, but the requirements of our foreign shipments are sacked grain and none other. In fact, we could not sell a pound of unsacked grain for shipment, so we think we know what we are about, the *Railway Times* to the contrary, notwithstanding.

THE Reno Milling, Smelting and Reduction Works Company have made the survey and located the ditch from the river to the point on which the works will be located.

## MECHANICAL PROGRESS.

## Working and Tempering Steel.

To work steel, never heat above a light cherry red for hammering, says the *Iron Trade Review*; then hammer light and quick until nearly black, as this improves the steel and will make tools that will double the work over that not so treated. The hardness of steel is governed entirely by the heat when it is dipped in water; for instance, a piece of steel dipped at a bright cherry color and drawn to a straw will be very much harder than a piece heated to a dark cherry red and then dipped and drawn to a straw. Try it.

The forging, hardening and tempering of steel is an art that but few understand, as its knowledge is only gained by experience, and but few ever give it to others; yet in a few words I will try and give some of the principal elements to workers of steel, which if followed will save you many losses and give you a reputation for working steel that will insure you good and serviceable tools, as well as increase your gains.

Please remember that the heat at which steel is worked and that at which it is hardened are two of the vital elements to produce good and serviceable tools. If heated above a light cherry red, some of the vitality of the steel is destroyed, and it would in heating too many times return to iron. If heated too hot when hardening, it would fly to pieces, destroying your labor as well as giving you a poor reputation.

Remember, also, to hammer your work lightly at a low heat, as this improves chisels, drills, lathe tools and edge tools most wonderfully; also take as few heats as possible, as overheating and too frequent heating reduce the steel to iron by destroying the carbon.

To harden taps, rimmers, chisels and drills, always dip them slowly to the depth desired in as near vertical line as you can by the eye and hand, then move in a circular position until cold, but never any deeper in the water than first dipped, as this prevents them from cracking, which they would be likely to do if held perfectly still and the water formed a line around them. Do not change the water in which you temper, but as it wastes fill up the tank. If you are obliged to use fresh water, always heat a piece of iron to put in it and bring it to such a warmth as is perceptible to the hand, as steel is liable to crack when dipped in cold water. When you have heated your article to be tempered, take it from the fire and examine it to see if any flaws are observable in the steel, as this will prevent your having poor pieces of steel, laid to your carelessness in hardening.

In cutting up steel a thin, sharp chisel should be used, as a blunt one is liable to splinter or crack the bar, which will not be seen until it is tempered, and then the labor is lost with the steel.

## Colors of Different Articles for Use.

Taps should be hardened and then brightened by rubbing emery and oil on the clearance, and then draw on a hot plate or in a heated ring to a draw straw color.

Dies should be a bright straw color and drawn on a hot plate or in sand.

Drills for iron should be a dark straw on the cutting part and the rest a blue.

Chisels for iron should be a violet color; for cutting stone a purple is required.

Milling cutters should be of a yellowish white. Gear teeth cut the same color. The usual way to dip these is to have a rod with three prongs to pass through the hole after it is heated to dip with, lower slowly until all the cutter is under the water about two inches, then move in a circular position until thoroughly cold, remembering that a great many things break by taking from the water before they are cold, especially large pieces of steel, as the center retains the heat, and when taken from the water it expands the outside and causes it to crack.

In tempering pieces, have a thick and thin edge, always the thickest part first. Study the pieces you have to harden and it will help you very much. Large centers in work for tempering should be avoided, as they are liable to cause the end to split open.

**CYLINDER CONDENSATION.**—Though cylinder condensation is a well-recognized foe to fuel economy in engine practice, it is not always that even the simplest precautions against it are adopted. It may therefore be sometimes well questioned whether steam users are as well aware of the advantages of using dry steam as they ought to be. If steam in a perfectly dry state could be used, cylinder condensation would, of course, be reduced to a minimum, since dry steam, like any other gas, conducts heat very slowly. With wet cylinder walls, however, due to the use of saturated steam, the moisture will often evaporate freely, taking up the heat necessary for evaporation from the surfaces on which it rests. Still, saturated steam, which, incidentally remarked, is steam in the critical condition, the slightest loss of heat causing condensation, does not by any means offer the best possible conditions for such condensation, as many popular forms of boilers supply steam which contains a much larger percentage of moisture than is generally supposed. With them it would be advisable and obviously profitable to adopt some arrangement

by which the cylinders could obtain a supply of dry steam. Moderate superheating would accomplish the object admirably; but even a judicious planning of the pipe connections, the use of baffle-plates in extreme cases, or the addition of suitable traps, would result in direct benefit.—*Iron Age*.

## Rapid Adoption of Steel Railway Sleepers.

Notwithstanding the unfavorable reports of many engineers and railway superintendents in regard to the use of steel or iron railway sleepers, on account of their large cost as compared with wood, they are coming into quite extensive use in Belgium, Germany, France, and other European countries, and lately large quantities have been sent from English steel-works to India. The London & Northwestern Railway Company has introduced Mr. Webb's sleeper on various parts of its system. It is highly spoken of by several railway engineers, and is reported to have given very satisfactory results. The Midland Railway Company has laid down several miles of steel sleepers similar in section to Mr. Webb's, but with a cast-iron chair, bolted with Ibbotson's patent bolts; and it is about to lay a further portion of its road with the same sleeper. The Metropolitan Company has also determined to lay down steel sleepers, and other companies in England will, without doubt, soon follow these examples.

London *Iron* says that one of the most promising outlooks at the present time in the steel business is undoubtedly the extended adoption of steel sleepers, and adds that it may be assumed that, before many years are over, this branch of steel manufacture will be largely extended at English works. An important field for the steel sleeper lies in the direction of collieries. It is well known to all mining engineers and managers of collieries that a large sum of money is annually expended in the maintenance of wooden sleepers and tramways under ground, and steel sleepers would seem to possess great advantages for this purpose. A strong, yet light, corrugated steel sleeper, with a special steel clip for fastening, for colliery purposes, has been patented by the manager of the Tredegar Iron and Coal Company. In this sleeper, two holes are punched in each end and the steel clips are put in after it is laid, the rail being keyed up by a steel taper-key. The corrugated sides of the sleeper, with the two protecting fangs at either end, enable it, when laid down, to become very firmly attached to the ballast or road, thus preventing any movement when loads are passing over sharp curves. The weight of the sleeper, with two steel keys and clips, is 16½ pounds. It is stated to have been at work for some time in collieries in South Wales, where sharp curves and steep gradients exist, and has been found to work very satisfactorily.

**SHEET IRON IN CONSTRUCTION.**—It will require very little observation to convince one that the use of sheet metal in building construction has of late very considerably extended, while its adaptations in this important field have likewise gained in variety and importance. It may safely be affirmed that at the present time tenfold more sheet metal is used for building purposes than was used less than ten years ago; and its advocates claim, and not without good cause, that its utilities are only beginning to be appreciated at their proper value. New uses are being found for the material every year. Among the more recent of such applications may be named, for example, fire-proof corrugated iron arches for ceilings; finely corrugated sheet metal, tastefully decorated, for the interiors of public halls, theaters, offices and stores, to say nothing of other special uses in building to which the material readily adapts itself, and not omitting mention of the well-known and successful use of sheet iron for roofing and siding, for which purposes immense quantities are annually consumed. Of these products, it is not invidious to say that the corrugated forms of sheet metal are for most purposes decidedly the most useful, and the enormous increase in the demand for these products is the best evidence that could be presented to demonstrate the fact.

**NEW PROCESS FOR MAKING STEEL PIPE.**—The Berlin *Eisenzeitung* contains an account of a new process for manufacturing steel pipe and tubing, of which it speaks in an enthusiastic manner. A syndicate has been formed to build works at Burbach. A large firm in Paris proposes to apply the method to the manufacture of copper tubing. The following is the process alluded to: As soon as the steel is cast into the round mold a core is thrust down into the steel, so that a tube is formed between it and the walls of the mold. In order to prevent cracking of this annular casting during the cooling, the core is so made that it follows up the shrinkage of the steel. The steel cup thus obtained may then be rolled in an ordinary train. Trials made at the Burbach works have been very successful.

**IMPROVED BARBED-WIRE FENCE.**—A Pittsburg mechanic, Charles Rogers, has secured a patent on an invention which, it is claimed, will revolutionize the barbed-wire fence business. The invention is for barbing metallic strips about three-fourths inch wide, and with the machine bars are cut ranging from one-fourth to one-sixteenth inch in thickness.

## SCIENTIFIC PROGRESS.

## Salt-water Ice.

Marine ice was formerly regarded as formed of solidified pure water, retaining, by mechanical adhesion, traces of the saline liquid. These traces could be expelled by energetic pressure, when acids and gases would be found in the residue of the desiccation in invariable proportions, as it existed in the sea.

The question of the chemical composition of the ice of the Arctic ocean is complicated in other ways. But it gains in interest what it loses in simplicity. When salt water is frozen artificially a small part escapes solidification. The uncongealed residue is insupportably better, and analysis shows that nearly all the manganese is concentrated in it. The solid block, if it is homogeneous, and is not full of holes, and if previously drained, may furnish a passable drink. The ices of the Northern ocean are frequently moistened with a kind of brine, which sometimes embodies crystals of a special character, easy to distinguish from the ice around them.

With congelation a sorting of matter takes place; most of the sulphuric acid passes into the part that solidifies, while magnesia and chlorine prevail in the part that remains liquid. Under the influence of variations of temperature all the chlorides in the ice will gradually disappear—some go into the sea and are dissolved, while the rest appear on the surface and form hydrated crystals or a kind of "salt snow." The sulphates thus prevail exclusively in old ices, which constitute mixtures of solidified water and a peculiar chemical compound—the cichydrate of sulphate of soda, a body which, containing 5 parts of soda to 95 parts of water, is decomposed at a little below the ordinary freezing point.—*Ex.*

**POLARITY IN TADPOLES.**—We recently copied a short paragraph from the *Scientific American* corresponding under the above head, which stated that when a current was passed into the dish containing any number of tadpoles (the poles of the battery being immersed in the water), all of them without exception took up "one position, that in which the head was turned to the anode and the tail to the cathode." From this fact it was assumed that tadpoles possessed the principle of polarity. A later correspondent of the same journal writes as follows: "I see nothing really surprising in this, and certainly nothing that would prove 'polarity' in the tadpole. The 'shock' from the cathode is always a great deal stronger than from the anode; also, the head of the tadpole (as in all animals) is the more sensitive portion of the body, electrically; hence the cathode presented to the head, if the current be strong, becomes quite powerful, whereas, if presented to the feet or tail, the current is much less severely felt. The arrangement of the tadpoles with their tails to the cathode is the position they should assume in order to reduce to a minimum the unpleasant sensation of the passage of the electrical current through their bodies. Confine a man in such a way that the current from a battery must pass through his body from head to feet, and he would very soon arrange himself with his feet to the cathode and his head to the anode, and yet this would be far from providing 'polarity' in the human body. There may be 'polarity' existing in the tadpole, but a different experiment than that made by Prof. Herman is necessary to prove it to me."

**SCIENTIFIC SURVEY OF SOUTHERN CALIFORNIA.**—James Stevenson has just been instructed by the Director of the United States Geographical Survey to proceed to San Diego for the purpose of making plans for the topographical survey of Southern California, especially with the view of reporting upon the site for a base-line and for connecting it with the coast survey triangulation of the region, and for determining the best season in which this work can be performed. He is especially to learn if the work can be advantageously prosecuted during the winter season. Stevenson will also be instructed to make such ethnological notes and collections as the circumstances will permit without detriment to the work. Stevenson will, while there, make explorations of several of the small islands just off San Diego, on which it is reported that there are many important and interesting Indian remains and relics. It is believed that much interesting data respecting these subjects, as well as information regarding the fauna of these islands, will be obtained, as they have not hitherto been carefully examined in a scientific way.

**PHOTOGRAPHING CANNON-BALLS.**—It is well known that cannon-balls have been most successfully photographed when on their flight from the cannon's mouth, but it seems that quite recently such photographs have been obtained, many of which show, in a remarkable manner, the head of condensed air which precedes the shot. It is this head of condensed air which makes it almost impossible, even for the most skillful rifleman, to hit an egg-shell suspended by a longish thread; and doubtless it is this "head" of condensed air which first wounds when an animal is hit by a rifle shot.

**CREOSOTE** is spoken of rather widely among scientific men as promising to play an important part in the future in the generation of both heat and light. An apparatus has been in-

vented for the making of steam for ships of war by its aid, and also for utilizing creosote as an illuminant, mixing it with about four times its own weight of air. The lights are said to be highly satisfactory, the light obtained being useful at a distance of nearly 200 yards from its center.

**AN ELECTRIC MINING LOCOMOTIVE.**—Electricity has for some time been employed by the Trafalgar Collier Company for underground ventilating and pumping, with so much success that it was resolved to extend the use of this agent also to its underground railroads. In Germany, there are several collieries so worked; but in these cases the current was sent to the locomotive by fixed conductors. In the Trafalgar colliery, the electric locomotive carries its own store of current with it, in a series of accumulators, the weight of which represents so much useful adhesive weight on the rails. Where the underground lines have sharp curves, haulage of trains by wire ropes presents great difficulties, and horses are generally employed. This locomotive has been designed by Mr. A. Reckenzaun, and has been in use for several weeks. The construction of the motor and driving gear is similar to that adopted in electric street tram-cars, but the conditions to be satisfied were widely different and more difficult than those obtaining in an ordinary tramway. The space is very limited, and since both sharp curves and heavy gradients occur at frequent intervals, it was somewhat difficult to stow away the necessary power in so limited a space. Within the narrow gauge of two feet seven inches, and an extremely short wheel-base, there had to be arranged an electro-motor of eight-horse power, with suitable gearing, brakes and attendant details.

**SUGAR AND SWEETS.**—Sugar is charcoal in another shape, established by another way of blending the three elements of which it is composed. The principal members of the sugar group in the order of the quantity of water they may be supposed to contain are: Woody fiber, starch, gum arabic, cane sugar, fruit sugar, grape sugar, milk and sugar inosite or the sugar of animal muscle. All these will ferment and are called true sugars. There is another class also possessing great sweetness, which will not ferment, and are somewhat differently constituted, as, for example, the sugar of manna or licorice. Though all these are called by the same generic name and are allied in constitution, they are perfectly distinct bodies, each with its own properties. There are some sweet compounds, sweeter even than sugar, that are anything but eatable, as glycerine, sugar of lead, chloroform, salicilate of soda and the new sweet recently found in coal tar, known as saccharine—which is several times sweeter than cane sugar. Previous to discovery of saccharine the sweetest compound known was a solution of chloride of silver in hyposulphite of soda.

**SEA-SERPENTS.**—The belief in the occurrence of "sea-serpents" in the ocean of to-day, though hardly openly avowed, is not discounted by not a few scientific men whose opinions are entitled to the highest consideration. Dr. J. B. Holder, after giving (in the *Annals of the N. Y. Academy of Sciences*) a historical account of a "sea-serpent" observed near Boston, corroborates the adduced testimony by the description of a carcass of a large and unknown animal found off the coast of Florida, as related by highly credible witnesses. The creature described was over 40 feet in length, and nowhere of more than two feet in diameter. Unfortunately the specimen was in an advanced state of decomposition, and no portion was saved. The discovery of the giant squids off the Atlantic coast within recent years demonstrates the possibility of other large animals yet inhabiting the ocean, of whose existence science is yet wholly unaware. May not some descendant of the cretaceous mosasaurs or plesiosaurs yet be among them?—*Science*.

**THE TEMPERATURE OF SPACE** is, at the present day, generally assumed to be much less than the lowest temperature yet produced by artificial means; and it is interesting to note the efforts made to produce extreme cold. Stewart on "Heat," p. 110, gives an example in which a temperature of 220° F. was obtained, but very recently (Van Nostrand's *Eng. Mag.*, xxxv, p. 57), in solidifying oxygen, a temperature of 330° F. is said to have been produced, which is only 131° F. above absolute zero.

**SUN SPOTS AND THE WHEAT PRODUCT.**—A writer in *Nature*, basing his statements upon observations in India, maintains that there is a remarkable correspondence between the periodicity of sun spots and the recurrence of high or low prices of wheat in that country; but as regards the United States, facts are at variance with any such theory.

**THE OBELISK** in Central Park, New York, seems to be by no means safe from destruction, as it has recently been found to be suffering from exposure to heat and moisture. The plan for protecting it against the climate has not only utterly failed, but it is said to make matters worse.

**IGNATIEFFITE—A NEW MINERAL.**—General Ignatieff has presented to the Mineralogical Society of St. Petersburg a mineral recently found on his estate in the Government of Elizabetgrad. It belongs to the class of aluminates and has not hitherto been found in nature.

## A New System of Preserving Food.

A new system of preserving fresh food has been under trial for the past year or so, and, having satisfactorily survived numerous severe practical tests, is now being publicly introduced. This process is the invention of Mr. August R. Roosen, of Hamburg, and its novelty consists in the fact that it is carried out without reference to temperature, while its importance is due to its economical character and its proved success. It partakes of the chemical and the mechanical nature, and consists in placing the food to be preserved in an innocuous antiseptic solution, and submitting it to continued pressure until required for use. So far the main experience has been obtained from the preservation of fresh fish, and with fish, therefore, we will deal, our own observations, too, having been made with this class of food.

In practice large steel barrels are provided, having lids which can be hermetically closed. The fish as captured are placed in a barrel, which is nearly filled with a solution consisting of 97 per cent of fresh water and three per cent of boracic acid, tartaric acid, and salt in certain proportions. The lid is then fixed on, and by means of a small hydraulic hand-pump water is pumped in until the cask is full and the air expelled. This condition is ascertained by a fine stream of water spurting through a hole in a screw nut, which is then screwed down and the orifice thus closed. The hydraulic pump is then worked until the pressure reaches about 80 lbs. per square inch, when the pump is detached, a small valve in the cask lid being closed by back pressure from within. The process is now complete, and by it fish is preserved for lengthened periods.

It will thus be seen that the process is simple and can be easily carried out by any ordinary laborer or fisherman. In the case of fish, smacks or steamers would be provided with the steel barrels, in which the fish would be placed, either gutted or ungutted, and treated as we have just described; the operation of filling the barrel, exhausting the air and putting on the pressure occupying only a few minutes. On being discharged from the vessels the casks can be forwarded to the inland centers of consumption, or they may be emptied and their contents forwarded by rail, as the fish will keep in a perfectly fresh condition for a number of days after being taken from the casks. Within a few weeks, more or less, the efficiency of the process is not affected by the length of time the casks remain unopened. These casks will hold about 300 pounds of fish, and it is intended to let them out at a charge which will, it is stated, with the cost of the solution, and assuming that they are only filled 20 times in the course of the year, cause the total expense not to exceed one-fifth of a penny per pound of fish.

The Roosen process appears destined to become very important in connection with the food supply of this and other thickly populated countries. It will effectually prevent the enormous waste which, in the fish trade particularly, has been hitherto unavoidable; but it is stated to be equally applicable to meat and any other kind of food. Large quantities of perfectly fresh fish can be forwarded from the fishing stations to the large cities and towns, and placed on the market for immediate sale or kept until there is a demand for them. Numerous practical tests have been made to demonstrate the commercial value of the process. Fish have been sent from Norway to London and Paris, and from Shetland to different parts of Scotland, and recently the process has been shown in Edinburgh, Leith, Hamburg and Berlin, and has been pronounced by the highest authorities in the fish trade to be a complete commercial success. On July 1st a steel cask in which a quantity of beef had been placed under pressure on February 5th, or about five months previously, was opened at Copenhagen, and on part being boiled and part roasted both were eaten and were stated to be of perfectly good flavor. Lobsters have also been kept for 14 days, and then eaten and found to be quite fresh.

It is claimed for the Roosen process that it absolutely arrests putrefaction, and kills or destroys the germs of any putrefactive or other bacteria which may have been present in the blood, body, or viscera of the fish or meat submitted to its action. It is said to preserve for an indefinite period the muscular tissues of fish and animals in the first stage of the changes which follow death, and which, under ordinary circumstances in summer, does not last more than 24 hours. These important results are achieved by the pressure on the antiseptic solution in which the fish or meat is immersed, which pressure causes a direct inhibitory action upon the vital processes forming part of the development of putrefactive and fermentative bacteria. The antiseptic solution used, of which, as we have stated, boracic acid is the base, does not impart any taste whatever to the food treated, and is claimed to be absolutely innocuous to human life and health, although destructive to the lower organisms which cause decomposition.

WORK on Stoneman hotel in the Yosemite is progressing rather slowly because of difficulty in hauling lumber in sufficient quantity from the mill at Gentry's station. The daily product of the mill is about 12,000 feet, and it is hoped that the needed supply for the new hotel will be sawed by September 15th. The contractors expect to have the building inclosed by Nov. 1st.

## USEFUL INFORMATION.

**A LUBRICANT FOR BRASS.**—Lard and grease have, as is well known, a corrosive action on brass and copper, and this is a drawback to their use as lubricants for these materials. It has been pointed out that, while both melted india rubber and vaseline are without corrosive action on brass, each alone has a disadvantage. Thus melted india rubber is too glutinous and in course of time hardens. Vaseline never hardens, but it is deficient in tenacity and adhesiveness. A mixture of both substances is therefore recommended, consisting of one part by weight of melted india rubber and two parts of vaseline. The rubber should be pure, not vulcanized, and cut into shreds, then melted at the lowest possible temperature in an iron cup while being pressed down against the hot cup and stirred into a uniform glutinous mass. The vaseline of the common thick brown sort should be added to the india rubber and the whole thoroughly stirred and blended together.

**A EUROPEAN STREET-CAR RAIL.**—A notable advantage which the chief European cities have over most American cities is the method followed in using the streets for railway purposes. A style of rail is laid that offers advantages both to the railroad company and to the owners of ordinary wheeled vehicles. The iron is molded as a broad flat bar or slab of about six inches width and one and a half inches thickness. The upper side is slightly crowned or rounded, and midway along it is a concave groove of about seven-eighths inch depth and seven-eighths or one inch width. This groove takes the flange of the car-wheel, and the tire or broad part of the wheel runs upon the upper surface of the rail. An important part of the method is in having the rail the full breadth of the upper edge of the timber on which it rests. This permits the paving blocks to be crowded up against the edge of the rail.

**THE DECLINE IN THE SHIPBUILDING INTERESTS** of the United States, noticed for so many years, at last appears to have been arrested. The Commissioner of Navigation is now engaged in compiling the shipbuilding statistics for the last year, and from the results already reached forms the opinion that the aggregate tonnage built in the United States during 1886 will be shown to have been fully equal to that for the fiscal year 1885. The increase in the number and tonnage of iron ships built continues steadily, but it is not sufficient to affect the continued decline in wooden shipbuilding. The tonnage of iron vessels constructed, which was 25,582 tons in 1880; 28,392 in 1881; 40,097 in 1882; 39,646 in 1883; 35,631 in 1884; and 44,025 in 1885, will show further increase, probably in as large proportion as the increase of 1885 over 1884. The decline of the tonnage of wooden vessels constructed will be more rapid than heretofore.

**ALLOY OF ALUMINIUM AND TIN.**—The applications of aluminium are now considerable, and M. Bourbouze, a French physicist, has added to their number by employing an alloy of the metal with tin for the internal parts of optical instruments, in place of brass. The alloy he employs consists of 10 parts of tin and 100 parts of aluminium. It is white like aluminium, and has a density of 2.85, which is a little higher than that of pure aluminium. It is, therefore, comparatively light, which is an advantage for apparatus where lightness is desired. It can be soldered as easily as brass, without special means, and it is even more unalterable than aluminium to reagents. The attention of electrical instrument makers should therefore be called to it, especially for apparatus of a portable character.

**THE ECCENTRICITIES OF TRADE** between the United States and South America are illustrated by a Valparaiso letter in a late number of the San Francisco Bulletin, saying that "an amalgamating machine was shipped from Chicago to New York, thence to Germany and thence to Coquimbo, Chili, all to save time and money." The letter adds in another paragraph: "Fancy for a moment that the German steamer has just gone in with a lot of American goods on board, which were shipped to Germany from New York and thence here, and that this has been going on for months and months, daily increasing; that coming this way is cheaper than Panama or direct around the Cape, and quicker besides. Of course those goods are credited in the custom-house as German importations, the United States losing these heavy items in their statistics of Chili trade."

**SOUTHERN SAW-MILLS** are occasionally cutting into a grape-shot imbedded in trees during the late war, and a firm that makes saws publishes as an advertisement the statement of a saw-mill owner that the finely-tempered saw he bought of the said firm had sawed clean through one of the shot one and one-fourth inches in diameter without hurting the saw, that he could cut two more logs into lumber before stopping, and then needed only 35 minutes for filing before going on as good as new.

**DANGER FROM ELECTRIC LIGHTS.**—On the morning of July 31st, for about three hours before daybreak, those streets in New York lighted by electricity were left in absolute darkness. The private electric lights at all stores, hotels, etc., were also extinguished. Electricians say

that the lightning which accompanied the storm was the most vivid ever seen in that section, and threatened to work considerable damage to the wires throughout the city. Perceiving the force of the current, and the likelihood that some of the machinery at the works would be burned up or twisted to pieces, orders were given to shut down altogether, and no light was furnished until after the storm. It is believed that a fire would have occurred had not this precaution been taken. In the old city proper all the old gas lamps are kept in good condition, to be used in case of an emergency of this kind.

"MOONLIGHT nights are the bane of railroad engineers," recently remarked a head official of the Baltimore & Ohio Railroad. "All engineers dread moonlight nights. They try the nerves to the utmost. Engineers like to run on dark nights. On a moonlight night the trouble with them is no trouble at all—shadows. An engineer, looking out from his engine, sees before him all manner of shadows. He is sure that the dark shadow across the track he sees is a man or a rock, or some kind of an obstruction. He doesn't know, and he is kept in a state of nervous excitement all the time. Going around curves, along hillsides, many curious shadows are outlined on the track, and very often an engineer is so worked up over a night's ride that he is scarcely able to perform his duties."

**CARRIAGES IN CHINA.**—A paragraph is going the rounds to the effect that the Emperor of China has ordered a carriage in this country, the implied inference being that they have hitherto been unknown in the Flowery Kingdom. As a matter of fact, as far back as the days when Lord Macartney went on embassy to that potentate, he took with him English carriages as presents from Great Britain. They were found still unused in the summer palace when it was looted by the French 20 years ago.

**A BASTING MACHINE** capable of doing the work of 25 girls is being used experimentally by a large clothing firm in Boston, and the Knights of Labor are giving it their attention.

**UTILIZING ESCAPING GAS.**—It is reported that the natural gas escaping from the mains in Pittsburg is to be used in illuminating the streets.

## GOOD HEALTH.

## Sunstrokes in California.

**EDITORS PRESS:**—In an article in your paper of recent date there was some speculation in reference to the cause of sunstrokes that have occurred in California during the past summer. Now, it occurs to me that the cause of these sunstrokes will be found in the fact that thunder showers have been so much more frequent this season than in previous years. These thunder showers, wherever they occurred or wherever there was cloudy, damp weather, during which they were likely to occur, produced exactly the same kind of an atmosphere that causes sunstrokes in the Eastern States. I think that if the facts are ascertained, it will be found that in every instance where these cases of sunstrokes have occurred there existed a humid state of the atmosphere, which has been so much more common during this season than during previous years. H.

Covelo, Aug. 28, 1886.

**FATAL EFFECTS OF ALCOHOL.**—According to Dr. Richardson, alcohol cuts down by disease, in England and Wales alone, 1000 persons a week. What, adds the doctor, if any other cause of mortality did the same? What if 1000 persons per week died, in the same area, from the bite of the rabid dog or the snake, by the swallowing of arsenic, opium, or prussic acid? What if some thousand persons a week were known to be killed by the secret devices of the slow poisoner, who, under the guise of friendship, went about and instilled into his victims some subtle drop which led to the shortening of their life and to the production of lingering organic fatal disease? What, indeed, then would be the cry and the action? Why, all through the ranks of the great profession of medicine there would be a tumult of labor and toil, such as never before was seen, to remove the calamity. Men would be ambitious to be first to discover by experiment, by experience, the cause of so fearful an evil, and to remove it instantly; while he who won the victory over the calamity would be extolled as illustrious, and, crowned with honor, become a household word from among the children of Esculapius. Yet here one single cause making this deadly havoc, a cause well known and easily removable, in spite of its evils and in face of its easy removal, is permitted to remain in sight with a majority of the army of medicine looking on in apathy, pitying us "poor foolish fanatics" who are exercising our limited powers to uproot it, and some, with the rest of the world, so sharing the calamity as to become copartners in the destruction which follows from the participation.

**COCAINE**, which has heretofore proven a useful remedy for such a variety of ills, is now claimed to be a preventive of seasickness. A Russian physician, having occasion to make several journeys by water, claims to have thoroughly tested its virtues in that direction, with

almost magical effect. Several others have tried it under his advice, with equal success. The same physician, M. Manassein, of St. Petersburg, also claims that the drug is an effective remedy for cholera morbus, and thinks it probable that it may also be found useful in cases of Asiatic cholera.

**SALUBRITY OF OUR CALIFORNIA CLIMATE.**—The salubrity of our California climate is becoming quite universally noted. Perhaps the most satisfactory test of its salubrity is found in the number of deaths among children of a tender age. It is among these that the heat and steam-bath atmosphere of an *unsalubrious* climate show their death-dealing power. The unusually hot season on this coast presents a good opportunity for comparing the mortality in this city with that of the East, where there has yet been apparently nothing more than the usual summer heat. In San Francisco, the hot days of summer are usually confined to three or four, when the thermometer stands at 90° or above. But this year we have had a long period of warm weather, during which the usual fogs and cool winds of summer have been absent. But the records of the Health office show that during one of our recent hot weeks there were only 78 deaths, and of these only 22 were of children under 5 years of age. The death rate for all classes was only .24 per 1000. In New York, in the corresponding week, there were 111 deaths, of which 683 were of children under 5 years of age. These deaths, therefore, of children under 5 years were, in New York, 61 per cent of the whole, while in San Francisco they were only 28 per cent. The death rate of all classes in New York was .74 per 1000, and for children under 5 years of age .45 per 1000. This shows the mortality of all classes in New York to have been three times greater than that in this city, while the mortality of children under 5 years of age was nearly six times greater. It is not probable that any other large city in the United States can make so good a showing during the summer months as San Francisco has during the warmest season that she has experienced for many years.

**VARIETY IN FOOD.**—Often a sickly, waning appetite can be stimulated by some exceedingly simple change in the commonest articles of daily food. Slices of dry bread are uninviting, but the same bread, lightly browned, with a delicately poached egg resting on the crisp toast, becomes altogether another item in the bill of fare. Cold beef and mutton have become standard dishes for wash-day or other slim dinners, but an accompaniment of pickles for the one and jelly for the other makes all the difference in the world between tasteful and barely utilitarian housekeeping. Oatmeal porridge is a most excellent breakfast dish, yet it is well to occasionally substitute in its place berries or other fruit, or even a change to pearl hominy, or cracked wheat, or cornmeal mush. I know there are 40 different ways in which to prepare potatoes, and should not be surprised to learn that there may be 50, yet how few are the tables, especially in the country, where one sees this vegetable except in the stereotyped boiled whole, mashed or fried. A great variety of delightful dishes can be made with apples at all seasons of the year, whether one has fresh or canned fruit. Breakfast, dinner or tea need not lack a healthful relish if one has a dozen or so of apples within reach. I do not enumerate the host of what are known as "made dishes," which can be so quickly and easily concocted out of remnants. I know it is worth the trouble to set on the family table, not courses of elaborate dishes, but a wholesome, agreeable and yet economical diversity of food.—*American Agriculturist*.

**SUCCESSFUL TREATMENT OF SCIATICA BY MASSAGE.**—Prof. Max Schuller, of Berlin, is convinced of the superiority of massage over other measures employed in the treatment of sciatica, and relates his experience of 15 cases—all in males, and except in one or two instances due to exposure to cold. Most of the cases were dealt with from the first by massage; but in a few instances electricity, vapor baths, etc., had been fruitlessly employed prior to coming under his care. The *modus operandi* is as follows: The patient lies on the unaffected side, with knees and hips slightly flexed. The course of the sciatic nerve is rubbed from below upward, partly with both thumbs, partly with the ball of the little finger or thumb; sometimes struck with the closed fist, sometimes the muscular mass over the nerve pressed and kneaded with both hands. The pain evoked by these manipulations soon passes away, and after a short time becomes less and less at each sitting. The neuralgic pains very soon abate, diminishing after a severe and painful massage, then recurring with less severity, and gradually disappearing entirely. The power of walking improves after each sitting. On an average the treatment lasts about two weeks and a half, but in one case nine days, and in several from 10 to 14 days, sufficed. One patient abandoned the treatment after five days, owing to the pain caused by it, and tried, without relief, a fortnight's course of electricity and vapor baths; he then returned to the massage treatment and was cured in two weeks and a half.—*Lancet*.

**FATALITY IN MINING.**—In England in coal mines alone, since 1851, over 36,000 lives have been lost, and during the last 10 years upward of 12,000 lives have been lost, giving an average of more than 1200 a year.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**REPAIRING SHAFT.**—Amador Ledger, Sept. 2: The repairing of the Zeile shaft is about completed, and it is expected that the mill will be started to its full capacity in a few days. At the Kennedy the framework of the new 40-stamp mill is going up rapidly, but it can hardly be expected to be in running order before November.

**SUTTER CREEK.**—Cor. Amador Ledger, Sept. 2: The work of taking out the pump and stripping the Eureka shaft is progressing as rapidly as possible. The track is about all out, and the pump is nearly all on the surface. The prospect of any more work being done anywhere on the premises is not very encouraging. Rumor has it that everything will be offered for sale in a few days, which, if it proves true, means the abandonment of the property.

## Butte.

**BIG BEND TUNNEL.**—Butte Record, Sept. 3: It is reported that men are engaged enlarging the Big Bend tunnel. A flume has been constructed to convey the waters of the river while the work in the tunnel is going on. The flume is 1007 feet long, 18 feet wide and 3 feet deep, and will carry 18 inches of water at the rate of 10 feet a second.

## Calaveras.

**THE GOLD CLIFF'S NEW MILL.**—Mountain Echo, Sept. 1: It is said that the Gold Cliff Mining Company is making the necessary preparations for erecting a 60-stamp mill on Angels creek, several hundred yards from where the mine is located. The mill is to be run by water power, and the company will have the advantage of free water the greater part of the year. This project will necessitate the employment of many more men than are at present required. The Gold Cliff has been well tested of late and found to be a valuable property, warranting all the improvements in view of construction.

## Inyo.

**KEELER.**—Register, Sept. 3: A brief visit to Keeler and the valley generally shows that section to be apparently quiet. But there is much that doesn't show boldly, but in the end will count solidly. Darwin, Cerro Gordo and lesser points are all doing something in the mines; at least half a dozen teams are kept busy hauling ore to Keeler. Steady shipments are being made. Luce's marble quarry is being worked by a small force. Mr. Wrinkle, superintendent of the soda works, has been away lately; in the meantime, however, the work of excavating the vats is going on; and the enterprise, it is hoped, will soon develop into an assured success. There are some idle men at Keeler, but cash appears to be plenty.

**MAXIM.**—The Maxim mill is running at present, it having started up last Saturday. A side track has been laid from the C. & C. main track, thus saving rehandling the ore at the mill.

**RAILROADING VS. TEAMING.**—Enterprise, Sept. 3: The experience of H. G. Chickering in shipping ore from Panamint to San Francisco is a good illustration of the value to a mining country of a railroad. From Panamint to Keeler, a distance of 72 miles, cost per ton hauling, \$20. From Keeler to San Francisco, a distance of 575 miles, cost per ton by rail, \$10. If hauled all the way at the same rate, the cost would be about \$148 a ton, therefore not a pound of the ore would ever be taken out of the ground. This ore is what is known as "dry" ore; that is, it carries very little, if any, lead, and to be worked must be mixed with ore that has a surplus of lead, or must be dry crushed in a mill. This is why it must be shipped to San Francisco, or held until the mill at Panamint shall be ready.

## Mariposa.

**MACHINERY FOR THE MINES.**—Gazette, Sept. 4: W. T. Turner, of Hornitos, passed through town yesterday with his teams and several wagons loaded with machinery, including a large compressor for the Vanderbilt mine. This looks like business, and it is to be hoped that the enterprising owners will realize their fullest anticipations. The mine is extensive and contains an inexhaustible supply of quartz which the present owners have prospected. Taking into consideration the great amount of work done preparatory to permanent operations, the owners must be well assured of the richness and character of the rock to make further expenditures and improvements, as present appearances would seem to indicate.

## Nevada.

**GOOD CLEANUP.**—Foothill Tidings, Sept. 2: A crushing of 14 loads of rock from the Defiance ledge (old Merrimac) was cleaned up yesterday at Rodgers' mill, yielding, not including sulphurets, \$38 per load. L. Payne & Co. have leased the mine for one year, and are making first-rate progress in the work of development. The ledge looks well and there is great promise of a fine mine there.

**A STUPENDOUS ENTERPRISE.**—Transcript, Sept. 2: D. R. McKillican owns a tract of several thousands acres of placer mining ground lying above North Bloomfield between the South and Middle Yuba rivers. The same gravel channel that is being worked at North Bloomfield and Durbec is supposed to extend through this ridge, under the surface of which the bedrock lies at a depth of from 400 to 600 feet, preventing its being worked at reasonable cost by the hydraulicking process or by sinking shafts. It is to be developed by tunnels, one of which is being run from the Middle Yuba at Snow Point. Within the past four or five years two others have been put in from the South Yuba slope at a point in the vicinity of the old Roscoe ranch. Several thousand feet of tunnel will have to be dug to determine the extent and richness of the auriferous deposit, and if the results are as favorable as the present indications appear to promise, the most extensive drift mine in the State will be opened up.

## Placer.

**THE RISING SUN MINE.**—Herald, Sept. 4: The Rising Sun & Big Oak Tree mine, at Colfax, is now

running in full blast. Between 50 and 60 men are employed, and the mill has been busy lately crushing some of the low-grade ore; but the mine is now down 175 feet where the ledge averages 15 inches in width, and the rock will produce from \$40 to \$50 a ton. Some splendid specimens of quartz, showing free gold, and masses of sulphurets, have recently been taken from the mine. The new hoisting works are now completed, and add materially to the facilities for working the mine.

**GRAVEL MINE ATTACHED.**—We understand that C. Hudspeth, of Dutch Flat, has sued and attached the Liberty Hill Con. Mining and Water Co., to recover \$5776.54 due on promissory notes. There are several attachments on the property, but it is supposed, or at least hoped, by the creditors that enough will be realized to pay all outstanding indebtedness.

## Plumas.

**ARCADIAN MINE.**—Greenville Bulletin, Sept. 1: The Arcadian mill started Tuesday on custom ore from the mine of the Forest King Co. It is expected that the mill will run as long as the roads will admit of hauling over them before winter begins, as the Forest King mine now shows a large quantity of good milling ore.

**CRESCENT MINE.**—The water in the shaft of the Crescent mine has been successfully removed, and further sinking will be immediately commenced. The bottom of the shaft looks exceedingly well, and under the energetic management of the present superintendent, Mr. A. L. Whitney, we hope soon to see the mine resume its old-time place among the producing properties of this locality.

**INDIAN VALLEY MINE.**—The works of the Plumas Con. Co., at the Indian Valley mine, present a scene of much activity. The recent development of the Union chimney, by a drift west from the main shaft, is showing some fine ore and in sufficient quantity to enable the mill to be mainly supplied from that point. This reopening of the Union with the Indian Valley proper virtually adds another mine to those now being worked in this district, and outlines a brilliant future for the property of this company.

**GRANITE BASIN.**—Plumas National, Sept. 3: Messrs. Rockfellow & Wright, of the Granite mine, have completed their overshot wheel, and will be ready to start up the mill next week. They have also built a tramway from the mine to the mill, a distance of 600 feet, which will do away with the expense of hauling the quartz by team, and enable them to run during the winter months. The mine is being opened in a workmanlike manner, which shows good judgment and sound sense as to the advantages to be obtained in future working of the mine. The ledge is on an average about two feet in width, and the quartz is easily extracted, and timber and water are abundant for all purposes. The quartz already tested yielded \$18.00 per ton, in free gold, and with a concentrator and grinding pan, which they expect to add to the mill, the yield will be greatly increased, as the gold is rusty, and the sulphurets are very rich. Mr. A. Swan is taking out some very fine ore at the Homestake mine. The ledge in the lower tunnel makes a good showing. Mr. Groves is making a test run from the Flowerpot mine, which, from present appearances, will be satisfactory, and another mill will be needed. These hills are full of mines that will pay if worked judiciously by individuals that are willing to put their shoulder to the wheel, and will pay far better than farming.

## Shasta.

**LOWER SPRINGS MINES.**—Cor. Democrat, Sept. 1: The great mineral belt lying west of the Sacramento river is, no doubt, the most extensive in this part of the country, and the least capital has been expended upon the veins of any camp in the State. Why this is so is a mystery to practical miners. If mining men would properly investigate these mines they would certainly be well pleased with the prospects. This camp is fast showing up its rich mineral resources. Many very good prospects have been found here of late. The Muchmore mine is now turning out excellent ore. The owners are not at all anxious to part with their property, as they have as much in sight or more than they ask for the property. They are making preparations to work the mine themselves, and have faith in opening up something better than they have already found. The White Oak and Eastern Star mines are yielding ore that will pay for hand mortaring. The Bulkhead mine, lying to the east of the Muchmore mine, and supposed to be the same ledge, is being tapped with a tunnel at right angles, which will strike the vein 50 feet from the surface. This mine has produced splendid ore. The Rockford, known as the Jones mine, is having a shaft sunk 15 feet west of the old shaft sunk 20 years ago, and some very fine ore has been extracted. In early days 100 tons of ore from this mine yielded \$22.25 a ton, besides some assorted ore milled \$500 a ton, and the greatest depth obtained is 35 or 40 feet. This vein is pitching south at an angle of 45°. Hargrave mine has a shaft down 35 feet on the vein, and shows good milling ore. The ledge is large and pitches a little north. There are several fine prospects on patented lands, but this will not induce prospecting on these lands, for the owners will not give a reasonable percentage to the prospector. This, of course, is a detriment to the camp. The best ore we have here is ribbon quartz. Where gold does exist here in this character of quartz, the gold and sulphurets increase as depth is attained, and the veins hold a more uniform thickness. The miners here are striving hard to develop their mines, but cannot do much for the want of a good mill. There is a very poor show for tunneling here, as the ground is rather low, and sinking shafts is expensive, as extra help and pumping is required to handle the water; nevertheless, we will hang on to our claims to the last.

## Sierra.

**GIBSONVILLE.**—Mountain Messenger, Sept. 4: Tabor Co. will resume operations in a few days running its main tunnel, in now 2300 feet, and expect to strike through to pay gravel in about 200 feet. Gravel Hill Co. is putting a tunnel through bedrock, and thinks it will ere long tap the back channel. The Union Co. is putting down an incline for new ground. Elias Squire and his father are still engaged in mining, and are developing new and valuable property. C. O. McQuesten is, as of yore, at the North American drift mine with the Schofield Bros.

**HOWLAND FLAT.**—This noted mining burg, usually buried up with snow during the winter months, at an elevation of over 5000 feet above the sea, though rather quiet just now, has bright prospects of a prosperous future, when the extension of the rich auriferous ancient river channel, part of which has been so profitably worked in and near Howland Flat, shall have been reached northeast up the ridge, toward and through Mt. Fillmore. Lincoln and Virginia Companies are in about 1700 feet from daylight, 1600 feet of which is an air-line, about two-thirds of the distance being in hard, blasting rock. With two shifts, of 10 hours each, they make eight feet a week through what is evidently the rim. Soft bedrock or gravel may be struck most any time. But 350 feet northeast, the Virginia Co. found soft bedrock and pay gravel overhead, and was obliged to temporarily cease work for lack of funds, and afterward was convinced that this new passageway to the gold lead was the shortest and most practicable. It is believed, with good reason, that the extension of this rich auriferous ancient river lead, part of which has been worked by the Union, Pittsburg, Hawkeye, Monumental, Empire and Bonanza Companies, continues up to and through the ridge to Mt. Fillmore and the west branch of Canyon creek. When this valuable mining ground is fairly opened for thorough development, Howland Flat may once more have an era of prosperity unequaled in her past brilliant history. Gibraltar Con. Co. has got out a lot of timbers, and will soon resume work on the tunnel to run 300 feet ahead to tap the shaft where pay gravel is expected. Good paying gravel is expected to be struck soon in the Mt. Fillmore claim. Howland Flat mine, under Mr. Denoon as foreman, has not kept even this year, but it was not his fault. No one mined at Pine Grove this summer but D. Conlan, and it is reported that he has done well. The St. Louis mines, under Mr. Donahue, have made a fair profit. Pioneer mine, at Grass Flat, under control of Geo. W. Cox, receiver, has yielded fairly well this year—over \$30,000. The hydraulic companies from Grass Flat to Gibsonville have paid out for labor this year over \$40,000—to white men, \$30,000; Chinamen, \$10,000. This shows a large percentage in favor of the former. All the white help that could be obtained has been given steady and profitable employment.

**BULLYCHOOP.**—Courier, Sept. 4: The sale of mining property in Bullychoop district has been consummated. Messrs. Potts, Finch & Robinson dispose of their interest in a group of mines there, C. F. Foster retaining his interest. Captain Potts retains his ownership of the toll road, George N. Cornwall and other gentlemen of Napa are the purchasing parties. Captain Potts, Robinson, Finch and Foster still own a couple of mines which were not included in the sale mentioned. It is understood that a capital of from \$75,000 to \$100,000 will be expended on the newly purchased mines. The development of Bullychoop and Sunny Hill districts will prove a great boon and a big boom for Western Shasta and Anderson, which is the railroad shipping point for these mines.

**FIFE'S MILL.**—Andrew Fife's quartz mill, which has been in successful operation on Spring Creek, will be removed to the east side of the Sacramento, about 150 yards from the site of the old Chauncey bridge and proposed new bridge, where it will be set up in remodeled shape, and in first-class order. The water needed in operating the mill will be taken from the Spring Creek ditch, and run across the Sacramento in iron pipe. The development of mines on the east side justifies Fife in making this move, and he has put in a boat to facilitate work.

## Tehama.

**MORE CHROME.**—Red Bluff People's Cause, Sept. 3: Job Comings and Frank Brotherton, of this place, have made a discovery of a fine chrome deposit in the Coast Range, upon which they have located four claims. An assay shows 58 per cent oxide of chromium and 1 1/2 per cent peroxide of iron. The deposit is extensive and of fine quality, yielding chrome yellow, blue, green, chocolate and a beautiful red. There is also in the vicinity of this deposit of chrome protoxide of barium, yielding a snowy white, which is also of considerable value. This is the second discovery of chrome within the past few weeks in the foothills and mountains of the Coast Range, besides other ores, the characters of which have not yet been made known by assays. Samples of these are still under examination by experts, showing that the mineral wealth of Tehama county has not been half told.

## Tulare.

**MINERAL KING.**—Visalia Delta, Sept. 2: We had a fine shower of rain here Sunday, Aug. 29th, that completely laid the dust for a short time. The mines here are booming, especially the White Chief and old Baigalupi claim, though the White Chief had a rest for a few days. The party that contracted to sink the shaft 100 feet has departed for Iowa. It is said that he was a coal miner and contracted to sink the shaft at the rate of \$12 per foot; and, having sunk a little over 40 feet, found out that he was losing money, and that rock mining was a little harder than coal mining. It is reported that Harry Trauger has now taken the contract to sink the shaft, and the mine is booming again. Prospectors that are at present working their assessments are finding some fine-looking ore, and we expect a boom here next summer, if not before.

## NEVADA.

## Washoe District.

**BEST AND BELCHER.**—Enterprise, Sept. 4: On the 600 level west crosscut No. 1 has been extended 31 feet, making a total of 214 feet, passing through a vein of quartz during the week 12 feet in width, looking finely but assaying poorly. Crosscut No. 1 east on the same level has been extended 45 feet, making a total of 168 feet—material, vein porphyry with streaks of quartz. The heavy stone bulkhead in the north drift from the Osborn shaft, on the 2500 level, is completed, and as soon as the cement is sufficiently hardened the water gate will be closed. This will effectually shut off the heavy flow of water coming from the northward, and materially decrease the amount of pumping work hereafter. Sinking the shaft deeper will be next on the program.

**ALTA.**—On the 700 level the drift south from the main west crosscut is being continued, following the east wall of the Keystone ledge. It is now in Alta

ground again. The main north lateral drift on this level passed to the westward of the old Lady Washington shaft, and now a drift is being run to the northeast from its face, beyond the Lady Washington shaft, to cut an ore body known to exist in that direction. Some months ago, on this same level, two short crosscuts west in the north half of Alta ground, cut through a very promising vein of good pay ore, 15 or 20 feet wide, which evidently extends all along the west side of the main north lateral drift. Good results are anticipated from crosscutting this as well as the Keystone vein shortly.

**CON. CALIFORNIA AND VIRGINIA.**—Last Tuesday, owing to the reduced state of water in the Carson river necessitating a partial suspension of operations at the Eureka mill and a corresponding decrease in the ore supply, 60 miners were drafted from the working force of the mine—30 men from each shaft. This arrangement will have to continue until more water flows down the arid bed of the Carson. The daily yield of the mine is now less than 150 tons principally from the lowest working levels, the average assays from mill battery samples being about \$16 per ton. The exploration and development work on the 1300, 1400 and 1650 levels goes actively ahead, with good prospects at each point.

**CHOLLAR.**—The repairs to the Cornish pump-rod in the Combination shaft being completed, the pumps were started into active operation again on Tuesday. The water had raised to the top of the station of the 3200 level, completely submerging and stopping all operations on that level, but it was soon reduced to where it was before in the sump below the level. The south lateral drift has been cleaned out and work resumed in its face, for further advancement southward along the east side of the vein.

**SAVAGE.**—On the 600 level, development and exploration work goes actively ahead, with a continued fine showing of ore to the southward, as well as in the crosscuts west. On the 800 level considerable work has had to be done in retimbering and repairing, and the lateral drift south is being pushed ahead in good vein material, to intercept the rich ore vein thought to extend downward from the 800 level.

**HALE AND NORCROSS.**—Work on the 3200 level, which was suspended by reason of the repairs to the pump in the Combination shaft, has been resumed. The water rising and submerging this level caused a little caving at the deep winze station and some repairs to the lagging, timbering, etc., as well as some clearing up of debris. A better report of progress will be made next week.

**POTOSI.**—On the 3100 level a station is being cut out for another diamond-drill hole east, 220 feet north of the last drill hole, No. 7. This is properly in Chollar ground, being 500 feet south of the Hale and Norcross' south line; but the work is being done by the Potosi Company in exploration of the great quartz vein lying to the east and extending south through both mines.

**CROWN POINT AND BELCHER.**—The repairs to the incline engine are completed, and work was to have been resumed in both mines on the 1st inst.; but owing to the very low stage of water in the Carson river not furnishing the requisite motive power for the mills, it was deemed advisable to defer further ore extraction for the present.

**GOULD AND CURRY.**—On the 450 level an upraise has been made from north lateral drift No. 1 to the height of 42 feet, exploring a promising point. It is in low-grade quartz thus far. It is 150 feet north from the main west drift. The west crosscut No. 2 from the north end of the lateral drift No. 1 has been advanced 36 feet; total length, 64 feet.

**OPHIR.**—On the 1300 level the south lateral drift is advanced to the distance of 335 feet, showing good vein porphyry formation with a little quartz. On the 1465 level the southwest drift is 150 feet in length. Material, vein porphyry with considerable quartz and clay seams.

**SIERRA NEVADA.**—On the 520-level crosscut No. 3 west, recently started from near the face of the north lateral drift, has been advanced 50 feet, making a total length of 79 feet. Material, vein porphyry with a little quartz.

**YELLOW JACKET.**—Daily yield, 100 tons, which is all that can be produced without overcrowding the Brunswick mill, with the present low stage of water in the Carson river.

**MEXICAN AND UNION.**—The exploration work on the 700 level, drifting north and crosscutting west, makes good progress, showing promising vein material.

**MONTE CRISTO.**—Work confined to running the main drift west on the 150 level from the new shaft to the ore vein.

**KENTUCK.**—The regular daily yield of 40 tons continues of low-grade ore from above the 800 level.

**OTHER MINES.**—Work is resumed in the Utah and Occidental mines, and it is reported that work is also to be resumed in the Andes mine shortly.

## Aurora District.

**AURORA ASSAYS.**—Walker Lake Bulletin, Sept. 1: The Esmeralda Con. Co. is vigorously prosecuting work upon the Durand and Juniata. In the Durand a winze is being sunk from the tunnel level; some of the ore is very rich, and the ore body is widening, and the prospect is that it will lead to a large ore chamber of rich ore. "85" mine has an increased force of 11 men at work; three wagons are employed in hauling the ore to the Miners' mill for reduction. The last cleanup was very satisfactory. Work is being diligently prosecuted on the large drift in the Antelope mine; the ledge will probably be cut in about 20 feet. Mr. F. M. Smith, a capitalist of San Francisco, and largely interested in the Silver Lining mine, was here on the 27th ult. He visited the mine with a view of starting work upon it and of employing the Silver Hill mill near the mine for the reduction of the ore.

## Columbus District.

**MOUNT DIABLO.**—Candelaria True Fissure, Sept. 4: The incline is now 102 feet below the 8th level, and the formation is rather more favorable. We are sinking on some low-grade ore in the intermediate between the 5th and 6th levels. The raise from the intermediate between the 4th and 5th levels is up 30 feet, and the south crosscut from this raise is in 8 feet.

**CANDELARIA WATER-WORKS AND MILLING.**—The mill resumed crushing Georgene ore Wednesday.

day morning. The furnaces are working better than before. The grading for hoisting works at the Georgene has been completed. The lumber has all arrived and the carpenters have begun framing the timbers. The force of miners is being gradually increased.

**POTOSI.**—The lessees are taking out ore from the first ledge and prospecting the second. There are about 20 tons of ore on the dump that will assay about \$150, and it will be shipped as soon as silver is worth anything. Besides that, there are about 20 tons of \$50 ore that will be offered to the Candelaria Water Works and Milling Company (Limited).

**GLADSTONE.**—It is the intention of the owners of this Lone Mountain property to make a shipment of ore. Thomas Edwards has gone out to the mine to superintend the work. He has with him Joe Wells and Cy. Reed, both of whom are experienced miners.

#### Dun Glen District.

**CHINESE WORKING PLACER CLAIMS.**—*Silver State*, Sept. 4: William Nelson, who was over from Dun Glen yesterday, says there are about 60 Chinamen working placer mines in Barber canyon, and several more are at work in Auburn canyon. They wash the gravel with rockers, and, notwithstanding the scarcity of water, continue steadily at work. They do not tell what they make to the hand, but the gravel must be rich to pay anything the way it is worked.

#### Eureka District.

**JACKSON MINE.**—*Eureka Sentinel*, Sept. 4: Quite active prospecting work will be done shortly in the Jackson mine on Ruby Hill. Supt. Powell is advertising for sealed proposals to run a 4½x6½ foot drift on the 200-foot level of the property. The mine is looking well, and the output of ore during the coming month promises to exceed that of any like time in the present year. The Jackson is a dividend-paying and, to a great degree, a "virgin" property. The stock, though listed, is held principally by a few parties in San Francisco.

#### Gillis District.

**THE BURNLEIGH REOPENED.**—*Walker Lake Bulletin*, Sept. 1: The Burnleigh mine, in Gillis district, has been reopened and already a quantity of rich rock has been taken out. Wilkinson and Kennedy have acquired the title and are in a fair way toward making it a very profitable piece of property. They are both experienced miners who do their own work, and the prospect is excellent. The ore from this ledge is frequently extremely rich, and they can, with ordinary good luck in discoveries, stand the discount on silver and still make a handsome profit.

#### Ophir Canyon District.

**CHICAGO CO.**—*Reese River Review*, Sept. 2: D. H. Jackson has resigned his position of superintendent of the Chicago Mining and Reduction Co., at Ophir canyon, in order to pay attention to other matters which command his attention. Thos. A. Oliver is his successor. Mr. Oliver is the present foreman and is a thorough miner and a competent gentleman.

#### Wild Rose District.

**STRIKE IN THE GINTZ MINE.**—*Silver State*, Sept. 1: J. W. Jackson, who arrived yesterday from Spring City, tells a *Silver State* reporter that excellent ore has been found in the Gintz mine at that place. This mine is situated across the canyon from the Paradise valley and is supposed to be a continuation of that valuable mine. Mr. Gintz recently disposed of his interest in it to W. P. Todd-hunter, and a few days' work developed a body of good ore.

**ORE SHIPPED.**—*Silver State*, Sept. 4: E. Reinhart & Co. shipped a car-load of ore from the Paradise valley mine to Argo, Colorado, yesterday.

**BULLION TAX.**—County assessor Riley paid into the County Treasury yesterday \$1107.58, tax on the net proceeds of the Paradise valley mine for the last quarter. The Paradise valley is the only mine in the county at present that pays any tax.

#### Willow Creek District.

**ARASTRA WORKINGS.**—*Cor. Silver State*, Sept. 2: The depression in the silver market has so affected its production here that developments are not being made of sufficient importance to justify notice in your columns. Nevertheless, hoping against hope for a reaction, the proprietors of a few claims still continue operations, notably the Ohio and Iowa mines. As you are aware, some washed gold has been found in all of the gulches and canyons hereabouts, and this fact has led all the real energetic bone and sinew of the camp to prospect for gold quartz. These efforts have been attended with what I regard as complete success. A number of gold claims have been staked off, several arastras built, and considerable rock worked by that process. I am not at liberty to state the net results of these workings, but they were so satisfactory that none of these claims are for sale. The boys are living on the fat of the land, and swear by the arastra process. I hope to be able to give you facts and figures in the near future.

#### ARIZONA.

**METCALF AND LONGFELLOW.**—*Clifton Clarion*, Sept. 2: Work at the Metcalf mine is progressing favorably under the management of Capt. Kelly. The ore is turning out well and in good quantity. A large amount of low-grade ore which has been on the dumps for some time past is now being shipped to Clifton and run through the concentrators with highly favorable results. Some sickness is prevalent at the Metcalf, but there are no serious cases. At the Longfellow everything is running along as usual, and the regular shipments of ore to the smelter are being made. Mr. A. B. Ferrie has been doing quite an amount of work in the way of surveying about the mine of late, and we understand will shortly proceed to the Metcalf for the same purpose.

**GROOM, CREEK.**—*Prescott Courier*, Sept. 1: Twenty-six and one-half tons of gold rock from the Kelly mine, Groom Creek district, was recently worked in the Aztlan mill by Chris. Linde, with the following result: Free gold, \$283.85; silver, \$6.35; 1½ tons of concentrations worth, at least, \$200; total, \$490.24. Concentrations may run higher. Mr. E. Stahl has made a nice bar of the bullion. Chris. Linde does not pretend to be a millman, but

his work proves that he did better than some "mill-men." A new shaft was recently driven in the vein, 200 feet from the old workings, and the ore body is large and well defined. In the same district Mr. Lambert has bonded the Black Hawk and Gray Eagle mines, from Rupert & Son. Shafts will immediately be sunk and a 10-stamp mill erected. The mines are near the north fork of Groom creek, about six miles south of Prescott. Messrs. W. A. Rowe and A. J. Park, of Hassayampa district, came in yesterday. Park tells of a pretty good strike by Mr. Schofield, of Big Bug, and Mr. Rowe believes the Davis is a great mine.

**TOMBSTONE.**—*Epitaph*, Sept. 3: The Grand Central mill will probably start up about the 15th, on tailings and Emerald ore, eight pans being run on tailings and eight on ore, all of which will be concentrated after leaving the pans. There is enough tailings on hand to run eight pans from two to three years.

#### COLORADO.

**RAISING WATER.**—*Georgetown Courier*, Sept. 2: David Hill's process for raising water from shafts is in operation in the Lebanon tunnel. The plant is placed over the shaft, on No. 5 lode, with a small engine attached, which is run by compressed air. When in operation it is stated that a stream of water two inches in diameter is easily thrown to the surface from a 75-foot shaft. Mr. Hill has applied for a patent for his invention, and when it becomes known it will probably take the place of the different mining pumps now in use.

#### DAKOTA.

**MINING NOTES.**—*Black Hills Tribune*, Sept. 1: It is said that two feet of steel galena has been cut in the Big Chief tunnel. The mine is located near the head of Little Strawberry gulch, about a mile and a half from Whitecloud. It now appears that the Iron Hill smelter was not stopped on account of any breakage to the engine, but because of its freezing up. The Sitting Bull mill is being renovated, and it is expected that operations will soon commence in that camp which has laid quiet so long. Work is soon to commence on the Richmond mine.

#### IDAHO.

**WOOD RIVER.**—*Ketchum Bulletin*, Sept. 1: The leasers have stopped work on the King of the West until hoisting works are put up, when they will resume work again. Joe Montgomery has gone to work on the Smuggler, which has every indication of becoming an ore-producer in the near future. A small shipment of Maud and May ore has been sampled at the Ketchum Sampling Works this week. Other shipments will soon follow. The leasers on the Niagara mine have six tons of ore sacked and ready to ship. Ore is being taken out every day and the mine promises good returns for the leasers. Work is progressing in the new tunnel on the Irving mine by the leasers. Ore in small quantities has been found, but the main vein is expected to be struck in a short time. The King of the West mine, Smoky, continues to take out large quantities of fine ore, and the ore bodies get larger and richer as they go down, but the great drawback is machinery. B. X. Boone returned from a two-weeks' prospecting trip over on Lost River yesterday. He says the mining outlook in that section is most encouraging. He located a claim near the Star of Hope mine, on which he found good ore croppings in several places. The Alva mine, Warm Springs creek, is showing up finely. A new tunnel is being run to tap the vein under the old workings. It is now in 130 feet, but will have to be run 30 feet further before an upraise will be started. The upraise will be 80 feet to strike the old works. Good ore was found in the old tunnel, and it is expected the upraise will be cut through an ore body. The new tunnel is now in ore-bearing rock.

**THE KING OF THE HILLS.**—*Wood River Times*, Sept. 3: Superintendent Gibbons, of the King of the Hills, came down from Bullion today, to look after the sampling of a 20-ton lot of ore. It went 60 per cent in lead and 140 ounces in silver. Mr. Gibbons says this ore was run against in driving a portion of the 600-foot tunnel which is running for the main Eureka vein. He will begin making regular shipments ere long.

**SMOKY NOTES.**—George Montgomery came in yesterday from Smoky, and went on up to Ketchum today, intending to return to his King of the West mine by the way of Warm Springs creek. He reports the King yielding large quantities of second-class ore, and just about enough first class to pay expenses and keep the owners in fairly good humor. The Carrie Leonard is a good mine; the Stormy is looking well; the Silver Star and Smoky-Bullion are likewise, and Smoky will probably poll between 150 and 300 votes this fall.

**ONE MAN'S DOING.**—S. J. Friedmau and Jos. K. Morrill visited the Lucia Company's mine, on the east fork of Wood river, a couple of days ago, and were shown through by Theo. Olsen, who owns a fourth interest, and has done all the work himself. There are three tunnels in the mine, one 250 feet, and the others about 90 feet long, each; there is also a shaft 20 feet deep, and quite a length of drifts. Mr. Morrill says that there is a considerable quantity of low-grade ore in sight, and that track, blacksmith shop, etc., are "neat as wax." He never saw so much work done by one man before.

**EAGLE CREEK.**—*Coeur d'Alene Eagle*, Sept. 3: Placer work on the east fork of Eagle creek is not entirely suspended for the season. Ellensburg is deserted, however, and the only work in progress on the creek is about a mile and a half below there, where Jack Reinhart and two partners are putting in a bedrock flume. They have whipsawed 3000 feet of lumber this season, and have quite a long line of boxes in place. Bedrock has not yet been reached, but sufficient pay has been obtained in the gravel to meet expenses.

**ROCKY BAR.**—*News-Miner*, Sept. 1: Work on Ada Elmore, at Rocky Bar, is being vigorously prosecuted by the Alturas Gold Mining Company, under the superintendency of Capt. Beckford Anthony. The grading and leveling for a 50-stamp mill, with capacity for 100 stamps, is going on as fast as possible. Casey, Holland & Co. have contracted to furnish 4000 feet of lumber for the mill and out-buildings. The mill is already on the road, and the

superintendent expects to have it running by the middle of November. The ore vein in this mine is from 4 to 15 feet wide and works on an average about \$40 per ton. The company will employ about 150 men. The old town of Rocky Bar is already beginning to boom, and will be the liveliest camp in the county.

#### MONTANA.

**A RICH STRIKE.**—*Inter-Mountain*, Sept. 1: Several times in the past fortnight paragraphs have appeared in these columns, mentioning the very promising development in the Gold Hill, just north of the courthouse. The mine was leased early in August by Messrs. J. B. Deitrick, Joe Young and James Bannon. The only work that had been done on the property at that time was to sink a prospect hole which had disclosed nothing of a very promising character. But Mr. Deitrick, who is a miner of much experience, not only here but in other mining sections in the Rockies, especially in Nevada, thought he could see something there which had escaped the attention of others, and so on the 4th of August, after a good deal of urging, he got his present partners to go in with him. A week or two ago, after sinking only a short distance from the bottom of the old shaft, they found that the vein matter was filled with chunks of quartz and talc, netted with pure native copper. Further down they got a body of solid quartz and have been working on it since. Assays made Tuesday showed it to carry about 152 ounces in silver to the ton, besides a good percentage of copper and some gold. This condition of affairs continued until about 1 o'clock this afternoon, when a blast laid bare the treasure which Mr. Deitrick had all along believed to be there. The ore carries a large percentage of copper (pyrites and black sulphurets) and is very rich in native silver, the rock being literally covered with it. No assay has as yet been made, but it is safe to say that it will run very high in silver as well as copper. This strike is at a depth of about 60 feet. The property is owned by W. A. and H. S. Clark and N. J. Beilenberg—the first named owning a half and the other two a quarter each.

#### NEW MEXICO.

**ORGAN.**—*Cor. Rio Grande Republican*, Sept. 1: A year ago or more the smelter boom at Las Cruces turned public attention to that point to such an extent that when the smelter was removed from here and erected there, many seemed to think that the Organ mines, the Organ mining camp and the Organ mountains all moved to Las Cruces. But it was soon found not only that Organ mountains stood firm with their treasured ores, but that the removed smelter itself was so embarrassed at its completion that it has stood still and lifeless to this day. I am glad to learn that it has recently been relieved of its embarrassments, and promises to show signs of life at an early day. But what I wish now specially to say is that all this time discovery and development have been silently at work in the Organ mines uncovering the hidden treasure until now there are, you may say, thousands of tons of valuable ore lying on the dump or in sight awaiting orders. And this ore is found not in one or two places only, but in more than a score. The Stephenson has the most, perhaps, but claims like the Bennett, the Little Buck, Memphis, Gerard, Black Quartz and a dozen others, are prominent as yielding valuable ores in quantities for shipment, and of a character fitted for concentration. At the Stephenson alone there are probably 20,000 tons ready for concentration, and it may be truly said that Organ camp is to-day more prosperous and promising than ever before, so far as the development and character of ores are concerned. Now what will be done about it? Shall we have a concentrator added to the smelter at Las Cruces and begin to give shape to this immense mineral wealth at our doors, or shall we still wait indefinitely while millions of wealth thus lies dead and unproductive?

**SOLD.**—*Silver City Enterprise*, Sept. 3: A Kingston correspondent of the *El Paso Times* says it is understood that the Bullion mine has changed hands for the sum of \$112,000, Colonel Lockhart, of Deming, being the purchaser; also that work will be prosecuted. We understand that the Pueblo people propose this fall to start a large branch of their smelting works here in Deming. This is got from reliable information. The large smelting plants are looking for lead mines, carrying silver, and Deming is well known as the pivotal point for such mines.

**COONEY.**—The time is now close at hand when the fulfillment of the promises that have been held out by the mines of Cooney camp must be realized. The beginning of the season of 1886 witnessed a degree of activity among its veins of mineral that attracted toward them the attention of mining men from all quarters. The indications seemed so highly promising that a great deal has been looked for from a class of work done upon the mines that would be more nearly allied to legitimate mining than the surface-scratching, or "prospecting" so called, that hitherto had been the rule or custom. That such work would ultimately prove, beyond a question, the soundness of the views held by those indorsing it, is now fully admitted, and this position is about to receive additional strength from developments just made in the lower levels of the Peacock mine. With a record of over \$80,000 produced from a comparatively insignificant opening along the outcrop of the vein, there was much to hope for from what would follow deeper down on the property. This is now beginning to be made manifest. The principal exploring shaft, now down nearly 60 feet from the breast of the crosscut tunnel, though showing high-grade ore at all times, now gives every indication of near approach to a bonanza that will surpass in every point of excellence any found in the upper or surface workings of the mine. In the breast of the lower level running northwest a new ore body is also being penetrated now. This evidently is a downward continuation of the great ore outcropping, which shows with great strength and continuity at the surface above the point where the breast of the level has reached. Like the ore in the shaft, this new strike in the level promises fine things for the future, and has in store a reserve quantity that can be drawn upon at will. Sample assays made from ore from both the new strike in the shaft and level described average nearly \$100 per ton gross. These strikes will be opened with the least delay, and the addition of their value in ore to what

is already in sight and is now being drawn upon must materially enhance the productiveness and profitability of the mine. For months past a steady production of ore is kept up, and not an hour passes but what is utilized in the mine and mill by the constant output of ore from the one and the production of concentrates from the other.

#### OREGON.

**GOLD MOUNTAIN.**—*Bedrock Democrat*, Sept. 1: Mr. G. W. Tucker, who, since last June, has been working a claim located by him some four miles east of this city, furnishes the following facts in regard to this quite recent discovery: He brought into our office two shot-bags filled with concentrates, reduced by himself, and for which he has an assay, by Mr. Elmer, of our city, presenting the following figures: Number of ounces of fine metal per ton of 2000 pounds, 125.55; viz., gold, 84.96; silver, 40.59; value of gold, \$1736.27; silver, \$52.48; full value, \$1808.75. Mr. Tucker had with him a common long-handled iron shovel, also a small tin one, both of which were used in handling these concentrates, and are covered with a thick coating of gold—a circumstance which Mr. Tucker, who is an old miner, claims to be an unusual one, and its chemical action not easily solved. Notwithstanding the flattering showing given above, if a stranger should make inquiry concerning the mineral wealth of Eastern Oregon, not once in ten would this group of mines, numbering 11 locations, in the Gold Mountain district, only four miles from Baker City, be mentioned. Yet the ore is there all the same, and the day is not far distant when the noisy stamps will remind our citizens that it is no longer necessary to transport the capitalist over miles of rough road in order to show him a paying mine.

**NOTES.**—*Jacksonville Times*, Sept. 3: Prospecting continues everywhere. Alex. Orme has purchased Fred Otten's mines on Footh creek, Orme Bros., of Footh creek, have finished cleaning up for the season, and did well. They picked up a \$16 piece some time since. L. D. Brown & Son are making preparations to put up a new and first-class mill on the site of their former one, near Swinden's ledge. Work on the tunnel to tap C. C. Beckman's mines on Jackson creek is progressing steadily. Some of the machinery for Klippel, Baumle & Co.'s quartz mill has arrived, and the balance will soon be here. It will be in running order before many weeks. J. N. Casteel will finish the Jackson Mill and Mining Co.'s tunnel this week. Progress has been very slow during the past few weeks, as the rock has been quite hard. We learn that the California company, which is about engaging in placer mining on an extensive scale in the vicinity of Kerbyville, has let a contract for digging 17 miles of ditch. The Sterling Co.'s ditch, which was filled with debris for several miles by a cloudburst, is being repaired by quite a force of men, who will complete their work in the next fortnight. Walsh & Bragdon have purchased what is known as Chick's mill, formerly located at Medford, and which is at present crushing quartz from the Hope ledge on Wagner creek. It is said that the results are excellent, and that there is every probability of this mine paying well. We learn that much of the ore pays as high as \$17 to the ton.

#### UTAH.

**SANDSTONE MINING NOTES.**—*Southern Utah Times*, Sept. 1: Kimple & Lewis are still working the Leeds mine. The ore is of low grade and not very remunerative. Bailey & Nesbit have secured a lease on the Bonanza, which they are working in the interest of their leasers. Mutton & Hartman are still chloriding on the Annie. The mine is looking well and they are taking out considerable ore. There is very little chloride ore being shipped to the mills, as the present price of silver leaves but a small margin, the chloriders preferring to hold back and wait for higher quotations. Henry Holling has resumed work on the Silver Gate. The pay streak is about two feet wide, dipping toward the creek. The vein has been struck on the other side, carrying about 20 ounces. In sinking there is a great probability of water being encountered. The recent heavy rains have retarded the running of the Stormont mill. On account of a break in the dam the mill shut down for repairs two days, but it is running again. The Buckeye and Thompson mines are furnishing the regular ore supply.

**WEEKLY REVIEW.**—*Salt Lake Tribune*, Sept. 3: For the 8 months of the present year, excluding all ores, the receipts of bullion in this city have been as follows: January, \$328,852.66; February, \$456,024.03; March, \$469,722.63; April, \$519,666.08; May, \$387,891.49; June, \$527,036.97; July, \$585,644.38; August, \$480,141.49; Total, \$3,755,029.73. The output of the Ontario for the month of August was 72,418.13 fine ounces, and ore sales, \$53,336.02, a total of \$125,754.15. Previous reports from this mine for the year showed an output of \$1,027,839.39; present total, \$1,153,593.54 for the eight months of 1886 that are past. Out of this have been paid eight regular monthly dividends of 50c per share each (\$75,000), \$4.00 per share so far this year, or \$600,000. The August monthly dividend was the 122d of the series, or \$61.00 per share in aggregate. The Daily product for August was 57 bars of bullion, 74,654.36 fine ounces, and \$57,880.06 in ore sales, or \$100,534.42 for the month. For the seven months previous the output of the Daily was \$389,644.78, making the total output of the Daily for eight months \$490,179.20. The receipts of bullion and ore in this city for the week ending September 1st, inclusive, were \$232,873.57, of which the large amount of \$97,702.90 was ore and \$135,170.67 was bullion. The previous week the receipts were \$104,827.81 in bullion and \$66,575.48 in ore, a total of \$171,403.29. Receipts of fine bars for the week were \$32,203.84; of base bullion, \$11,200. The Ontario product for the week was 35 bars of bullion, \$19,144.53; ore sales, lots 160 and 161, \$16,272.55; total, \$35,417.08. The Daily output for the week was 16 bars of fine bullion, \$18,557.18; lots 70 and 71 of ore, \$11,652.35; total, \$30,209.53. The Stormont sent up, on the 26th, \$2995 in silver bars. The Hanauer smelter turned out during the week \$30,860 in bullion; the Germania, 11 cars, \$18,946.80. Ore receipts for the week have been—by Wells, Fargo & Co., \$19,000; McCormick & Co. (including \$13,080 Queen of the Hills and \$2200 King of the Hills, both in Idaho), \$61,910; by T. R. Jones & Co., \$16,792.90.

# PUMPS FOR RECLAMATION, IRRIGATION, AND DREDGING.

WILL BE ON EXHIBITION AT MECHANICS' INSTITUTE FAIR.

This Pump has thrown, on a Test, 234,000 Gallons per hour, On a Lift of 10 feet.

PIT. VERTICAL, BULKHEAD, TURBINE, CENTRIFUGAL AND LOW-LIFT PUMPS.

WE MANUFACTURE ALL KINDS OF

Machine Tools, Including Engine Lathes, Drilling Machines, etc.

Horizontal, Single Acting, Compound Condensing, and Automatic Steam Engines.

Cast Iron Sectional Boilers, Horizontal and Vertical Tubular Boilers, Water Valves, Water and Steam Fittings, Hydraulic Jacks, etc.

Mill Rolls Ground and Corrugated. SEND FOR CIRCULAR.

**SAN FRANCISCO TOOL CO.**

Works, First and Stevenson Sts., San Francisco, Cal.

Sole Licensed Manufacturers of the

**Medart Patent Wrought Rim Pulley**

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington, Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

SEND FOR CIRCULAR AND PRICE LIST.

Nos. 129 & 131 Fremont Street,

San Francisco, Cal.

## THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufactured only by

For Sale by **DUNHAM, CARRIGAN & CO.,** San Francisco, Cal. | **JENKINS BROS.,** 71 John St., New York

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK.  
OR PACIFIC IRON WORKS, SAN FRANCISCO.

## THE SCIENTIFIC PORTABLE FORGE

## AND BLACKSMITH HAND BLOWERS.

GUARANTEED

The Lightest Running! The Strongest Blast! The Most Durable!

ADAPTED TO ALL KINDS OF WORK, AND MADE IN STYLES AND SIZES TO SUIT.

Admission Day.

Thursday marked the thirty-sixth annual mile-stone of the State. The story of the admission of California into the Union constitutes too important a page in our country's history to be neglected. We are glad the Native Sons of the Golden West have taken it into their special keeping.

On the 13th of February, 1850, President Fillmore transmitted to Congress, by message, a copy of the Constitution of California. A motion was made to refer it to a special committee. Many of the Southern Senators were opposed to a consideration of the matter. They said it was contrary to all precedent to allow a people to organize themselves into a government without the previous authority of Congress. On the 17th of April, after a long and stormy debate, the question of admitting California was referred to a select committee of thirteen, Mr. Clay, chairman, and on the 8th of May the committee brought in a series of resolutions, humorously called the "omnibus bill," because it was loaded down with so many different objects. It was the ingenious work of Mr. Clay. It was an effort, amicably, to arrange the great slave controversy. The principal points were: That California should be admitted as a State, without slavery; that appropriate government ought to be established for the territory acquired from Mexico, without the restriction of slavery; that it was inexpedient to abolish slavery in the District of Columbia, and that more effectual provisions ought to be made for the restitution of fugitive slaves. Mr. Clay, although 75 years old, led the debate that followed with all the ardor and fire of his youth. He was anxious to crown the evening of his life with one more brilliant triumph. His speech on this occasion was the last great effort of his eventful life. In the long debate that ensued, continuing till the last of July, the bill was so trimmed and pared down with amendments that the clause providing for "the Territorial Government of Utah" was all that was left. This dismemberment of Mr. Clay's pet scheme was facetiously called "upsetting the omnibus." Subsequently, however, the other portions of the bill were passed in separate bills. The bill to admit California as a State passed the Senate August 13th, 34 to 18; the House on the 17th, 150 to 56. The Fugitive Slave Bill was immediately taken up and passed the Senate August 23d, by a vote of 27 to 12. In the House, the bill passed under the action of the previous question, without debate, 109 to 75. The Fugitive Slave Bill was the price paid by the North for the admission of California. As the witty John P. Hale said, "it was an effort to split the difference between God and the devil," and no good could come of it. By the inerring logic of events the legislation of that Congress led to John Brown and the Border war, the election of Abraham Lincoln, the bombardment of Fort Sumter, the Emancipation Proclamation, the Fifteenth Amendment, and a regenerated Union.

The news that California had been admitted into the sisterhood of States was brought to this city the latter part of October by the steamer *Northerner*, and produced a tremendous excitement. The citizens went to work immediately to celebrate the happy event. As a rule, the remembrance of this day has been left to the Society of California Pioneers, but of late their mantle has fallen on their sons, the Order of the Native Sons of the Golden West. And, as we have already said, we are glad they have taken its commemoration into their special keeping, and this year at San Jose have celebrated this anniversary in a manner worthy of the occasion.

Siphon Pipes.

EDITORS PRESS:—Replying at present only to the jocular part of Mr. Van Loben Sels' late communication on the above subject, I will, in compliance with his request, state that at the town of Alatri, Italy, there are siphon pipes said to have been erected by the Romans 200 years B. C. This was certainly "before the time of iron pipes"—15 centuries at least.

The pipes in Alatri are of earthenware imbedded in hydraulic cement. The old story of the Roman aqueduct being built on viaduct arches, because it was not known that water could be carried in undulating pipes, belongs to Wendell Phillips' category of the "Lost Arts," at least it is not, so far as I know, an engineer's construction of the facts.

If, however, the above does not place the pneumatic siphon far enough beyond iron pipes, I will add that there can be examined in this city drawings of such siphons copied from Egyptian tombs; date 1355 B. C.

Saucello, Sept. 6, 1886. J. RICHARDS.

- 348,368.—INCUBATOR—W. Worswick, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Nothing at all exciting is going on in the share market. On the Comstock matters are quiet. The continued low stage of water in Carson river, causing the Eureka mill also to hang up its stamps, induced the drafting of 60 miners from the Consolidated California and Virginia mine. The repairs to the incline engine at the Crown Point are completed, but it was not deemed advisable to resume ore-extraction work in Crown Point and Belcher, the reduction mills not having the water motive power to run with, thus the 200 miners belonging to these two mines continue to be drafted, as it were, and out of employment. This unusually low stage of water in the river is attributed to the heavy rains of a few weeks ago melting off the great reserves of snow in the mountains; also to the farmers up the valley diverting the water to their lands for irrigation purposes; but the farmers themselves say there is precious little water in the river to divert. The long-continued spell of very warm weather has had considerable to do with decreasing the water resources of the river by drying up the springs in the mountains, and the reported slight increase of water in the river is to be attributed to the cooler weather of the past few days and consequent decrease of evaporation.

Good ore developments are promised in Alta before long by crosscutting on the 700 level, a good little vein being known to exist at that point, which has been held in reserve in order to go ahead with further explorations northward.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Sept. 1, \$23,776; Moulton, 1, \$11,536; Navajo, 4, \$8,437; Moulton, 2, \$14,688; Silver Bow, 1, \$14,920; Lexington, 1, \$22,556; Germania, 1, \$28,000; Hanauer, 1, \$65,700; King of the Hills, 1, \$22,000; Germania, 2, \$33,611; Silver Reef (for August), \$20,120; Hanauer, 3, \$10,665; Stormont, 3, \$30,688; Queen of the Hills, 3, \$13,550; Hanauer, 4, \$36,000. The banks of Salt Lake City report the receipts for the week ending September 1st, inclusive, of \$135,170.67 in bullion, and \$97,702.90 in ore, a total of \$232,873.57.

"The Sinews of Strength."

We would kindly request all subscribers who have not forwarded their subscriptions to this office previous to the receipt of this paper, to remit us as soon as practicable.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

New York Metal Market.

Telegraphic advices dated Sept. 8th give the following New York prices:

BORAX—6 1/4 @ 7 1/4 c.  
BAR SILVER—92 3/4 per oz.  
COPPER-LAKE—\$10.37 1/2 @ 10.50.  
IRON—No. 1, \$17 @ 18.00.  
LEAD—\$4.85 @ 4.95.  
QUICKSILVER—43 @ 43 1/2 c.  
The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Quiet, spot closing 10.15c @ 10.45c.  
Transferable Notices (Lake) issued at 10.30; Transferable Notices (Chili Bars) issued at 1.39 1/2.  
LEAD—Dull at \$4.75 @ 4.95 spot; \$4.80 @ 4.82 1/2 futures. Transferable Notices issued at 4.77 1/2.  
TIN—Fully steady and decidedly brisker at \$21.75 @ 21.90. Transferable Notices issued at \$21.85.  
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$21.90 @ 22.25; Billiton Tin, \$22.00 @ 22.35; Banca Tin, \$21.15 @ 22.50; Baltimore Copper, \$9.25 @ 9.40; Orford Copper, \$9.35 @ 9.65; P. S. C. Copper, \$9.35 @ 9.65; Foreign Lead, \$4.85 @ 4.90; Foreign Spelter, \$4.70 @ 4.75.  
MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge, \$15.00 @ 16.00. Hudson River, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge \$15.00 @ 16.00. Southern, Grade No. 1, \$17.00 @ 18.50; No. 2, \$16.50 @ 17.50; Grey Forge \$15 @ 16.

Our Agents.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

CHILIAN MANGANESE.—The province of Coquimbo, Chili, has become remarkable for the production and exportation of manganese. In 1885, the exportation reached 3753 tons, and during the first half of 1886 it was 38,802 tons. Nearly the whole of this was shipped to England.

AND so they are about to put in new blowers on the Comstock! What, then, let us ask, is the matter with the old blowers who have so long done good service on Pine street and Pauper alley?

The chrome product of the Livermore mines since the 1st of January of this year—about eight months—is rapidly approaching 2000 long tons.

DIVIDEND NOTICE.

OFFICE OF THE  
**Paradise Valley Mining Company**  
San Francisco, California.  
At a meeting of the Board of Directors of the above named Company, held August 24, 1886, Dividend No. 8, of Twenty-five (25) Cents per share, was declared payable on Wednesday, the 25th of August, 1886, at the office of the Company.  
W. LETTS OLIVER, Secretary.  
OFFICE—No. 328 Montgomery St., San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.  
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdies, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump;

## ASSESSMENT NOTICE.

**Truckee Ice Company.**—Location of principal place of business, San Francisco, California. Location of works, Martus Creek, near Truckee, Nevada county, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 1st day of September, 1886, an assessment (No. 1) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 202 Sansome Street, room 4, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 25th day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. W. SCOTT, Secretary.  
Office—No. 202 Sansome St., room 4, San Francisco, California.

## REGISTRATION

—FOR THE—

## General Election.

All electors desiring to vote at the General Election, to be held November 2, 1886, must be registered regardless of any previous registration.

Registration for the General Election to be held November 2, 1886, will commence at the office of the Registrar of Voters, in the basement of New City Hall, on WEDNESDAY, August 4th, and will continue until MONDAY, October 11th, inclusive. Office hours, 9 o'clock A. M. to 5 P. M.

By order of the Board of Election Commissioners.

P. F. WALSH, Registrar.

August 1, 1886.

## ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,  
AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,  
(Signed) N. W. CROCKER, Supt.

Dewey & Co.'s Scientific Press  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

A variety of good Tools, Patterns, etc., with business for sale cheap by a party retiring from business. A splendid opportunity for an enterprising mechanic.

Address A. B. C., care of this paper.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our  
IMPROVED  
HYDRAULIC  
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.  
HOSKIN & CO., Marysville, Cal.

MANUFACTURED BY

**HINCKLEY, SPIERS & HAYES,**

**THE ROLLER ORE FEEDER**

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

## THE ORIGINAL Roller Ore Feeder.

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.**  
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.  
**RANKIN, BRAYTON & CO.,**  
MINING MACHINERY.

San Francisco: Chicago: New York:  
127 First Street. 100 N. Clinton. 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

## BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning  
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-raising, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

T. E. JEWELL, Sole Agent,  
380 Pine St. (Room 4) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

## Stamps and Rollers for Gold Ores.

In the MINING AND SCIENTIFIC PRESS of August 28th was printed an article by Hamilton Smith, Jr., giving the "Costs of Mining and Milling Gold Ores" in California, Dakota and Venezuela. The results, as stated, are those accomplished by crushing ore in stamp mills. According to the statement mentioned, the Sierra Buttes mill of 93 stamps, and the Plumas-Eureka of 61 stamps, crush the ore at the following expense: Sierra Buttes, 56 cents per ton; Plumas-Eureka, 61 cents per ton.

Both these mines are located in California, and the prices for millmen and hands are about the same throughout the State.

In this connection it will be of interest to give the cost per ton of milling ores by one of the new forms of mills, which are claimed to excel the stamp in efficiency and economy.

The Spanish mine, of Nevada county, in this State, has a plant of four of the Huntington centrifugal roller mills. Three of these are five feet in diameter each, and one is four feet. These mills have been in constant use for about 17 months, crushing 120 tons of ore daily.

The report of the superintendent of this mine, for August, 1886, places the cost of milling, including all wear and tear of machinery, at the low figure of 29 cents per ton, or less than one-half the average cost of milling with 154 stamps of the Sierra Buttes and Plumas-Eureka. These mills—the Sierra Buttes and Plumas-Eureka—are known to be the best and most economical running quartz mills to be found anywhere, and they have reduced the cost of crushing ore by stamps to a minimum.

The Huntington centrifugal roller mill has been now in practical use over four years. It has fought and won its way through all the prejudices of millmen who thought there was nothing that could take the place of stamps. But now there are over 100 of these Huntington mills successfully reducing the ores of California, Nevada, Oregon, Idaho, Montana, New Mexico, Arizona, Mexico, Chili and Guatemala.

It is but simple justice to state the facts we have here given. A few years' work is worth volumes of theory. Those who have purchased these mills have ordered others after severe trial; and the users are doubtless the best judges of the efficiency of any machine. Those who have unhesitatingly condemned all roller devices for crushing ores, as opposed to the old stamp, must look at the facts squarely, and at least concede that those who are using rollers, after having used stamps, must know more of the subject than those who are wedded to stamps alone, and will try nothing else.

With such a showing in economy of crushing gold ores, as is made by these figures, it would seem that there is no business (when managed economically and on a proper commercial basis) that will give better results for the time and money invested than the mining and milling of the many gold-bearing veins to be found all over our Golden State of California. Since we have come to a better business basis in our gold mining operations, and are conducting them in a less extravagant way, we have

found that many mines, previously unprofitable, can be made to pay well. And since we have found this out our gold quartz mining industry has become much more prosperous and more important. It is an industry which is on the up-grade. It is increasing in extent as well as in profit. Riper experience and better management, with an elimination of the stock-jobbing feature, have done wonders to advance the industry; and these, added to improved mechanical appliances and more economical business methods, are still further advancing this branch of mining.

## Alaska Gold.

The last steamer from Alaska brought down more gold from Alaska mines than ever came

THE IDE AUTOMATIC CUT-OFF ENGINE.

## The Ide Engine.

The Union Iron Works of this city, sole agents and builders of the Ide Engine on the Pacific Coast, exhibit one of these engines at the Mechanics' Fair. This engine was awarded the first prize by the Franklin Institute, at their Novelties Exposition, Philadelphia, held in the fall of 1885, over all competitors. The advantages of this engine are great economy of fuel, with extreme simplicity of construction, perfect regular speed, and small space required for engines of great power.

All parts are steel, phosphor bronze and charcoal iron, fitted to templates and gauges, and are interchangeable. Every engine is thoroughly tested by running at the works; and valves and governors are adjusted and set

## Coke.

Although a good many thousand tons of coke are used on this coast every year, for smelting and foundry purposes, there is none manufactured here, aside from the small quantities from various local gas works. The coke used is imported from abroad, and arrives in the vessels which come for the wheat crop. Neither California, Oregon, Nevada, Utah, Arizona or Idaho produce any at all. New Mexico, Montana and Washington turn out a small amount, but compared with Eastern States the quantity is insignificant. Mr. Weeks, of the U. S. Geological Survey, who compiled the statistics of last year, gives the following figures of production of coke in the United States in 1885: Alabama, 301,180 short tons; Colorado, 131,960; Georgia, 70,669; Illinois, 10,350; Indian Territory, 3584; Kansas, 8050; Kentucky, 2704; Montana, 175; New Mexico, 17,940; Ohio, 39,416; Pennsylvania, 3,991,805; Tennessee, 218,842; Virginia, 49,139; Washington, 311; West Virginia, 260,571. Total, 5,106,696.

In the rank of coke-producing States, Pennsylvania still stands first, with Alabama second, West Virginia, third, and Tennessee fourth. These four States hold the same rank as in 1884. The largest coke-producing locality in the country is the Connellsville region of Pennsylvania, in which was made 3,096,012 of the 5,106,696 tons, or 60.6 per cent of the coke produced in the United States in 1885. The second largest producing district is what is called the Irwin-Latrobe, which lies along the Pennsylvania railroad, from Larimer to Blairsville, and is, in part, the northerly extension of the Connellsville coking field.

The statistics of coke in this country in 1885 are as follows: Number of establishments, 233; ovens built, 20,116; ovens building 432; coal used, 8,071,126 short tons; coke produced, 5,106,696; total value of coke at ovens, \$7,629,118; value of coke at ovens, \$1.49 per ton; yield of coal in coke, 63 per cent.

The number of establishments has slightly decreased. Part of this decrease is due to the consolidation of establishments, but chiefly to the abandonment of works of but little importance. The number of ovens in 1885 was 20,116, as compared with 19,557 in 1884, an increase of 559, 2.8 per cent. There were, however, only about half the number of ovens building at the close of 1885 that there were at the close of 1884. While the production of 1885 has increased over that of 1884, it is not as great as in 1883, the production in 1885 being 5,106,696 tons as compared with 4,873,805 tons in 1884, and 5,464,721 tons in 1883. There was no increase in the value per ton of this coke in 1885 over 1884, nor has there been for three years. There was, however, an increase in the total value in 1885 over 1884, owing to the larger amount of the coke produced in the former year. The yield of coal in coke has also increased somewhat during the past year, it standing at 63 per cent in 1885 as against 61 per cent in 1884. The yield in 1883, however, was given as 64 per cent, the largest average yield of coal given, the yield for 1880, 1881 and 1882 being but 63 per cent.

before at one shipment. This is an encouraging fact. The great gold mine on Douglas island, where they have a sort of "quarry" to work, is paying the owners handsomely, yielding about \$75,000 a month. Other quartz lodes or deposits, of somewhat similar character, are about to be opened on the mainland, companies having been formed to work them. The Douglas Island mine, however, has certain advantages of power and valuation that enable it to be worked as cheaply as a mine in this State. The country is a hard one to prospect in, there being no roads, and the forests being very dense. Settlements are few and far between, and all transportation must be done by canoe.

There is no definite news from the miners who went after the reported rich placer mines, near the Yukon river. Some miners came from there to Juneau and reoutfitted, buying a ton or two of stores, and then started back to winter; but their movements were made as secretly as possible. They are reported as having had considerable gold dust to pay for provisions and other necessities. No work can be done at the placers in the winter, but the men probably wanted to be on hand as early in the season as possible. From the nature of the climate, the seasons are not very short. We shall not probably hear any definite news as to the extent or richness of these new placers before next summer, unless some of the men not prepared to winter return to Juneau this fall.

by the indicator to operate perfectly under varying loads and any steam pressure.

The Ide is an automatic cut-off engine, made from 25 to 1000-horse power. There are safety bursting caps attached to the cylinder—a guarantee against damage to the engine by water carried over into the cylinder from the boilers.

This engine indicates the power used; and it is guaranteed not to vary one per cent in speed while the engine is running, light or full loaded. The valve, valve-gear and governor are very efficient; bearing and wearing surfaces are large. The fact that Franklin Institute gave the engine the medal is alone sufficient to prove its superiority, for there are none better qualified to judge of the performances of the modern steam engine. In some future number we shall give further details of this engine.

THE assay value of the ore milled from the Con. California and Virginia mine, on the Comstock, according to assays from battery samples, was \$20 for the Eureka mill and \$22.45 for the Morgan mill. Bullion to the value of \$52,971.69 was shipped from the mine during the week.

WASHOE ROCKS.—At the meeting of the California Academy of Sciences, to be held on Monday evening next, Prof. Geo. H. Becker, of the U. S. Geological Survey, will read a paper entitled "Washoe Rocks."

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eps.

## Care of Mine Cables.

EDITORS PRESS:—I was much pleased in reading your article on "Care of Mine Cables" in your issue of September 4th. You are right in saying too much care cannot be used in looking to and treating cables in mines, when life depends on their good and safe condition. I give the following treatment of mine cables—the very best I have ever tried, being a perfect anti-friction and preserving compound.

Tallow softened by heat, seven parts; plumbago, three parts; mix well. Apply thus: Make a long, hollow box or trough; gouge out a 4x6 piece of timber, 18 inches or 2 feet long. Saw down the timber previously, lengthways, and hollow out the trough sufficiently to hold several pounds of the compound, making a hole lengthways of the trough for the cable to run through. Affix to rope and secure by clamps; have the box made stationary while in use, and permit the rope to pass through it while descending or ascending. It will be then thoroughly coated. This done twice a week or oftener will preserve a steel round cable far beyond its usual time of wear. Remove when treated with the compound. I have found and proved this method to be perfect. Raw linseed oil may be used instead of tallow on flat steel cables in much the same proportions, only add a little more plumbago if necessary to get the proper consistency. If tar is used, linseed oil must be added to prevent adhesion. Both ingredients should be mixed warm to prevent the tar from sticking to the fine strands of the cables. Tar of itself wears out and destroys more cables than the casual observer has any idea of, for from its natural sticky properties it displaces the fine strands, wires, etc., by adhesion and violent disruption, while being paid off or unwound from drums—hence the damage. The plumbago and tallow is far ahead of anything known.

Then again, a mixture of common molasses and plumbago applied to the cams of quartz mills is the best anti-friction compound I have ever used, and will use no other. It is made in the following proportions: Molasses, five parts; plumbago, one and one-half parts; mixed as paint would be made so as to be thoroughly incorporated. This will save the cams and tappits from undue wear, and prevent heating. It further obviates the use of any noxious or filthy grease round the mortars, when oils are used. If any of this compound should fall into mortars it will do no harm to amalgamation. I give this from long experience of its use.

Sonora, Cal.

W. F. DRAKE.

## Quartz-grinders Again.

EDITORS PRESS:—Absence in the mountains placed your paper beyond my reach, but as I never fail, sooner or later, to peruse its valuable material, I find, at this late hour, "Censor" says: "'Old Man' has offered no facts in support of his opinion" (as to the superiority of stamps) "except that he knows exactly what he is talking about."

Well, both of these statements I accept. I have purposely avoided giving my reasons, and reassert that I have such dear-bought experience that I do know exactly what I am talking about. Since my reasons are called for, I will give them. Now why, from experience, I eschew all these pulverizing machines, in a few words is, while they are pulverizing the quartz they are pulverizing and abrading the gold also; and the more you pulverize the gold, the more you lose by abrasion and by producing still finer gold, which is so readily carried off by force of the water. The action of stamps is quite different. They reduce by concussion, and by the wash of water and concussion the released gold is carried from the dies into the interstices around them, and every vibration carries the metal to the bottom of mortar and beyond attrition. The "float" gold released, passes off at once, to be taken up by plates or other devices. As to the facilities of other machines for pulverizing quartz, I will make no comments. Still your humble servant will simply say, stamps outlive them all, and why is this? I will leave "Censor" to answer this question. OLD MAN OF THE MOUNTAINS.

French Gulch, Shasta Co., Cal.

POOR CHANCE FOR WORK.—By reason of the suspension of work in outside mining districts through the heavy discount on silver, and the rumor that work is to be resumed in the Occidental and other mines in this vicinity, says the *Virginia Enterprise*, many men are gathering into the city in the hope of employment, and there are more idle men thronging the sidewalks than have been seen for many a day. In addition to the new-comers there are some hundreds of our regular residents also idle, on account of the shutting down of the Crown Point and Belcher mines, the recent draft in the Yellow Jacket, and the chances are that more will have to be laid off through the low stage and continued decrease of water in the Carson river. Things are looking particularly blue, and it is easy to realize that this is a poor place to come to for work.

## Concerning Fools.

It may be a matter of considerable regret that the Fool-killer has ceased to make his periodic pilgrimages through the land. He would have a big job on hand on the basis of Carlyle's estimate, when he speaks of England as an island of "25 millions, mostly fools." Upon the most optimistic view of the case there would be a serious thinning out of the population, when we consider how many, even hard-working people, there are who contrive to fool away their money at "chuckaluck" games and the like. For weeks past in this city, Oakland, and perhaps elsewhere, crowds might be seen every evening at certain street corners "bucking" at the new "tiger" in the shape of the O'Leary belt swindle, when on the face of it the chances of touching the winning card were all against them. And then, what scores of people there are who can never pass one of those itinerant vendors of notions or lotions on the street without stopping to listen to his endless flow of froth-oratory; and to listen is to be convinced, and to be convinced is to buy. The amount of worthless lip-salve, eye-salve, corn-salve, shaving-soap, pens, pinchbeck jewelry and cement they manage to accumulate, the world may never know. No matter how often they have been "taken in," they never learn that street peddlers are licensed liars and swindlers, and the first harlequin who mounts a dry-goods box and shouts, "This way, gentlemen, if you would make your fortunes," will gain their attention and pocket their change. It is clear that if the Fool-killer attended to his duty there would be a lively boom in the undertaker's business.

But, perhaps, the most marvelous exhibition of the fool's mania is the extensive impulse to do something exceptionally dangerous to life and health, such as lifting of enormous weights, diving from high banks or platforms, or trying to swim rapid currents. More than half the charm of the circus or hippodrome is to see the perilous riding, jumping, somersaulting, rope-walking and the various trapeze dexterities. The feeling that enjoys this sort of sport is certainly closely akin to that which drew crowds to the gladiatorial combats or Spanish bullfights. Sometimes there seems to be an epidemic of fools. A few years ago there was such a widespread craze to jump from the top of the Column Vendome, in Paris, that the gates had to be locked to all visitors. There are just now so many cranks willing to risk their lives by jumping from the Brooklyn bridge that there is some talk of inclosing it in a network of wire. The fatal consequences that attended the first plunge from the bridge put a damper on the foolhardy jumpers; but the recent success of a crack-brained bootblack has revived the idiotic ambition. In like manner the fatal result of Captain Webb's effort to swim the whirlpool rapids threw a cold, wet blanket on all candidates to glory by that route; but since Graham went through safely in his barrel there are many men and women who seem anxious to make the voyage.

The English papers satirize what they christen the "Alpine fever," the singular fashion of making arduous and perilous mountain ascents, which no amount of suffering, fatigue or melancholy accidents can cure, or anything short of an involuntary descent of a few thousand feet into the abyss. A kindred mania, quite as acute and hard to cure, is that of Arctic explorations. But there is some semblance of glory in climbing rocky pinnacles, camping on glaciers, sliding on avalanches, or going off and getting oneself lost in the ice and fog and snow of an endless Arctic winter, and having the whole world out searching for you. But of what possible benefit can it be to mankind, or any one, that a man can swim the Dardanelles, fast 40 days or more, jump from the Brooklyn or Covington bridge and live, or go over the Horseshoe falls in a barrel or rubber vest? The *New York Tribune* demands a law "to punish persons who recklessly risk their lives for no useful purpose," but it is hardly necessary to go to that trouble, for, if the Fool-killer neglects his duty, Nature sets traps to catch all such fools and gudgeons that are very effective.

AN IMPORTANT MINING PROJECT.—The *Virginia Chronicle* says a project is now under consideration by the management of the ore-producing mines on the Comstock which, if adopted, will materially reduce the cost of the production of bullion. It is proposed to put up stamp mills in Sutro tunnel to be operated by water power. The ore pulp resulting from crushing will be flumed to concentrators, set up on the outside of the tunnel. In many of the shafts there is plenty of water flowing from the upper levels to drive a turbine wheel with the tremendous pressure of more than 1000 feet perpendicular fall. The ore extracted from the upper levels will be run out through the connecting drifts and dumped into the battery self-feeders, located in the tunnel. This will save the cost of hoisting ore to the surface by expensive machinery, of fuel for generating steam and the expense of transportation and handling the ore over several times, as is the case at present. It is estimated that by adopting this method Comstock ore can be extracted and be converted into bullion at a cost of less than \$5 per ton.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT AND FLOWER PICKER AND HOLDER.—T. C. Stark, Vallejo, assignor of one-half to Wm. A. Bruce. No. 348,357. Dated Aug. 31, 1886. The invention relates to a device for gathering fruit, flowers or other things having stems to be cut, which it is desirable to hold after being severed from the branch without handling the article itself. The bloom is not brushed off, and the grapes or other fruit are not injured by handling.

EXCAVATING MACHINE.—Albert Boschke, S. F. No. 348,376. Dated Aug. 31, 1886. This excavating or dredging apparatus is an improved form of the one patented by the same inventor, July 7, 1885. It consists of a wheel rotating in a vertical plane, having buckets or scoops, and radial continuations or passages extending from these buckets toward the center of the wheel. In combination with this are the discharge chutes or openings upon the sides of these passages. The wheel is arranged to be raised or depressed about the journals of the supporting arms.

GAS REGULATOR.—Archibald Ford, S. F. No. 348,389. Dated Aug. 31, 1886. This consists of an independent annular chamber containing a liquid to receive the edges of the bell-shaped float attached to the valve-stem, this annular chamber having a flange or means by which it may be fitted to any sectional gas regulator-chamber and take the place of a diaphragm. The invention also consists of certain details of construction and a means for discharging the condensed water to prevent its coming in contact, or interfering, with the valve.

INCUBATOR.—Wm. H. Worswick, S. F. No. 348,368. Dated Aug. 31, 1886. This incubator consists of an outer shell or casing having mounted within it an inclined floor with a raised screen-surface, an inclined water-tank above the floor, and a brooding chamber at the end of the main chamber, having an underlying water-tank; suitable water-service circulating pipes connected with the tanks and boiler of the heating apparatus; and independent egg-carriers resting upon and adapted to be moved over the screen-surface of the inclined floor. This incubator is a continuous one, and the eggs are automatically turned as the trays move down the inclined screen-plane. It is best adapted for raising chickens on a commercial scale on large ranches.

AUTOMATIC FILLING FAUCET.—Ulrich Bachman, St. Helena. No. 348,372. Dated Aug. 31, 1886. This is one of that class of apparatus used in transmitting a liquid from one receptacle to another, and which may be termed "filling-faucets." The object is to automatically shut off the flow of liquid when the receptacle into which it is being transmitted is full, thus avoiding waste. The particular use of the faucet is in transferring wine and other liquors from one cask to another. This is usually done by an ordinary siphon; but when the receiving-cask becomes full, it suddenly runs over before the siphon can be removed. The invention consists in an elbow-pipe, one arm of which is inserted in the bung hole of the receiving-cask, and the other has coupled to it the pipe or tube from the other cask. Within the elbow-pipe is a valve for opening and closing it. The valve is influenced by springs, and is drawn back from without, being held by a pawl, said pawl being tripped by the action of a float or trigger within the receiving-cask, when said cask is full, whereby the faucet is closed.

GAGE FOR PLANER-KNIVES.—Addison Potter, Portland, Ogn., assignee of one-half to N. W. Spaulding, S. F. No. 348,341. Dated Aug. 31, 1886. This invention relates to a device for rapidly and accurately setting the knives or cutters upon planer-heads, so as to insure both ends being at the same distance from the head and all the cutters being equally set. It consists of a bar, one edge of which serves as a guide against which the edge of the planer-knife may be set, and arms extending backward from this bar, and adjustable by screws or otherwise, from the rear of the planer-head. In the ordinary construction of planers, a head is journaled so as to be rotated rapidly by proper pulleys and belt connections. Upon opposite sides of this head are fixed cutters or knives, the edges of which project from the angles of the planer-head as much as may be desired for the purpose of planing. The rear portions of these knives are slotted and held in place by bolts passing through these slots with nuts upon their outer ends, the adjustments being made by loosening the nuts and moving the knives in or out. This adjustment has usually been regulated by means of a rule applied to the front side of the planer-head, just below the edge of the knife; and, the nuts being loosened, the knife is moved backward or forward, setting first one and then another until it is satisfactorily arranged. Mr. Potter's invention much simplifies the old plan and insures more accuracy.

PAPER WALLS FOR WAR SHIPS.—The walls of several of the British war ships are said to be constructed of paper.

## The Wire Age.

We have had the stone age, the bronze age, the iron age, and it is likely the future annalist will describe this period of American history as the wire age. In no part of the economy of daily life are we separated from wire. Sleeping, we repose on wire mattresses. Eating, we see foods that have passed through sieves, and which are sheltered from the flies by wire covers. Calling, we pull wires to ring curled-wire gongs. Traveling, we are conveyed by cable or electric railways, hoisted by elevators hung on wires and hurried over wire bridges. We announce our coming by telegraph or telephone wires, and we thrud our way by night through streets lighted by means of electric wires. Across the prairies of the West are stretched thousands of miles of barbed-wire fences, against which dumb brutes protest, cowboys swear and draw the knife, and lawyers, juries, judges and reporters whet their intellectual blades. Our clocks are set by wires, our watches run by wires, our books are stitched with wires, our pictures hung on wires, and our politics managed by wire-pullers.

## Comstock Pay-rolls.

Following are the amounts disbursed to employes for the month of August by the various mining companies, mills, etc., connected with the Comstock:

Con. California and Virginia.....	\$80,301 00
Gould and Curry.....	4,080 00
Hale and Norcross and Savage.....	10,221 00
Mexican.....	7,114 00
Ophir.....	4,768 00
Union Consolidated.....	1,551 00
Utah Shaft.....	455 00
Union Shaft.....	315 00
Sierra Nevada.....	3,501 00
Chollar and Combination shaft.....	20,000 00
Overman.....	1,500 00
Alta.....	1,500 00
Justice.....	300 00
Kentuck.....	9,000 00
Six-mile Canyon pay-rolls.....	4,500 00
Osbiston shaft.....	10,404 00
Yellow Jacket.....	11,685 00
Carson river mills.....	45,000 00
Best and Belcher.....	1,341 00
Total.....	\$167,980 00

MINING LOCATIONS.—The *Placer Republican* calls attention to the ambiguous manner in which many notices of mining locations read. There are so many uses of the expressions "more or less" and "thereabouts," that it is often impossible for a practical hand to go on the ground with a copy of the notice and determine its boundaries. Then again, the most usual land-mark adopted is "a pine tree," and as there is an infinite number of pine trees all nearly alike, the difficulty of searching out the lines is increased accordingly. The *Republican's* informant has seen notices intended for the Michigan Bluff district which would fit a claim at Iowa Hill equally as well as the one it was intended to describe.

ACROSS THE INYOS.—Times are said to be depressingly dull over in Fish Lake valley since the closing down of Candelaria. The farmers are busy with big crops, but the surrounding miners are not making fortunes. Nothing of consequence is being done at Lida or Gold Mountain, though in the latter a small, new mill is about ready to start, but water is scarce. Some 10 or 12 men are putting things in order at Palmetto. But as an offset, Silver Peak is said to be booming.—*Inyo Register*.

GOOD REPORTS FROM AN OLD DISTRICT.—The Silver City *Avalanche* hears the most favorable reports from Flint district. As work progresses the mines are showing up splendidly, and the expectations of the owners will be more than realized. Years ago considerable work was carried on in the mines of Flint district and a large mill was built there, but the ores were so refractory that they could not be worked profitably by the processes then in use.

COAL MINES CLOSED DOWN.—The mines of the Northern Pacific Coal Company at Timberline, M. T., have been closed, owing to the continued trouble between the owners and their men. This action is regarded as a victory for the men, as it is practically an admission on the part of the coal company that they cannot secure men enough to carry on the work. There is great rejoicing among the locked-out men and the people generally who sympathize with the miners.

APPRECIATION.—An old subscriber to the PRESS writes: "I herewith send amount for renewal of my subscription to the MINING AND SCIENTIFIC PRESS. I prize your paper very highly: so much and such a variety of interesting matter, well selected. Please continue sending it to same address."

THE new well for supplying Chico with pure water is now about 30 feet deep, and it has been discovered that there is gold in the gravel now being thrown out. County Surveyor McGann talks of filing on the property as mineral land.

A METAL that expands in cooling is made of lead nine parts, antimony two parts, bismuth one part. This alloy can be advantageously used to fill small holes and defect in iron castings.

### German Commercial and Industrial Progress.

The Germans are making rapid strides in commercial and industrial progress, but at a fearful cost, as will be seen in the sequel. They are to-day, by far, the most energetic and progressive people on the European continent. They have a most magnificent merchant marine, to which they are constantly adding. They are replacing their sailing ships with steamers, and as speed is now one of the chief factors of success, the old slow-going steamers are fast giving place to those of greater speed. They have already a fair share of the passenger traffic between Europe and this country, and report says they are about to make an effort to break the virtual monopoly which the French and English have long held in the East. Five powerful steamers are to work the East Asiatic line from Bremerhaven to Shanghai, and there is another line to Australia and the Samoan islands overland via this port. Passengers and letters are taken by this line from London and Paris to Shanghai and Hong Kong in four days less time than occupied by the Peninsular & Oriental Company's steamers, and plans are now maturing to still further increase the speed on this line.

#### German Competition in Tools, Etc.

The Germans have also initiated a strong competition with the English iron-workers in the manufacture of rails, tools, cutlery, and some other articles of hardware. Sheffield appears to be especially excited under the influence of some spicy correspondence which has grown out of this competition, in which much crimination and recrimination is involved in regard to ill-advised action on the part of the manufacturers by which it has become possible for the introduction of German tools not only into foreign but into the home market as well. The *Ironmonger* becomes quite excited and says: "If the Germans, or any other people, are able to supply our requirements better than we can do so ourselves, then we ought to retire as gracefully as possible under the circumstances, and acknowledge that we are invertebrate, non-inventive, non-progressive and beaten." "Genuine German knives" are advertised in London newspapers, which praise their excellent qualities. Only a few years ago nobody in Germany would have bought a knife which did not bear the stamp "Sheffield." An English journal says: "German nails and small tools lead the market."

#### In Regard to Rails,

The gravity of the situation is also decidedly marked. A recent correspondent of the *London Engineer*, in referring to the causes for this invasion of English industries, says: "But, may I venture to observe that if even the English workmen became ever so frugal and thrifty, and accepted comparatively low wages, it could not in the case before us, and probably in others, too, square the account with the foreigner."

"We are handicapped by three factors," he continues. "For instance, in this country, where protection is the rule, the price is sufficient to leave a tolerable margin, and £6 and above was the accepted price of a tender for rails for the Berg Markisch railway last week, while the market quotations are still higher. Such a price is not possible in England with free trade; but just this extra price obtained here enables the foreigner to hold out and compete with us outside his own country, and this without loss to himself." The other two factors with which the English rail-maker is handicapped in the race with his Teuton competitor are set down by the correspondent as the low railway freights and the easy royalties existing there. The success and

#### Persistency of German Competition

Is further alluded to by the *Ironmonger* as follows: "The energy and ingenuity of our German competitors seem to be almost inexhaustible, and it begins to be pretty plain that they have entered the lists with the firm resolve to wrest away from us as much foreign trade as possible. Having had overgrown manufacturing industries fostered by their own tariff, they find themselves burdened by an excess of production which they are compelled to dispose of abroad or find themselves surrounded by very serious difficulties. In order to evade, or at all events to postpone, this issue, they are pushing their export trade in a most determined manner, and are doing so with all the advice and assistance their Government is able to give them. In order to meet the competition of British coal in their own ports, German railway rates from Westphalia to Hamburg and Bremen have been considerably reduced, and every effort will be made to augment the consumption of German coal," etc.

#### A German Method of Obtaining Designs.

A few days ago a German was observed busy sketching various objects of china and glass displayed in a well-known London shop window. An assistant rushed out and dragged him into the shop. His book, which was taken from him, was found to contain many carefully-executed drawings of various expensive goods. He was allowed to depart, but without his book. Such a procedure on the part of a shop-keeper appears singular to an American. Here, the only recourse would have been to remove the goods from observation, and not the man;

while taking the book from him would have to be condoned by a not very brief residence in some penal institution.

#### Wage-workers in Germany.

The facts referred to above present the most effective commentary on the natural working of free trade which could well be made. The effect would be even more decided here than in England. German manufacturers secure their advantage in the markets of the world at the expense of the wage-workers. U. S. Consul Warner, at Cologne, in a recent communication to the State Department on the condition of the laboring classes of Germany, writes as follows: "The wages of a laborer, whether he works in iron or steel manufactories, coal mines, stone quarries, on buildings or railways, ranged from forty-seven to seventy cents per day, and if he is a skilled laborer, from 80 to 92 cents per day. Female labor is only allowed in a limited degree, and is only paid from 24 to 30 cents per day. Working hours are from six to six in summer and from seven

supremacy in the markets of the world, that, with the single exception of cotton manufactures, they are placing their goods at prices which are ruinous to the proprietors as well as to the workers. Statistics are given in a German journal of 30 leading companies in the iron interests, representing a stock capital of about \$51,000,000. More than one-half of the companies paid no dividend at all during the last year, while the average dividend for the whole business was only 1.5 per cent. This necessarily means low wages and hard times for the laborers, and lack of income and consequent deprivation for the small stockholders in that trouble. If the vessel goes slower than four knots an hour, the drag does not do as well, as it is apt to rise to the surface, where it is not so efficient. The gear used on the *City of Brooklyn* did not cost over \$100. The size of the drag should be in proportion to the vessel, but it should present a flat surface, as shown, and the bridle must be made as shown, to be effective. A large ocean steamer could have this gear ready at hand for use in case of acci-

twigs and the under side of the leaves, with a fine brownish down or pubescence. Upon the leaf there are 10 or 12 pairs of strong ribs or veins on each side of the central midrib. The flowers are small and appear in clusters of 10 or 12, proceeding from the axils of the leaves. There is one common stalk or peduncle and a more delicate pedicel for each flower. The blossoms are of a greenish hue, with five acute sepals and as many smaller, hooded petals divided at the point. They also have each four or five stamens, and a short style, three to four cleft. The flowers are followed by small black berries, as big as a pea, which consist of three bony seeds or nutlets, with a thin, pulpy covering. (At the lower left-hand corner of the cut are shown a flower, enlarged, and a cross-section of the fruit.)

The bark possesses active cathartic properties, and has been lately introduced into medical practice, large quantities for the drug trade being annually gathered in Oregon. The bark of *Rhamnus catharticus*, of Europe, has been thus employed since long ago, and these purgative qualities are probably common to many species. There is in this State a species called *Rhamnus Californicus*, whose bony seeds have been used now and then as a substitute for coffee; but they contain no caffeine, the peculiar principle of the true coffee.

#### Reduction Works at Reno.

The *Reno Gazette* says: The Reno Smelting, Mill and Reduction Works Company have organized with the following named trustees: H. H. Beck, A. H. Manning, Archie Farrington, John Howell and M. Carey, who have elected as president and managing director, John Howell; secretary, William Thompson; treasurer, the First National Bank, and superintendent, M. Carey. The company have purchased 10 acres of land, with a right of way to the river for ditch, flumes and dam of Messrs. Bailey and McKissick, and have commenced work on the ditch and dam. They have contracted for lumber, brick, machinery and other material, much of which will soon be on the ground, and will commence the construction of their works within ten days. It is their intention, as soon as the material and machinery arrive, to put on a force of 20 or 30 men, and push the completion as fast as possible. The building to be first erected will be the main building, which will be used for ore receiving and sampling-rooms. As soon as it is completed the company will commence sampling and purchasing ore.

They will purchase gold, silver, lead, copper and antimonial smelting ores; also gold, silver, lead and copper concentrates, slag, matte and other secondary products; also all free and base milling ores. It will be their purpose to pay such prices that the miner will be able to realize on ores which were heretofore valueless to him, or, in other words, with the facilities the company will have for working cheaply, they will be able to handle a class of ores with a profit to the miner, upon which it has been impossible for him to realize anything. Reno has, for years, been recognized as the most available point on the coast for general reduction works. Howell and Carey, both practical metallurgists, with 24 years' experience in this State and California, after very extended observations, have selected this place as the one of all others. It has been rumored that they are in the interest of the Selby Works. This the *Gazette* is authorized to most emphatically deny. The company represents no other capital or interest than that of the individual stockholders. Besides being practical workers of ores, Howell and Carey are largely interested in mines, the products of which, as well as those of the mines in which Archie Farrington, of the well-known firm of Farrington Bros., who, as a trustee, is so largely interested, will be worked here. The other stockholders and members of the Board of Trustees are gentlemen who are well known here and throughout the State. They are men of means and business experience and have taken hold of this much-needed enterprise with the purpose of making a success of it, and supplying a long-felt need. The capacity of the works will be increased like those of Salt Lake, Denver, Leadville and elsewhere, as the demands may require. These works will be the beginning of a new epoch in the mining history of this State. They will not only attract the attention of the prospector, but will be the means of drawing capital hither. Old abandoned mines will be reopened. New camps will spring up here and there. The lethargy that has existed for years will be thrown off. Agriculture, grazing and commerce will keep pace with mining. The tide of adversity will be turned to that of prosperity. The State will commence to grow in wealth and population.

GRANITE DISTRICT.—Word comes to us from this district, which is about 18 miles south of Cherry creek in the Egan range, of a most flattering nature. The mineral is gold and the mine we refer to is the property of Fred. Gotchet, and is now leased by ex-Senator Doolin, of Eureka, and Thomas Kenny, of White Pine. From eight tons of ore, crushed at the four-stamp mill in Telegraph canyon, they realized \$4900—no discount. They have out considerable more rock, which is said to be "lousy" with gold, but their water supply is too limited to crush it just now. Granite district will be more extensively heard from some of these days.—*White Pine News*.

CASCARA SAGRADA—*Rhamnus Purshianus*.

to seven in winter. One hour is given for dinner, a half hour for breakfast, and a half hour for coffee in the afternoon. The Government has no power to regulate or interfere with working hours, but it takes care that certain restrictions with regard to the employment of women and children are observed. Rent is \$2.85 per month on the average, or one full week's wages. Meals cost 24 cents per day and consist principally of potatoes. They have also peas, beans, vegetables, common pork and black bread. Occasionally they have dried fish and beef, but more often horse flesh. The laboring classes are poorly clothed, as a rule. Notwithstanding the depressed state of wages, as above described, it is well known that there are many German emigrants in this country from the very district about which our consul writes, who "kick like steers" because they can't get over \$2 a day in this country and obtain their beer and pretzels free. Most of these, however, are Socialists. What ungrateful wretches!

#### Manufacturers' Profits.

Notwithstanding the ruinously low rate of wages, so fierce is the spirit of competition, and so determined are the Germans to secure

dent to the rudder. It is the simplest device of a practical nature which has come to our notice.

#### Cascara Sagrada.

The last report of the Commissioner of Agriculture has an interesting article on "Native Medicinal Plants," by Dr. Geo. Vasey, botanist of the Department. In this we find an account of the Cascara Sagrada (*Rhamnus Purshianus*), pictured upon this page. This plant grows on the Pacific slope from Northern California to Oregon and Washington Territory, and also occurs sparingly in Idaho and Montana. It varies much in size according to location, being found in some places only as a shrub 10 or 12 feet high, in others becoming a tree 20 to 40 feet in height, with a trunk a foot or more in diameter.

The leaves are elliptical in form, undivided, from two to six inches in length and from one to three in width, with very fine teeth on the margin, which indeed is sometimes almost entire. The petiole or stem of the leaf is half an inch to an inch long, and covered, as are also the young

## TABLE OF CONTENTS.

**EDITORIALS.**—Stamps and Rollers for Gold Ores; Alaska Gold; The Ide Engine; Coke, 181. Passing Events; The Hydrogen-Amalgam Process; Buried Booty; Electricity for Power; Minerals Found in the United States, 184. Mining Directors and Superintendents; At the Mechanics' Fair; Developing Mines; A Cheap Truck for Mining Purposes, 185.

**ILLUSTRATIONS.**—The Ide Automatic Cut-off Engine, 181. Casaca Sagrada (Rhemus Parashianus), 183. The "Montana" Mining Truck, 185.

**CORRESPONDENCE.**—Care of Mine Cables; Quartz Grinders Again, 182.

**SCIENTIFIC PROGRESS.**—Positive and Negative Electricity; Electric Motors in Mines; The Size of a Spider's Thread; Utilizing the Heat of the Sun; A Layer of Coal; Earth Temperatures; Ballistic Photography; Women in Science; How to Measure a Candle-power; Fluted Carbons; How to Separate the Layers of Insects' Wings; Height of Twilight, 186.

**MECHANICAL PROGRESS.**—Modern Progress; African Blacksmiths; Simplification of Machinery; Is Iron to be Superseded; Gas Cheating—An Invention Greatly Needed; Large Planing Machine; A New Telegraph Wire, 186.

**ENGINEERING NOTES.**—A New Boat-propelling Device; New Canals in Russia; The Hennepin Canal Scheme; High-speed Ship, 187.

**USEFUL INFORMATION.**—A Lubricant for Brass Work; Imitation Vermilion; The Adhesiveness of Iron Oxide Cement; How to Grass a Bank; Bay Window Cars; Green Varnish for Metals; Stretching Emery Cloth; How to Tin Cloth; To Construct a Rain Gauge; Lustrous Polish for Cabinet Work; Fitting Keys; A New Patent Dodge, 187.

**GOOD HEALTH.**—One Secret of Right Living; A Blast Against Beer; Diseased Eggs; Wonders of Diet; Salt and Water for the Feet; Turpentine as a Remedy for Lock-Jaw; Ventilating a Room, 187.

**MISCELLANEOUS.**—Concerning Fools; Notices of Recent Patents; The Wire Age; Comstock Pay Rolls, 182. German Commercial and Industrial Progress; Casaca Sagrada; Reduction Works at Reno, 183.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 188-89.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 192.

## Passing Events.

Within the past week we have seen quite an encouraging advance in the price of silver, which will bring rejoicing to the hearts of the many silver miners on the coast. It is on the upward grade now and is apt to go up faster than it came down.

There is very little of an important nature to speak of in the present mining situation. Work is going on steadily in all the districts. In this State the gold quartz industry continues to improve, as it has been doing for some time past.

The Mechanics' Institute Fair in this city and the State Fair at Sacramento are in full progress, and each attracts large numbers of visitors.

The resurvey of San Pablo and Suisun bays, which form the upper portion of San Francisco bay, has been commenced this week by the officers of the U. S. Coast Survey. The results of their work will not be made public for many months, probably, but will be of interest to our mining community, as they have a bearing on the hydraulic mining question.

DEPOSITS of gold-bearing gravel are reported as being discovered and worked in a ravine north of the Harrison mine, on the west side of the Mount Davidson range, and extending down to the lower Washoe lake.

## The Hydrogen-Amalgam Process.

Paragraphs are beginning to go the rounds of the press in this country referring to the success achieved in working gold ores by the hydrogen-amalgam process in England, where it originated. So far we have seen no description of the process which is satisfactory. It is stated in the English papers that the essence of the process is "that the mercury used in this process never 'sickens,' but remains absolutely quick in the presence of the most refractory ores, such as those containing sulphur, antimony, arsenic, etc., and that each particle of the ore is separately rolled in the 'quick' mercury for from 15 to 30 seconds or more. No two particles of the ore can cling together, and during the transit of the ore through the amalgamator each particle is submerged beneath the surface of the quick mercury. Everything that leaves the stamps must thus pass through the mercury under the above conditions before it can escape into the slime pits. Whether the ore be pulped to an impalpable powder or only crushed to the fineness of a 30 sieve, the action is the same. Any loss from float gold, or from suspended particles of ore carrying gold, is rendered impossible. In this direction alone the amalgamator should prove of great value. The absolute contact, continued as it is for a considerable time, renders the extraction much more efficacious than is found to be the case in any of the ordinary systems of amalgamation now in use."

All this is very unsatisfactory and confusing, and still more so in the statement that "the electro-chemical reactions which take place set free a quantity of hydrogen gas, which has a reducing action upon the ore, and further facilitates the extraction of gold."

This idea of passing the pulp through a mass of mercury is by no means new; on the contrary, there are over, perhaps, a hundred different patented appliances for accomplishing it. Notwithstanding this, none of them are at work. Theoretically, the plan of passing all the pulp through a body of mercury is all very well; practically, it does not accomplish what is expected of it. If the ore could be put into the mass in minute forms it would be all right, perhaps; but, whether forced in from below, blown in by steam or air, or carried down by screw or propeller, the pulp goes into it in small masses, from the size of a pinhead up to that of a bean. And when once in the mercury it remains in that shape, and will not fall apart. Therefore, only the outside comes in contact with the mercury, and particles of free gold inside the little pellets of pulp will pass through three feet of mercury unamalgamated. It is the same when molten lead is used instead of mercury; neither plan has been successful. We should want to see the new process accomplish this part of its work before believing it could be satisfactorily done.

The "electro-chemical" feature, and the "reducing action of hydrogen gas on ore" do not sound encouraging without detailed scientific explanations. These terms are used so frequently when they mean nothing that people are shy of processes which seem to require them. The new process was invented by an English M. P.—Mr. Bernard Molloy—and a company has been formed which is said to have treated ores for Australia, India, America, Mexico and Africa. It is adapted for gold ores, so that no doubt we shall soon hear of its introduction in California. When trials are made here on a practical scale we shall be better able to judge of the merits of the process. But we have seen in San Francisco gold ores worked with "hydrogen gas," by electro-chemical action, by molten lead, and by quicksilver bath, and after a flourish of trumpets and an exhibition, and then a final practical trial, these processes were abandoned, and we kept to the "good old fashion" to make money.

**THE V-FLUME CASE.**—The appeal bond on a writ of error to the United States Supreme Court, in the case of James W. Haynes against Edward McLaughlin and others, has been filed in the United States Circuit Court for \$3000. This is the well-known suit for infringement of patent in what is known as the V flume, and decided recently by a jury in favor of the defendants.

A KENDALL ore-stamp mill has been put up on the Ridgeway mine, New River district, Trinity county.

## Buried Booty.

So these many years has the tale of money hidden by Captain Kidd on the banks of the Hudson been extant, so little has ever occurred, however, to verify the truth of such legend, that there is need now for the promulgation of something new in this department of fiction. Timely, therefore, is the story lately told by a San Jose paper about valuables secreted by Joaquin Murietta somewhere in the hills of Santa Barbara county.

Briefly recounted, this story runs as follows: Some two years ago Abelardo Mendoza, a Mexican, charged with the improbable crime of horse-stealing, was shot and mortally wounded in Kern county by an officer who was seeking to arrest him. Before dying, Mendoza confessed to having once belonged to Joaquin's band of marauders, stating that this noted bandit had during his lifetime buried much valuable plunder in Santa Barbara county. The wounded malefactor, already in *articulo mortis*, proceeded to join his chief on the other side before he could definitely describe the locality of the plant.

This untimely taking-off of Mendoza was to the *quid nuncs* and seekers after hidden treasures a sore disappointment. To think that the man should have been so snatched away when just another moment—a few more gasps of breath—would have enabled him to make such coveted revelation, was indeed trying to the patience of this class of expectants. But they were not discouraged; they bided their time, well knowing that some other of the fraternity would, when in limbo or in mortal extremity, supplement this statement of the defunct Mendoza with more full and accurate information as to the locality of the robber's loot—so full and accurate, perhaps, that they could straightway go and capture it.

And so, indeed, it has happened. Sheriff Branham, while escorting, not long since, another Mexican to San Quentin, condemned to there do the State some service, was informed by the culprit that it had been his good fortune to be acquainted with Abelardo Mendoza while the latter was here tarrying in the flesh; that he was in the habit of running with him, and many a deep potato had they taken together. On these occasions, when far gone in his cups, Mendoza had time and again assured him that he knew where Joaquin had concealed a great deal of money and other valuables. For a time at first he refused to reveal to his *compadre* the exact site of the cache, fearing the ghost of Joaquin would do him a harm if he disclosed the secret.

At length, however, his scruples were so far overcome that he not only told his friend where the plunder was deposited, but actually went with him to the spot, where three oak trees were found standing in a line, and everything else as had been represented. Digging under one of these trees, a box was unearthed about three feet beneath the surface, containing a large number of knives, pistols, spurs, etc. Under another tree a second box was dug up, filled with jewelry, gold nuggets and coin, the whole worth a great many thousand dollars. The twain having helped themselves to \$1000, committed the box again to the earth, intending to return at some future time and secure its entire contents. While a bad turn in the luck of Mendoza defeated this purpose on his part, his companion, now an occupant of San Quentin, went back, as he says, during the past spring and helped himself to \$1500 more of the dead bandit's hoard, leaving, as he thinks, at least \$15,000 in gold still in the box.

Such is the story told by this convict to the good Sheriff Branham. That it is veracious throughout, no one acquainted with the character and methods of these Mexican outlaws can for a moment doubt. We all know that Joaquin and his followers were noted alike for their truthfulness and frugality. Thrifty fellows were they all, addicted to getting and saving, especially the former. Accumulation was with them a ruling passion. As a fitting sequel to this pleasant story, let now the sheriff of Santa Barbara county go out into the hills described, find this buried swag, dig it up and advertise for the owners. This done, the honest miner shall come forward, claim the loot, distribute it among the crowd, and all hands take a drink!

MOUNTAIN FIRES are prevailing in a number of localities in Southern California.

## Electricity for Power.

The telegraph informs us of the successful trip of an electric steam launch across the English channel and back, taking three hours and 51 minutes to cross and four hours and 15 minutes to return, on a calm day. The accumulators were charged once in the 50-mile trip. Small launches, propelled by "stored electricity," have been known a few years, and have been tried on European rivers, but this is the first "outside trip" of which we have read. The time is not very fast—about six miles per hour—though the yacht may have been a small one.

On this coast we have thus far had no electric boats, though it would be a good place for them if storage reservoirs are to be used, since there is in summer a strong and constant wind, which could be utilized for generating purposes. The only attempt made here thus far for using electricity for power, aside from small or experimental work, is that now being carried out at Los Angeles on a street railroad, the cars on which will be propelled by electricity. Mr. Keith had one of his dynamos at the Mechanics' Fair last year, harnessed to a pump, and it seemed to work well; but there is an apparent willingness on the part of the public to let some one else make the first experiments of a practical nature with electricity for power.

The result of the Los Angeles street railroad experiment is looked forward to with interest, for these roads have not been so successful elsewhere as was hoped. Moreover, the electric road there will have to compete with the cable roads, and there will be an excellent chance for comparison. Of course, steam is the original source of power for each, and it will be interesting to know whether the engine applied direct to the rope which draws the car can do the work cheaper than the engine which revolves the dynamo which furnishes the electric current for the other road. We confess that it looks as if the cable was the surest and cheapest method.

## Minerals Found in the United States.

J. C. Foye, Professor of Chemistry and Physics, Lawrence University, Appleton, Wisconsin, has written a little hand-book of mineralogy containing the determination, description and classification of minerals found in the United States. It is published in Van Nostrand's Science Series, and has just come to hand. It is a revision of a previous work published under the title of "Mineral Tables," but the present form is much more convenient. It is evidently the intention of the author to furnish a work by the aid of which minerals found in this country may easily be determined, to give concisely their prominent and distinguishing characteristics, and to present the classification commonly used in assaying cabinets.

There is a slight modification of the original form of the tables. The description of the species is given in short paragraphs instead of being presented in tabular form, as it allows a greater latitude in making descriptions, and gives an opportunity to compare closely allied species. The subjects in this part of the work are arranged in alphabetical order. The new system of nomenclature is mainly used. Each species in the chapter on "description of species" is numbered in a parenthesis to correspond to the numbering in the chapters on classification. The classification by basic elements and ores is specially convenient. In the introductory chapter are descriptions of apparatus and reagents, blowpipe reactions, scales of hardness and fusibility, etc. The index is quite complete, and the little work is a very handy one to any one interested in ores and minerals.

IN THE matter of the alleged contempt of the Omega Gold Mining and Ditch Company, one of the defendants in the noted North Bloomfield debris case, Master in Chancery S. C. Houghton has submitted his report to Circuit Judge Sawyer, in which he finds the defendant guilty of contempt of court. The contempt was committed by reason of violating the decretal injunction of the court, enjoining the defendant from carrying on hydraulic mining in Nevada county.

THE San Francisco Mint is the largest in the world, having a coinage capacity twice that of Philadelphia and thrice that of the English Mint.

## Mining Directors and Superintendents.

When people employ mining engineers to carry on their work for them they should first look out to get a good one, and then not try to tell him how to do what he is employed to do. If he is inefficient, let him go and get another. But it is unjust for people in the city to criticize harshly all that is done at the mine, with the idea that they know better than the engineer who is on the ground. It is a common fault with directors of companies to think, because they are directors (by virtue of owning a certain amount of stock), that they know more about the details of the mine and mill than the superintendent himself. Many a promising mining venture has been wrecked by too much "bossing" from the city office. It is especially the case where mines are at a distance from business centers, where conditions are essentially different, that the superintendent knows better what to do than the directors.

Oftentimes, if the superintendent reports everything just as the directors want, he is all right, but should he happen to differ, and offer any advice, he is "hailed over the coals" and often abused unjustly. The *London Mining Journal* has a sensible paragraph on this subject, as follows:

Directors of mines who have no experience of the working and management should not ignore the opinions and judgment of experienced men whose business it is to give honest advice or opinions, even if they are at times unpalatable. Mining management is no plaything for amateurs to try their pretence hands at other people's expense. Our best mining engineers have gained their experience and practical knowledge by hard work themselves and at their own cost, which is a very different thing from theorizing at other people's. Directors of mining companies who are intrusted with the expenditure of shareholders' capital have no right to ignore the opinion of experienced engineers as to management of mines, but are in duty bound to give heed to honest advice, whether palatable or not. Most of the failures of gold-mining companies in England have been traceable to the fact that the directors had no knowledge of the work to be done, or how to do it, and preferred the appointment of inexperienced friends as officers or those who would promise big results; and also from the overweening vanity of men who puffed themselves into great importance through being dressed with a little brief authority. The most important appointment that a board of directors can make is that of their consulting engineer, by whose opinions, if he is a competent man, they should be guided. What is the use of half a dozen inexperienced directors attempting to override the opinions of their engineer, as is so often done? Scores of cases might be referred to where time, capital and labor have been disgracefully wasted by directors and shareholders through their ignoring the honest advice of experienced miners. It must be understood that shareholders of companies, who are often loud in complaint through the press, and are marvelously dumb at a meeting, are much to blame for not insisting on more publicity of the doings of their company. There is no necessity for so much secrecy in or about gold mining, for where there is much secrecy there must be something underhand; the more light there is let into all mining transactions the better for the industry and those connected with it.

**A TINY ENGINE.**—A small but very interesting article in the mechanical exhibit of the fair is the diminutive horizontal engine constructed by Constant Anger, a watchmaker's apprentice, of this city. It is run every evening at the east end of the gallery, by its youthful constructor, developing about 10 indicated fly power. It covers a space about two inches long, and its tiny rods perform their functions with a gravity and correctness worthy of an engine of larger growth.

SOMEHOW or other every new development of ore in the mines of this or any other camp is always reported as the richest ever discovered in the camp.—*Tombstone Democrat*.

## At the Mechanics' Fair.

A stroll through the machinery department of the Mechanics' Fair does not give the visitor such an idea of the mechanical advancement of San Francisco as those interested in it would wish. Not a single one of the large foundries of this city, for instance, is represented in a special display. What there is on exhibition is very good, but there are too few articles. The chief metropolis of the Pacific Coast ought to do much better in this direction than it has.

The Dow Steam Pump Works have a very creditable exhibit of the various patterns of pumps made. Several of these are of special style and all are of original design. Most of them are constructed under the patents of Mr. Dow. These works have gained an enviable reputation for their different pumps, which are now largely used all over the coast.

The Hendy Machine Works exhibit several patterns of steam engines, one of which was described and illustrated last week.

Ohmen's horizontal and vertical engines, built in this city, also attract attention. The Ohmen-Simmons automatic cut-off has proved itself superior and is well known here.

Thomson & Evans show their deep-well pumps, duplex steam pump, fly-wheel pump, etc. This firm has been in business here for

two or more strokes of the bit are made very easily. The rotation of the drill is automatic and there is a self-feeding attachment. There is no intermediate obstruction to the descent of the drill bar, so the entire force exerted upon it is utilized at the moment the bit strikes the rock. The power is so applied that there is no rebound. The drill can be worked vertically or horizontally or at any angle. The smaller one can be run by one man and the larger by two. We shall shortly give a complete description of this new hand-drill, which has many excellent features to recommend it to our mining community.

An interesting feature in the department of mining machinery of the Mechanics' Fair is the exhibit by S. B. Paige & Co., of the Golden Gate rock-breaker, and also a granulator constructed on similar principles, which is intended to perform the same work as a stamp battery in reducing ore to the requisite fineness for charging into pans, "concentrating," etc. The machines attract much attention from the ease and rapidity with which large lumps of hard quartz can be pulverized to pass through a No. 40 to 60 screen. The plant designed to work 60 tons of ore in 24 hours consists of one rock-breaker and three granulators, the cost of which is stated to be about one-third that of a stamp battery of similar capacity.

THE "MONTANA" MINING TRUCK.

## Saw Dovetailing.

Among the latest and most meritorious improvements in wood-working appliances exhibited at the Mechanics' Fair, are the dovetailing machines at the stand of Ciprico & Marias. They are built from the designs of L. P. Garsin, of this city, and embody many novel features. One machine is designed expressly for cutting a dovetail groove around the edges of windows and doors for the insertion of weather-strips. The cutter used is a small circular saw, to which is given an angular, oscillating motion, independent of its rotary motion. The teeth of the saw cut the groove, and at the same time oscillate on an axis which coincides with the center of the saw, and a wedge-shaped round bottom groove is the result. For making dovetails, where a straight bottom is required, the work is run through a machine which has two saws mounted at opposite angles in a frame, to which a reciprocating motion is given. The dovetail tenon is produced by revolving knives. After the first cut the angle of the table is reversed and the tenons finished to the proper angle. By this ingenious device angular dovetailing of any variety can be produced.

There is exhibited at the same stand a device which can be applied to large wine casks by which any waste of wine is avoided when necessary to change a plug for a faucet, when it is desired to draw off the contents of the cask. Many other mechanical novelties owned by this firm are exhibited.

## Developing Mines.

Of course there are many instances where prospectors find mines which they have no means whatever to develop, and have to sell for what they can get. But there are many men owning claims who could go to work and develop them into mines by mere hard work, as settlers in new countries take barren land and make of it a profitable farm. In this State, where the necessities of life are cheap, and the country is well settled, men can work for wages part of the time, and with their savings during that period, start and work their mines for a number of months. But a good many seem to prefer playing at mining rather than really mining. Simply owning a claim and holding it does not make a miner.

All over this coast there are hundreds of mines which might make their owners rich if they were worked. But too many want to sell, and it is difficult to sell mere prospect holes in these days. In more prominent camps this is better understood than in newer and smaller ones. An illustration of this is given by the *Leadville Herald-Democrat*, which says:

The manner and vigor with which mining properties are opened in Leadville presents a queer contrast, when compared with operations in the smaller camps. Leadville people develop their claims with a view to working them for practical results and making a profit out of the ore extracted. If the vein is small, or low grade, they will follow it up and at once determine its value or worthlessness. A property only partially opened is not considered a mine, and is either made a mine or abandoned as worthless. There is no plodding, tinkering work, calculated to prolong the agony and possibly secure a chance to dispose of it to some tenderfoot. The history of the Silent Friend mine at Monarch finds no parallel here. The owners of the Silent Friend held this property for years, with a slight showing of ore, demanding an exorbitant price. They were afraid to develop the resources uncovered, and hesitated to sell when a good offer was made them. Finally they preferred to take \$13,000 for a property having \$10,000 in sight, rather than do a little work and prove its value of \$100,000. Some of the Red Cliff, Ten Mile and other mines are worked on the same plan. People delay the development of the apparent resources in their properties, and sit waiting for some one to buy them at prices that the mine should be worth, providing the existing showing continues as it should. They are afraid to prove up, and are often foolish enough to think that some one will assume the risk for them. The only instances of sales under such conditions are when an experienced man, who can see further in the ground than the majority, recognizes features that others have failed to observe, and then he usually buys at a song, when, if previous work had been done, he would have paid a handsome price. The owner of a mining property cannot pursue a more foolish policy than to defer the development of his property, when the expense incident can be recovered from the ore extracted. If the discoverer or owner of a mine shows no confidence in its future, strangers cannot certainly be expected to believe in its alleged uncovered resources.

## A Cheap Truck for Mining Purposes.

Mr. E. C. Van Blarcom, of Oakland, but now at Helena, Montana, sends us a sketch of a cheap truck for mining purposes, which he came across in Montana. He calls it the Montana truck.

The frame of the truck is made from 3x6-inch stuff mortised together, as shown in the drawing, the tenon being on the cross pieces, B, as shown in the cut.

Four hardwood blocks, C, 2x3 inches by 6 inches long, are bolted to the frame with one-half-inch bolts, g, as shown in the drawing.

The top of the truck is covered with inch boards, F.

The wheels or rollers, D, are made from a piece of 7 1/2-inch round stuff dressed down to the dimensions given in the drawings.

The gudgeons, E, can either be made of pieces of hardwood, dressed to about 1 1/2 inches in diameter and let into suitable holes in the roller, or they may be made of one-inch round iron. Bearings are bored through the hardwood blocks, C, to accommodate the gudgeons. For a good, stout car the gudgeon should be a one-inch round bar, passing through the entire length of the roller, and long enough to give a good bearing in each one of the hardwood boxes.

The bearing surface, H, of the roller can be reinforced with a band of one-fourth-inch hoop iron. The ends of the band should be brazed together. This truck will run on any ordinary track.

## SCIENTIFIC PROGRESS.

**POSITIVE AND NEGATIVE ELECTRICITY.**—Dr. Wachter, of Vienna, has recently communicated to the Academy of Science in that city a paper in which he attempts to prove that, contrary to the generally accepted belief, crediting positive and negative electricity with absolutely analogous properties differing only in sign, there are between them many points of diversity. He maintains that the properties of the two electricities are totally different, and these differences manifest themselves in regard to (1) equipotential surfaces, (2) direction of movement, (3) magnetic, (4) thermic, and (5) optic properties; also (6) in regard to the substances electrified. Dr. Wachter treats only of the first and second headings. He asserts that in conductors of great specific resistance the point where the potential has a mean value lies, not midway between the extreme ends of the conductor, but somewhat nearer the negative end. If equal quantities of positive and negative electricity accumulate respectively on two conductors of equal size, the potential, measured by means of an electrometer, has a greater value, irrespective of the sign, on the positive than on the negative conductor. The electric mill revolves in the direction of the flow of positive electricity, which proves that the movement of the molecules of air around a positive and negative point is different. The appearance of the discharge from such points is also different, indicating an inequality in the equipotential surfaces.

**ELECTRIC MOTORS IN MINES.**—Electricity has for some time been employed by the Trafalgar Colliery Company for underground ventilating and pumping with so much success that it was resolved to extend the use of this agent also to its underground railroads. In Germany there are several collieries so worked, but in these cases the current was sent to the locomotive by fixed conductors. In the Trafalgar colliery the electric locomotive carries its own stores of current with it in a series of accumulators, the weight of which represents so much useful adhesive weight on the rails. Where the underground lines have sharp curves, haulage of trains by wire ropes presents great difficulties, and horses are generally employed. This locomotive has been designed by Mr. A. Reckenzaun, and has been in use for several weeks. The construction of the motor and driving gear is similar to that adopted in electric street cars, but the conditions to be satisfied were widely different and more difficult than those obtaining in an ordinary tramway. The space is very limited, and since both sharp curves and heavy gradients occur at frequent intervals, it was somewhat difficult to stow away the necessary power in so limited a space. Within the narrow gauge of two feet seven inches, and an extremely short wheel base, there had to be arranged an electro-motor of 8 horse power, with suitable gearing brakes and attendant details.

**THE SIZE OF A SPIDER'S THREAD.**—Although it is generally known that a spider's thread is exceedingly fine, still very few have any adequate idea of its extreme minuteness. If we take a hundred spider threads and combine them into one and place the combined threads across the field of a microscope, and then place by its side a single human hair of ordinary fineness, the latter will appear of much larger diameter. Indeed, some have asserted that if 100 spider threads, so multiplied, could be closely spun into one, it would not present a greater diameter than a single human hair—the latter would in such a case be equal in size to 10,000 spider threads. If to this we add the well-known fact that the thread of the full-grown spider must be two or three hundred times larger than that of a young spider when it begins to spin its first threads, we have the astonishing fact that the ordinary human hair must be from two to three million times larger than the finest thread of the spider. We should also remember that every spider thread is composed of from five to eight separate filaments, as they come from the body of the insect. What incredible minuteness, and how little do we know of the works of Nature!

**UTILIZING THE HEAT OF THE SUN.**—With a view of utilizing the heat of the sun, which is a source of power and warmth, investigations are still going on in several countries among scientific men, more especially in France and in this country. One of the most interesting and practical methods in this direction is that devised a little while ago by Prof. Morse, of Salem, Mass., the limitations of which, it is hoped, may be overcome by future improvements. The device consists simply of a shallow box, the bottom of which is of corrugated iron, and the top of glass. This is placed outside the building in such a position that the sun shines directly upon it, the heat rays of the sun pass through the glass and are absorbed by the iron, heating it to quite a high temperature, and by a system of ventilation a current of air is passed through the apparatus and into the room to be heated. By this means the air was heated, on pleasant days, to about 90 degrees by passing over the iron.—*Boston Journal of Commerce.*

**A LAYER OF COAL.**—According to the calculations made by a scientific writer, lately, it requires a prodigious amount of vegetable matter to form a layer of coal, the estimate being

that it would really take a million years to form a coal bed 100 feet thick. The United States has an area of between 300,000 and 400,000 square miles of coal fields, 100,000,000 tons of coal being mined from these fields in one year, or enough to run a ring around the earth at the equator  $5\frac{1}{2}$  feet wide and  $5\frac{1}{2}$  feet thick, the quantity being sufficient to supply the whole world for a period of 1500 to 2000 years.

**EARTH TEMPERATURES.**—A remarkable example of the increase of temperature in the earth toward the center has been presented at Pesth, where the deepest artesian well in the world is that now being bored for the purpose of supplying the public baths and other establishments with hot water. A depth of 3120 feet has already been reached, and it furnishes 176,000 gallons daily, at a temperature of 158° F. The municipality have recently voted a large subvention in order that the boring may be continued to a greater depth, not only to obtain a large volume of water, but at a temperature of 176° F. It is suggested that it is thus within the bounds of probability that the time may come when a brewer will obtain his water supply from a well of sufficient depth to yield "liquor" at the mashing temperature.

**BALLISTIC PHOTOGRAPHY.**—It is said that Krupp, of Essen, is making preparations to make extensive use of the photograph in the solution of some important ballistic operations. He is to employ an expert who will devote his attention chiefly to taking photographs of projectiles in transit, the recoil of gun carriages, the penetration of armor plates by projectiles and similar phases in artillery practice, all in the interest of the German Admiralty. As projectiles have an average velocity of 1500 feet per second, the obstacles to be overcome in obtaining satisfactory photographs are very great, and the most delicate apparatus must be used, in the manipulation of which, however, Mr. Anschütz, the expert, is said to be a great proficient.

**WOMAN IN SCIENCE.**—A regulation as old as the French Academy of Sciences has just been broken through in Paris. Women have hitherto been excluded from the sittings of the Academy, but at the meeting of June 28th the interdiction was raised in favor of Mlle. Sophie Kowlewska, professor of mathematics at the University of Stockholm, and daughter of the eminent paleontologist. Admiral Jurien de la Graviere, who presided, welcomed her in graceful terms, and said that her presence should be a cause of pride and pleasure, not only to the mathematicians present but to the whole Academy. As she entered, the whole of the members rose to salute her. She took her place between Gen. Fave and M. Chevreul.

**HOW TO MEASURE A CANDLE-POWER.**—The measuring of the candle-power of a light is accomplished by comparing the shadow cast by a rod in the light of a standard candle with the shadow cast by the light to be tested. By moving the latter toward or away from the rod a point will be reached at which the shadow cast by both lights will be of the same intensity. The intensities of the two lights are directly proportional to the squares of their distances from the shadows, i. e., suppose the light to be tested is three times the distance of the candle, its illuminating power is nine times as great.

**FLUTED CARBONS.**—We understand that in England a new form of carbons has been brought out for arc lighting. These are held to give a higher efficiency than the ordinary cylindrical pencils now used, and to be especially applicable to the electric illumination of lighthouses. The carbons are fluted down the sides, and are made in molds and baked, much in the same way as ordinary cylindrical carbons. The greater efficiency is mainly due to the fact that the new carbons do not "crater" at the points, and hence there is not the same loss of light from that cause as occurs in the round carbons. Many experiments have been made with them with good results.

**HOW TO SEPARATE THE LAYERS OF INSECT'S WINGS.**—A wing that has never been dried is placed in 70 per cent alcohol, then into absolute alcohol, and after a few days' immersion into turpentine. After remaining a day or two in turpentine, the specimen is plunged suddenly into hot water, when the conversion of the turpentine into vapor between the two layers of the wing so far separates those layers that they can be easily parted and mounted in the usual way, as microscopical preparations on a slide.

**HIGHT OF TWILIGHT.**—By observing how far the sun has to sink beneath the horizon before the topmost summit of the air is cut off from its rays, Mons. Bravais, some years ago, determined the greatest upward limit of twilight to be 378,000 feet, or nearly 71 miles above sea-level. By observing the earth's shadow on the moon during eclipses, astronomers had inferred that the atmosphere must be sufficiently dense to produce twilight for at least 240,000 feet away from the earth's surface.

**GLACIERS.** the ice-rivers of lofty mountains, have been found to move downward from one or two inches to over 50 a day, from 10 to 20 inches a day in summer being most common. The rate in winter is about half that of summer.

## MECHANICAL PROGRESS.

## Modern Progress.

With the tendency to rapid progress and improvement so characteristic of modern times, says the *Mechanical World*, when one discovery follows so rapidly upon the heels of another in almost every branch of applied science, and when one invention has barely time to establish its claim to pre-eminence ere it is superseded by something newer and better, there is fortunately a growing disposition on all sides to communicate and disseminate useful information as widely as possible. Exceptions there will, of course, always be found to every rule; and although some firms with specialties of manufacture may be here and there met with, who are very jealous of any outsider knowing how they conduct their business, yet as a rule it will be found that those who are the most unwilling to communicate information to others are those who have least to boast of. While formerly it was the rule to work almost everywhere with closed doors, all strangers being jealously excluded, we now find that those firms who possess well-ordered shops, fitted up with every modern improvement in the way of machinery, tools, etc., are nowadays only too proud to show visitors over their establishments, and the principals take pleasure in pointing out and enlarging upon the merits and excellence of special machinery, and in showing how rapidly and with what excellence their goods can be produced. They have learned that isolation means stagnation or retrogression, and do not fear but court criticism which may open their eyes to defects they had not previously thought of, and thus pave the way to further improvement and advancement. Nowadays, when competition is so keen, and everything seems to be moving at express speed and under high pressure, isolation, unless for some unusually exceptional object, certainly does not pay, and the most successful business men know that it is absolutely necessary to keep pace with the times—know what is going on around them, and adopt really sterling improvements as they are made, or otherwise make way for those who do. Hence, free intercourse, the interchange of ideas and knowledge, are essential to progress, and throughout all the ramifications of business, and indeed of society, this principle is becoming more and more clearly recognized. He who knows least is the most jealous of the little knowledge he possesses, and is least communicative, lest others should get to know as much as he does. On the other hand, the really thoughtful and ingenious, those who are continually adding to the sum of human knowledge, are they who delight in enlightening others on any point on which they have any special information, or which they have with difficulty thought out for themselves. The periodical publications of the press, and especially the scientific and technical journals, form the principal medium by which the newest information is disseminated, and the latest achievements in any particular direction are made known to the world; and the literature of our own time is nowadays mostly written first of all for some enterprising publication, and published week by week, or month by month, before being made up, as formerly, in book form. Knowledge of most kinds, and especially technical knowledge, is acquired so rapidly that if it is to be published as original it must be made known almost as soon as acquired. Hence the proprietors of enterprising journals are always on the lookout for specialists, or for any who have the reputation of being particularly knowing on subjects on which information is required, or who have exceptional opportunities and facilities for acquiring experience.

**AFRICAN BLACKSMITHS.**—In a recently-published account of a journey to Kilimajaro, Africa, H. H. Johnson describes the natives of some parts of Africa as clever smiths, who forge all kinds of tools, arms and decorative articles from pig iron, which is brought from the country of Usanga, near Lake Jipe. The forge consists simply of a pair of goat-skin bellows, converging into a hollow cone of wood, which is supplemented by two segments of stone, penetrated through the center and terminating in a stone nozzle, which is thrust into the furnace of charcoal. "The bellows," he says, "are kept steady by pegs thrust into the ground, and a huge stone is often placed on the pipe to keep it firm. After the iron has been heated white hot in the charcoal, it is taken out by the iron pincers and beaten on a stone anvil." The Chaga smiths, we are told, not only make spear-blades and knives of apparently tempered steel but can fabricate the finest and most delicate chains. The "pig iron" used by these natives is, of course, a very different metal from that which is termed pig iron in this country and Europe.

**SIMPLIFICATION OF MACHINERY.**—Complexity in a machine is always, if possible, to be avoided. The user, who often is not a practical machinist, finds himself in frequent difficulties owing to the mechanism getting out of order, and is caused delay, inconvenience and expense in having the necessary repairs executed. This is a point which has of late years been kept in view by our leading engineers, who work on the basis that the more simple a machine the more satisfactory it is. The *American Machinist* in this connection points out that machines as first constructed are usually more or less complex,

and invention plays a prominent part in simplifying as in originally creating the device. It often happens that when other heads study the machine they are able to improve it by dispensing with a large quantity of the mechanism required by the inventor to perform a given action. A button-hole machine of very complicated design was recently presented to a machine manufacturer, with the request that he should bid for a contract to make the machines in quantity. It was stated to the writer, by the manufacturer in question, that should he contract to make the machines, about one-half the present complicated mechanism of the machine would at once be discarded, yet all operations now performed by the machine would still be executed. In another case, by the same manufacturer, three machines were required to do, in three distinct operations, certain work on articles made of sheet tin. By the simplifying method, two machines were dispensed with, and all three operations performed practically at the same time by one machine. These methods are the true ways of reducing cost of manufacture. It may be also added that true invention as applied to machinery lies not in scheming out a complicated mechanical device for performing given operations, but in reducing the whole matter to its lowest mechanical terms.

**IS IRON TO BE SUPERSEDED?**—Iron is the foundation of the civilization of to-day, the indispensable condition of all commerce and manufacture, without which no industry could exist an hour. Probably none of us have ever imagined that another state of things was possible. Yet there comes a man of science prophesying, not an iron famine, but a new king of industry who expects to depose King Iron. Iron is to be "as completely superseded as the stone of the aborigines." Certainly there is a strong case made out for the new metal—aluminum. First, it is the most abundant of all substances, with the exception of oxygen and silicon. The question has hitherto been how to separate it from the compounds, but no American will doubt that, being in the earth's crust, it can and will be got out when it shall be demanded. Aluminum is light as chalk, malleable as gold, tenacious as iron, and harder than steel. It is soft when ductility, fibrous when tenacity, and crystallizes when hardness, are required. It neither rusts nor tarnishes, is tasteless and odorless, makes numerous and satisfactory alloys, has bulk without weight, strength without size, and conductivity far exceeding that of iron. Its use will open limitless prospects in all directions. All departments of building, furnishing and utensils, plumbing, bridges, railways, steamships and telegraphs would be revolutionized, and transportation gain incalculably in speed, safety and economy. Already the price has been brought within reach of the manufacturing arts, and the process of increasing the production and decreasing the cost is constantly going on.—*Er.*

**GAS CHEATING—AN INVENTION GREATLY NEEDED.**—The great desideratum, says a contemporary, is a good and true gas meter that cannot be manipulated by the gas company. It may seem easy to measure gas; theoretically, the gas meter of the day is an automatic measurer that won't record an error and cannot be made to deceive. But many people believe that as a measurer, good and true, without partiality or favor, the meter of the day is wholly unreliable—that is, on the consumer's side. Just now the New York people are greatly excited over this matter. It is alleged that the cheaper the gas per 1000 feet the higher the consumer's bills. Nor is this mere assertion, because abundant facts are adduced to prove the statement. So some method or plan is getting to be urgently demanded that will do justice to consumer and manufacturer.

Right at this line the developments before the late Senate Committee about the Washington Gas Light Company are somewhat startling. It is asserted that only about \$50,000 was paid in to make the capital of this company some 30 years ago, and yet for years it has been paying enormous dividends on millions of capital! The true inwardness of this financial success is asserted to be a skilled knowledge of the proper methods of mixing coal and water gas and forcing the compound through the meter. Evidence was adduced before the committee to show that the result complained of in New York was reached in other localities—the cheaper the gas the higher the consumer's bills.

**LARGE PLANING MACHINE.**—Messrs. Killock & Galbraith, engineers, Glasgow, Scotland, are at present constructing a planing machine which is said to be the largest of the kind ever made. When finished, this machine will weigh 35 tons, and it is to be capable of planing the edge of a plate of 38 feet in length by five feet wide. It is specially intended to be employed in connection with the preparation of steel plates for the girders of a railway bridge which is about to be erected across a river in New South Wales.

**A NEW TELEGRAPH WIRE.**—As is generally known, compound telegraph wires consist of copper deposited upon iron and steel. A wire, however, is now being brought out in England in which the relation of the two metals is reversed, the steel surrounding the copper. The wire is said to be drawn from compound metal consisting of a hollow ingot of steel filled with copper.

## ENGINEERING NOTES.

## A New Boat-propelling Device.

We are indebted to the *Albany Journal* for the following description of the propulsion of a boat by gas generated from crude petroleum: The principal feature of the engine is that it dispenses with a boiler and burns crude petroleum instead of coal, and that it is run by hydro-carbon gas, generated by the petroleum with condensed air. In the case of the engine particularly described, there was no complicated machinery to get out of order, and the machine ran very easily. It was seen on board a small boat on a trip up the Hudson river, and described as follows: The engine proper is all inclosed in an oblong drum in the center of an engine-room. This drum is a heavy cast-iron shell 40x21 inches, inclosing two cylinders, each 15x15 inches. Each of the cylinders is inclosed by a jacket, and the space between it and the jacket is kept full of cold water. In the middle of the top of the drum is what is known as the fire chamber, with valves opening into the cylinders. In this chamber is a perforated metal disk which is covered with a kind of wicking. This wicking is supplied with oil from a tiny supply pipe that admits a few drops at a time. Another supply pipe of similar dimensions admits the air from a neighboring tank. When the fire is to be started, a small lever at the side of the chamber is pushed to one side, disclosing a vent, to which the light is applied. There is no waiting to get up steam, for as soon as the fire is lighted the engine is ready to start. The cylinders are connected with the propeller shaft by cranks from the bottom. At the side of the engine-room are the oil and air tanks. Of the former, there is one having a capacity of 60 gallons. Of the latter, there are three—two reserves and a working tank. A pressure of 90 pounds is kept on the air tanks. In the engine-room are two long levers. By using one the boat is started ahead. By the other the engine is reversed, and when neither is touched the engine runs free without turning the propeller. The connection of the shaft with the propeller is by a friction clutch, which is thrown on or off by the movement of the levers. With everything in perfect condition, the engine running at full speed makes 112 turns of the propeller per minute. The pistons are driven by the expansion of the hydro-carbon gas precisely the same as by steam, and not by the explosion of the gas. The gas exhausts into a large tank in the stern, which causes a hoarse, coughing sound.

## New Canals in Russia.

Russia seems to be very active in improving the various routes of communication between the different and more distant points in her vast domain. Where railroads are impracticable or too expensive, canals, with improved means of canal transportation, are provided. A new canal, improving the water communication between the Caspian and the Baltic, was opened by the Minister of Ways of Communication, Gen. Possiet, recently. The canal, which has cost \$1,500,000, joins the rivers Wyhegra and Kovja, and forms a fresh link in the chain of waterways connecting the Neva with the Volga. Its length is 15 miles, width 70 feet, and depth seven feet. Some of the cuttings through which it runs had to be excavated to the depth of 30 feet. Most of the work has been done by hand, upward of 20,000 laborers having been employed in the undertaking, together with three dredging machines, nine stationary engines and two locomotives.

Compared with the rest of the vast canal system between the Neva and Volga, the new link was neither an extensive nor a formidable undertaking, but it has relieved the pressure of traffic on the other canals, and shortened the distance from Rybinsk to St. Petersburg.

It is noteworthy, says *Engineering*, that in spite of the development of the Russian railway system the traffic on the canals shows no sign of diminution, a phenomenon quite the reverse of what has occurred in England. This is to be explained, perhaps, by the fact that distances are greater in Russia, while the canals are more like rivers than the narrow waterways common to England.

Barges on Russian rivers and canals range in length from 100 to 300 feet. The cargoes a large proportion of them carry are as large as many an ocean cargo; and instead of being mere lighters, carrying only portions of cargoes, they are to all intents and purposes the counterparts of ocean-going ships.

THE HENNEPIN CANAL SCHEME for connecting the Great Lakes with the Mississippi river has received a lift by the passage of a bill by the United States Senate, appropriating \$300,000 toward the proposed work. The scheme is for the opening of a waterway between Lake Michigan and the Mississippi river by the construction of some 75 miles of ship canal and the deepening of the existing Illinois and Michigan canal and a portion of the Illinois river. As the entire cost is estimated at from \$6,000,000 to \$8,000,000, the appropriation will not insure its very speedy completion.

HIGH-SPEED SHIPS.—Sanguine engineers are predicting that steamships will soon be built which will be able to make from 40 to 50 miles an hour.

## USEFUL INFORMATION.

A LUBRICANT FOR BRASS WORK.—Writing to *Nature* regarding various fats which are used to smooth and bind the surfaces of various kinds of apparatus, such as air-pumps, stop-cocks, etc., Mr. H. G. Madan says: "Melted india rubber answers fairly, but it has too little 'body' and too much glutinosity; moreover, it does, undoubtedly, in course of time, harden into a brittle, resinous substance. Vaseline is quite without action on brass, and never hardens; but it has not sufficient tenacity and adhesiveness. A mixture of two parts by weight of vaseline (the common thick brown kind) and one part of melted india rubber seems to combine the good qualities of both without the drawbacks of either. The india rubber should, of course, be pure (not vulcanized), and should be cut up into shreds and melted at the lowest possible temperature in an iron cup, being constantly pressed down against the hot surface and stirred until a uniform glutinous mass is obtained. Then the proper weight of vaseline should be added, and the whole thoroughly stirred together. This may be left on an air-pump plate for, at any rate, a couple of years without perceptible alteration, either in itself or the brass."

IMITATION VERMILION.—An imitation product, which for all practical purposes may replace the genuine one, may be prepared after the following formula: Dissolve in warm water, previously made weakly alkaline by the addition of a small quantity of soda, from 3 to 10 kilos. (6.6 to 22 pounds) of eosine (the quantity used must be regulated by the price which the product will bring). To this solution (which should properly contain about 5 kilos. of water to 1 kilo. of eosine) should be added, with constant stirring, 100 kilos. of the finest red lead (minimum). To this should be added from 3 to 12 kilos. of acetate of lead or nitrate of lead dissolved in warm water (the quantity of red lead must be gauged by that of the eosine). The mass is now filtered, the moisture expressed by a suitable press, and the press cake cut into small pieces and rapidly dried, preferably in a drying-chamber, specially provided. After thoroughly drying, the product is finely ground and sieved, when it is ready for use.

THE ADHESIVENESS OF IRON OXIDE CEMENT.—One of the most adhesive and durable of cements for uniting iron surfaces is found to be the oxide of iron itself. With this a joint can be made so perfect and sound that the iron will break before the cement will part. As an illustration of this statement the fact is cited that, in removing the cast iron pipe of a bilge pump from a ship that had made four Atlantic voyages, it was found necessary to take the sections apart; the flanges had been pasted with a cement of cast-iron drillings and filings mixed with sulphur and sal-ammoniac moistened with water; then the nuts, three in each flange, were set up on the bolts, and the union was completed. The four voyages occupied nearly a year, and, on the separation of the parts being attempted, even the cold-chisel failed to make a division between the solid castings and the cements that intervened.

HOW TO GRASS A BANK.—There is a German method to grass a bank. For each square rod to be planted take one-half pound of lawn grass seed, and mix it intimately and thoroughly with six cubic feet of good dry garden earth and loam. This should be placed in a tub, and liquid manure diluted with about two-thirds of water added and well stirred in, so as to bring the whole to the consistency of mortar. The slope must be cleaned and made perfectly smooth, and then well watered, after which the paste just mentioned should be applied with a trowel and made as even and thin as possible. Should it crack from exposure to the air it must be again watered and smoothed up day by day until the grass makes its appearance, which will be in from eight to fourteen days, when the whole declivity will soon be covered with a close carpet of green.

BAY WINDOW CARS.—About a quarter of a century ago the railroad which was then known as the New York & New Haven Railroad built three passenger coaches with bay windows. It was thought that these bay windows would prevent people from extending their heads out of the car, and thus prevent injuries to passengers. This object was accomplished, but the glass in these windows broke so often that repairs had to be made almost every day. Consequently the three cars were discarded by the company and sold. One of these cars is now doing duty as a match factory near the railroad junction at Saybrook, Conn. The timbers of the old car are still sound.

GREEN VARNISH FOR METALS.—For a green transparent varnish for metals grind a small quantity of finely powdered chromate of potash (it requires the most elaborate grinding); add a sufficient quantity of copal varnish thinned with turpentine. The tone may be altered by adding more or less of one or the other ingredients.

STRETCHING EMERY CLOTH.—An ingenious device for stretching emery cloth for use in workshops consists of a couple of strips of wood about 14 inches long, hinged longitudinally,

and of round, half round, triangular, or any other shape in cross section. On the inside faces of the wood strips are pointed studs, taking into holes in the opposite side. The strip of emery cloth is laid on to one set of the studs, and the file, as it is called, closed, which fixes the strip on one side. It is then similarly fixed on the other side, and thus constitutes what is called an emery file, and which is a handy and convenient arrangement for workshop use.

HOW TO TIN CLOTH.—A mixture of finely pulverized metallic zinc and albumen, of about the consistency of a thin paste, is spread with a brush upon linen or cotton cloth, and by means of hot steam coagulated. The cloth is now immersed in a bath of stannic chloride, well washed and dried. Running the cloth through a roller press, the tin film is said to take metallic luster. Designs cut in stout paper, letters, numbers, etc., when laid between cloth and roller, are impressed upon it. It can also be cut in strips, corners, etc.

TO CONSTRUCT A RAIN GAUGE.—Take a glass tube of suitable diameter and length, close the lower end with a cork, covered as inserted with melted sealing wax. Then set it in an upright position away from houses, preferably on top of a post. Fit a tin funnel to its top and divide it, making the divisions in the ratio of the squares of the diameters of the tube and funnel mouth. Thus, if the funnel is 3 inches, then magnify the division in the ratio of  $3^2$  to  $\frac{1}{2}^2$  or as 9:25-64=576:25 or 23:1 nearly.

LUSTROUS POLISH FOR CABINET WORK.—A fine, lustrous polish for delicate cabinet work can be made as follows: Half pint linseed oil, half pint of old ale, the white of an egg, one ounce spirits of wine, one ounce spirits of salts. Shake well before using. A little to be applied to the face of a soft linen pad, and lightly rubbed for a minute or two over the article to be restored, which should be first rubbed off with an old silk handkerchief. It will keep any length of time if well corked.

FITTING KEYS.—Fitting a key, says the *American Machinist*, is a good test of a working machinist's ability. Set 50 men to fitting 50 keys, or splines to the same key-way. When they are all done, you will not find three keys which fit alike. A key must fill the hole completely, or it is useless. If it bears a ridge here, a lump there, or is full of small places, the key is of no use. Make a sliding fit on sides of key and driving fit on top and bottom for most purposes.

A NEW PATENT DODGE.—Persons in the Patent Office say there have been several cases in which the owners of an expiring patent have induced some other person to get up an interference and claim priority of invention. Then the first patentee made no defense, patents were issued to the new applicant, who immediately, in accordance with a prearranged plan, assigned his patent to the original patentee, who thus secured a 17-years' extension of his monopoly.

ARTESIAN WELLS were known at Thebes 2000 years before the Christian era.

## GOOD HEALTH.

## One Secret of Right Living.

A large number of professors of athletics or athletic professors met recently in the gymnasium of the Adelphi Academy, Brooklyn, N. Y., to teach the human race how to keep well and live forever. On the subject of physical exercise most people are fools. A man without a muscle is as bad off in this rough-and-tumble world as a man without a brain. Parents take pride in their children when their heads are packed like a pawnbroker's shop with all sorts of odds and ends of information, but they do too little to encourage the symmetrical development of their bodies. They forget that robust health constitutes about three-fourths of the problem of human happiness, and that it is criminal neglect of the boy and girl to keep them at their books until they lose all appetite for out-of-door sports.

Half the men in the world are broken down with dyspepsia and the other half are broken up with rheumatism. The women, who are not supposed to have any muscles, indulge in the luxuries of sick headache and neuralgia. A half hour's vigorous exercise in the morning before the business of the day begins, a brisk walk of a few miles, would sweeten the temper and make life worth living. Such is our physical condition, however, that if you should turn the gentlemen of Wall street into a gymnasium for an hour's torture with the parallel bars and 50-pound dumb bells and the inspiring trapeze, you would have to pick them up from the floor like chestnuts under a tree after a gale of wind. Our clerks, and their employers also, after a three-hours' trot on a hard road, with a leap here and there over a fence or ditch, would have to be brought home in furniture wagons and a large proportion of them deposited at the undertaker's. We have not yet learned the secret of right living. No man lives well who does not spend hours every day out of doors. We are asthmatic, rheumatic, spleeny, and hard to get along with at home because we believe in brains and not in bodies.—*New York Herald*.

A BLAST AGAINST BEER.—For some years a decided inclination has been apparent all over the country to give up the use of whisky and other strong alcohols, using as a substitute beer and other compounds. This is evidently founded on the idea that beer is not harmful, and contains a large amount of nutriment; also that bitters may have some medicinal quality which will neutralize the alcohol which it conceals, etc. These theories are without confirmation in the observation of physicians. The use of beer is found to produce a species of degeneration of all the organs; profound and deceptive fatty deposits, diminished circulation, condition of congestion and perversion of functional activities, local inflammations of both the liver and kidneys, are constantly present. Intellectually, a stupor amounting almost to paralysis arrests the reason, changing all the higher faculties into a mere animalism, sensual, selfish, sluggish, varied only with paroxysms of anger that are senseless and brutal. In appearance the beer-drinker may be the picture of health, but in reality he is most incapable of resisting disease. A slight injury, a severe cold, or a shock to the body or mind, will commonly provoke acute disease, ending fatally. Compared with inebriates who use different kinds of alcohol, he is more incurable and more generally diseased. The constant use of beer every day gives the system no recuperation, but steadily lowers the vital forces. It is our observation that beer-drinking in this country produces the very lowest kind of inebriety, closely allied to criminal insanity. The most dangerous class of ruffians in our cities are beer-drinkers.—*Scientific American*.

DISEASED EGGS.—Dr. D. F. Wright, in the *Bulletin of the Tennessee State Board of Health*, says that soon after it became the practice to transport eggs in large quantities and to long distances by railway trains, it was found on their arrival that adhesion had taken place between the membranes of the yolk and those of the shell, so that the yolk could not be turned out of the shell unbroken. On examination by experienced pathologists, this was found to be the result of true inflammation; the material of the adhesion was found to be precisely the same as that of the plastic exudation in inflammation of the lungs or bowels. It will at first seem absurd to speak of inflammation in such an unformed mass as an egg; but this arises from our forgetting that structureless and unorganized as it seems to be, the egg, even when fresh laid, is a living being, and capable of disease from external causes. The cause of this inflammation is the shaking and friction which it suffers from the motion of the cars. Such inflammation cannot fail to render the egg more or less unhealthy and not as salutary for food as those that are freshly laid and have not been subjected to distant transportation.

WONDERS OF DIET.—The Roman soldiers, who built such wonderful roads and carried such a weight of armor that would crush the average farm hand, lived on coarse brown bread and sour wine. They were temperate in diet, regular and constant in exercise. The Spanish peasant works every day and dances half the night, yet eats only his black bread, onion and watermelon. The Smyrna porter eats only a little fruit and some olives. He eats no beef, pork or mutton, yet he walks off with his load of 800 pounds. The coolie fed on rice is more active and can endure more than the negro fed on fat meat. The heavy work of the world is not done by men who eat the greatest quantity. The fastest and longest-winded horse is not the greatest eater. Moderation in diet seems to be the prerequisite for endurance.

SALT AND WATER FOR THE FEET.—If the feet are tender and painful after long standing or walking, great relief may be obtained by bathing them in warm salt and water. A handful of salt to a gallon of water as warm as can be borne is the proper proportion. The feet should be immersed and the water thrown over them with the hand, and also over the legs as far as the knees. When the water becomes too cool, dry the feet and legs, rubbing with a coarse towel upward. Neuralgia of the feet has been cured by perseverance in this method night and morning. It is also said that persons with weak lungs or bronchia, as well as weak throats, are wonderfully benefited by gargling every morning with strong salt and water.

TURPENTINE AS A REMEDY FOR LOCK-JAW.—Let any one who has an attack of lock-jaw, says an exchange, take a small quantity of turpentine, warm it and pour it on the wound, no matter where the wound is, and relief will follow in less than a minute. Nothing better can be applied to a severe cut or bruise than cold turpentine; it will give certain relief almost instantly. Turpentine is almost a certain remedy for croup. Saturate a piece of flannel with it and put it on the chest, and in a very severe case three or four drops on a lump of sugar may be taken inwardly. Every family should have a bottle on hand.

VENTILATING A ROOM.—According to Gen. Morin, the eminent French expert, the proper temperature in well-ventilated places is as follows: Nurseries, asylums and schools, 69°; workshops, barracks and prisons, 50°; hospitals, 61° to 64°; theaters and lecture-rooms, 66° to 69°. In dwellings in this country it has been the custom to keep the temperature at 65° to 70°.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—*Ledger*, Sept. 11: The Eureka shaft is stripped of everything. The pump was taken out and laid on the surface the latter part of last week; the shaft was then covered over and securely spiked down. A keg of beer and other refreshments were on the ground, and a jollification was had over the event. There are now two or three men at work tearing down the old 40-stamp mill. It will be quite a job, and will take about a month to complete it. It is said that everything is for sale, but whether the ropes and tools which would be indispensable in sinking a new shaft, or carrying on further operations, are included, I am unable to say. From the public rumors which are afloat, it looks as though the mine is to be permanently and totally abandoned. G. W. Horn has returned from the city and is again at work driving the tunnel in the Mahoney hill. The ledge has been struck, and it is likely they will not drift much further. They have an abundance of pay rock in sight, and the mill is likely to start at any time. A slight accident occurred at the South Spring Hill mine last week. The pinion of a spur wheel broke, thereby bringing everything at the hoisting works to a standstill for a few days. Everything is in running order again at this writing. We had pay day at the Lincoln this week, which helped to enliven the town for a few days.

## Butte.

**ANOTHER TUNNEL.**—*Oroville Mercury*, Sept. 11: We are informed that the Spring Valley Mining Company, at Cherokee, are about to commence operations upon another large tunnel. The intentions of the company are to start at some point in the main tunnel and run at right angles under the main mountain, where a large body of rich gravel is known to exist. The work will give employment to a large number of men.

## Calaveras.

**TO BUILD A MILL.**—*Calaveras Chronicle*, Sept. 11: The Banner sawmill, near El Dorado, has received a contract to deliver 150,000 feet of lumber to the mine formerly known as the Rathgeb mine near Fourth Crossing, the proprietors of which intend erecting a 30-stamp mill.

## El Dorado.

**FRENCH CREEK NOTES.**—*Republican*, Sept. 9: It seems that the Oro Fino mine is about to commence work at last. It is said that a part of the machinery is on the way and that men are being engaged to work. The Vandalla mine is at rest for the present.

**GARDEN VALLEY.**—The Lone Jack mine near this place is erecting a ten-stamp mill. Machinery is being delivered, and I am informed that the mill will be in operation within 30 days. The Taylor mine will commence taking out water to-morrow. The Hart mine is running a tunnel to cut the ledge, and work is progressing favorably. The Alpine mine is looking and prospecting favorably. Sulphurets are very high grade. Defiance mine is at work and paying a good margin. Sinking will be resumed on the Esperanza mine next week.

**LATROBE.**—Yesterday I paid the Big Canyon gold mine a visit. It was formerly known as the Oro Fino. The owners have been at work for some time past and have prospected the mine thoroughly. They have found a large body of ore 30 feet wide that will pay, and the best evidence is they have made a contract with the Union Iron Works, of San Francisco, for a 20-stamp mill with all the latest improvements; weight of stamps, 750 pounds. The contract calls for the mill to be completed in 60 days. Kennedy & Bargin, the owners of the mine, are both energetic and have worked hard to develop the property. They have also had quite a struggle in the courts, but still they go ahead.

**PURCHASED.**—*Placerville Observer*, Sept. 11: Ex-Governor Geo. C. Perkins, Hon. J. H. Neff, and other capitalists of this State, have purchased the northern extension of the Springfield mine, in Mud Springs township, and intend thoroughly prospecting it. Work has already been commenced, and those who know the members of the company have no thought but that they mean business. With the work being done at the Grand Victory, McNulty, Springfield and Springfield northern extension, it begins to look as if there was a mining boom near at hand.

**M McNULTY.**—D. W. C. Morgan, of San Francisco, is the new superintendent of the McNulty mine in Mud Springs township. This mine has been bought by a company of Eastern capitalists and it is intended to sink on it to a depth of, at least, 1200 feet. Not being able to get sufficient seasoned timbers in this county, a contract has been let to Towle Bros., of Placer county, who are now shipping timbers to Shingle Springs by way of Sacramento. Mr. Morgan is a mining man of large experience, who expresses the utmost faith that the McNulty will be one of the best mines in California. He thinks so at least to the extent of inducing his company to risk a \$50,000 plant on it.

## Inyo.

**RICH ORE.**—*Independent*, Sept. 11: A few days ago Domenico Galscia brought to Keeler a sample lot of 2200 pounds of ore, worth over \$400 a ton. The ore came from Beveridge district and was sent to Selby & Co., San Francisco.

**WHAT SAVES US.**—All that saves the silver mines of Inyo county from the ruin that has come upon the mines in Nevada and other States and Territories is that our ores carry a great deal of lead. The value of the lead added to the silver enables the miners of Inyo to work their mines, when ores that carry little lead, or none at all, cannot be worked except at a loss. All the mines of Inyo county are being worked as vigorously as ever, though of course at reduced profit. The mines make just as good a market for farm produce as before the recent heavy decline in the value of silver.

## Mono.

**GETTING READY.**—*Bodie Miner*, Sept. 10: The Bodie tunnel mill is getting in good shape to commence crushing ore and producing bullion.

## Nevada.

**NORTH STAR.**—*Grass Valley Union*, Sept. 9: The North Star mine is looking remarkably well in its lowest workings. The old mine gives promise of being better than it ever was in its palmiest days. A 20-stamp mill is one of the projected improvements upon the mine. Very fine milling quartz is now coming out of the Pennsylvania, which shows well in free gold and carries plenty of sulphurets. The owners of the Pennsylvania are in excellent spirits over the flattering prospects. Quartz mining is very active in the Grass Valley district at the present time. The Idaho, Empire, North Star and Crown Point are all yielding regular profits, and the prospecting mines, almost without an exception, are giving good returns from the quartz sent to the mill. The Grass Valley mines stand second to none in the State.

**MILL.**—*North San Juan Times*, Sept. 11: The crushing mill on the Boss mine was started up on Friday and it runs well. It is equal to its recommendation and works like a charm. It is run by a small Pelton wheel and water-power. It will crush and grind about 13 tons of rock per day. Saturday last many of our people visited the mine to witness the operation of the mill, and all came away impressed with the idea that the mill will be a success. Free gold was seen upon the apron in abundance, and it is generally believed that the rock will pay from \$40 to \$50 per ton. That the mine is a good one there can be no doubt, but whether it can be made to pay with such a mill is a question. If the mine shall meet expectations it will not be long before a 40-stamp mill will be in full blast. At present the owners are working slow. Slow and sure is their motto, and they are right. To-day there will probably be a general cleanup and it will decide whether our hopes are to be realized or blasted.

**THE HORSESHOE MINE.**—*Grass Valley Union*, Sept. 11: During the last few days some good developments have been made in the Horseshoe mine, and the owners feel very much encouraged with the present appearances of the mine. Last winter the shaft filled with water, causing the pump to be lost and doing considerable damage. Besides, lately the mine has been freed from water, improvements made in the machinery and everything is looking favorable. The ledge is two feet wide in the bottom of the shaft, and shows well in free gold and heavy sulphurets. Some of the quartz has a pink tinge, and miners say that at the present depth, 165 feet, the rock resembles that taken from the Centennial mine some years ago, and which was rich. There is no doubt but the Horseshoe will prove to be a good paying property.

**CONTEMPLATED MILL.**—*Foothill Tidings*, Sept. 13: Mr. B. Pitchford, of the Risdon Iron Works, is in town looking into the matter of building a mill for the North Star Company. Should the company conclude to build immediately, they will construct a 30-stamp quartz mill. The mill will be run by water power, the water to be taken from the Empire. This will require 11,000 feet of pipe, and the pipe will be 22 inches in diameter. It is expected that the contract for building the mill will be let soon and that it will require 120 days to complete the contract.

## Placer.

**OPHIR ITEMS.**—*Placer Argus*, Sept. 9: Now that the ranchers are ceasing to draw upon the Ditch company for water, the quartz mills are starting up. The New Year company's mill resumed operations Saturday. It is a five-stamp mill, and is engaged in working custom rock. Mr. Dodge is superintendent. He represents San Jose capitalists. Pelster & Lavallee's mills are also crushing custom rock. Some three or four hundred tons of rock await crushing, after which the honest Ophir miners will not be so hard up as they have been. Jim Butts will start up his mine—commonly known as the Hathaway Ledge—soon. He is preparing to run an open tunnel into it. Everything looks favorable at the Doig mine. It is generally estimated that \$75,000 or \$20,000 have been taken out of it during the past six weeks.

## Plumas.

**STRUCK IT RICH.**—*Plumas National*, Sept. 9: Jeff Buffington has been running a tunnel for a long time to strike the upper channel at Cariboo. A short time ago he struck gravel, and last week he cleaned up 74 ounces as the result of six days' run with one pick. Jeff is a hard-working, deserving miner.

## Shasta.

**IMPORTANT MINING TRANSACTIONS.**—*Red Bluff Sentinel*, Sept. 11: For several days past we have known that the Cumberland Gold Mining Company was negotiating a sale of a portion of the Bully Choo group, and to-day we are in receipt of the facts. The company is composed of Senator C. F. Foster, Capt. J. D. Potts, of Red Bluff, J. Q. Finch, of Bully Choo, and ex-supervisor F. D. Robinson, of Shasta county. The three latter gentlemen have sold their interest in the Cumberland, Eureka, True Augur, Mammoth, Susie Foster and Triangle to George N. Cornwall of Napa. Mr. Foster retaining his interest in those mines. The interests in those mines were sold for a good round figure, but only a portion of the purchase-money was paid down. The necessary papers have been signed and filed for recording. Messrs. Robinson, Finch, Potts & Foster still own the Daisy, Home and Cold Spring mines, adjacent to the Cumberland and Mammoth group—spurs, in fact, of the mother lode. It is the intention of Cornwall & Foster to open their mines, and to do so they will spend from \$50,000 to \$70,000. Bully Choo is bound to be one of the best mining districts in the State.

## Sierra.

**CLEANUP.**—*Mountain Messenger*, Sept. 11: The Young America mine cleanup for the month of August was near \$34,000. The Cleveland cleanup was very good, but we did not get the figures.

**ST. LOUIS.**—The miners have done well hereabouts this season. D. Conlan has made a few thousand dollars in his claim.

**PORT WINE.**—The yield of the mines has been good this year. The Bunker Hill tunnel is in 270

feet, and the rock is now rather hard. Eight men are employed by I. Copeland in his mine at Wahoo. Jack Lloyd is running a tunnel just below Port Wine, near the old one, to front ground that may pay well.

**SALINAS & MERCER MINE.**—*Sierra Tribune*, Sept. 11: Messrs. Mooney, Stevenson, Hutchinson & Co. are about to let a contract to run 150 feet of tunnel on their ledge at the Salinas & Mercer mine. They expect to erect a 10-stamp mill as soon as the contract is finished, and to vigorously prosecute operations.

**BUNKER HILL.**—At Bunker Hill mine, Poker Flat, the tunnel is being raised on an incline of about 150 feet. Negotiations are now pending for an immediate sale of this property. The prospective purchaser is a resident of Virginia City, Nevada.

**GIBRALTAR MINE.**—Work has again been resumed at the Gibraltar mine, Poker Flat. The tunnel has been run about 300 feet. The prospects at this mine are apparently very good.

**GOLDEN MONARCH MINE.**—*Sierra Tribune*, Sept. 10: The Golden Monarch mine, of which Mr. J. W. Kane is the principal owner, has been bonded to Wm. Letts Oliver and Frank Harland, of San Francisco, for \$85,000, payable in three months. Mr. Harland recently made an examination of the mine, and was highly pleased with the results thereof. The mine lies between three Young America veins.

**GLIDDEN & STEWART'S CLAIM.**—The claim of Messrs. Glidden & Stewart, at Hog canyon, has a promising outlook. A pound of quartz taken from this ledge was pounded up and produced \$5 worth of gold.

## Trinity.

**NEW RIVER.**—*Cor. Yreka Union*, Sept. 11: The mining outlook of this section is extremely favorable. There are several mines working steadily upon a paying basis. The Grover Cleveland has recently made a good strike and the owners are correspondingly jubilant. The Hard Tack, Tough Nut and the Mountain Boomer have all been working good rock steadily. The Uncle Sam also has a good prospect. The Ridgeway has, under the superintendence of Mr. Dean, become a valuable piece of property. A Kendall mill has recently been put up on this property and is now in operation. A new patent one-stamp mill has also been connected with the water-wheel of the Hard Tack arastra by Messrs. Roe & Olmstead, they claiming a crushing capacity of five to seven tons per diem. The last crushing of this mine yielded \$40, but they now have richer rock. The Mountain Boomer just cleaned up \$1500, giving \$50 per ton, surface rock. The Tough Nut is crushing rock from \$100 to \$120 per ton. Mr. Haley has erected a Kendall mill, one stamp, near White Rock, and will shortly start crushing Modoc quartz. There are about 75 men in the camp, all working, and no idle men; wages \$3 a day without board. From New River I went to Yocumville. The Know Nothing Creek mines in that vicinity are also reported favorably. Loftus & Morris are working eight men in their claim, five miles up the creek from south fork of Salmon. The ledge varies considerably in width. They will start their arastra shortly on another batch of rock. That already crushed has averaged \$80 a ton. Rattlerfinger & Funk have four locations on Know Nothing creek, the principal ledge being two miles above the Loftus & Morris claim, on the same divide. They are building a new arastra and will be crushing in about two weeks. M. J. Isaacs packed last week 13 tons of rock from the ledge to the arastra, which, it is thought, will yield from \$700 to \$125 per ton. There is also a report of a new strike at Black Bear.

## Yuba.

**QUARTZ.**—*North San Juan Times*, Sept. 11: Frank N. Morris and George N. L. Powell have located a very rich quartz mine at the junction of the Middle and North Yuba rivers, in Yuba county. We have seen some of the rock which shows free gold and is rich in sulphurets. The locators are of the opinion that the lode is an extensive one, and that when properly opened the rock will be found to be very rich. The owners are now prospecting their claim for the purpose of testing the rock on a level of 50 feet.

## NEVADA.

## Washoe District.

**BEST AND BELCHER.**—*Enterprise*, Sept. 11: West crosscut No. 1, on the 600 level, was extended 30 feet during the week, making a total length of 253 feet. The face of the drift is thought to be in the west country rock, therefore not much further progress in that direction is liable to be made. Crosscut No. 1 east, on this same level, has been advanced 34 feet, making a total distance of 202 feet. Material, same as heretofore—vein porphyry with streaks of quartz. The heavy stone bulkhead on the 2500 level, to the north of the Osbiston shaft, being completed and the cement sufficiently hardened, the water-gate was finally closed on Wednesday, completely and effectually shutting out the heavy flow of water from the northward. The pumps in the shaft do not now have half as much water to handle as heretofore. This effectual boycott on the incoming water will materially assist in the proposed sinking of the shaft deeper.

**CHOLLAR.**—Owing to further trouble with the pumping arrangements at the Combination shaft, no progress has been made either in extending the lateral drift south on the 3200 level or in the drilling on the 3100 level. The repairs were completed, the water all out again, and work resumed on the 3200 level yesterday morning, drifting southward. The trouble was with the upper section of the Cornish pump-rod, much of which had been in use for the last ten years; therefore it has become liable to fracturing or weakening. Most of it is now renewed and no further trouble apprehended.

**HALE AND NORCROSS.**—Owing to the continued difficulty with the pumping arrangements at the Combination shaft, little or no progress has been made with the exploration developments on the 3200 level. Yesterday, however, everything being all right again and the water all out, work was resumed on the 3200 level, cleaning out and preparing to go ahead toward the Savage line, which is over 200 feet distant.

**SAVAGE.**—The development of the good ore body on the 600 level is going ahead as usual, and about

1000 tons per day of ore is being shipped to mill, in order to free the dump for further extraction from this level. On the 800 level the south lateral drift is being pushed ahead to intersect the ore body of the 600, in case it extends downward sufficiently. The face of the drift is in fine-looking vein material.

**CON. CALIFORNIA AND VIRGINIA.**—About 150 tons of ore per day continues to come from the lowest levels. This is of better grade than heretofore worked, averaging, according to battery assays, over \$20 to the ton. The exploration and development work on the 1400, 1500, 1600 and 1650 levels make the usual good progress, with no new features of interest to relate.

**ALTA.**—The main lateral drift south on the 700 level, following the east side of the old Keystone vein, is now in Alta ground. The northeast drift on this same level in Lady Washington ground is also making good progress, and will soon be into the ore deposit known to exist at that point. No crosscutting as yet at any point on this level.

**CROWN POINT AND BELCHER.**—During the past two or three days a few miners have been put to work easing timbers, repairing, etc., preparatory to resuming the extraction of ore at the earliest opportunity, the increase of water in Carson river inducing the hope that some of the suspended mill stamps will be enabled to run.

**GOULD AND CURRY.**—The upraise above north lateral drift No. 1, on the 450 level, was extended 13 feet during the week, making a total height of 55 feet. A crosscut east has been started from it, which is in 16 feet. Face in vein matter with streaks of quartz.

**OPHIR.**—The southwest drift on the 1465 level has entered Con. Virginia ground, running in favorable vein material. On the 1300 level the south lateral drift is in 381 feet. Material, vein porphyry with some quartz and clay.

**SIERRA NEVADA.**—Crosscut No. 3 west on the 520 level from near the face of the north lateral drift was advanced 37 feet during the week, making a total length of 116 feet. Material, same as last week—vein porphyry with a little quartz.

**POTOSI.**—Drilling operations on the 3100 level had to be suspended during the week by reason of the pumping trouble at the Combination shaft, but now they will be proceeded with as before.

**MONTE CRISTO.**—The face of the main west drift from the new shaft on the 150 level is thought to be near the main ore vein.

**MEXICAN AND UNION.**—The drifts and crosscuts north and west on the 700 level are exploring a promising section of ground.

**YELLOW JACKET.**—About 100 tons continues to be the daily yield, supplying the Brunswick mill.

**KENTUCK.**—Daily yield, 40 tons from the old ore sections above the 800 level.

## Arabia District.

**MONTEZUMA MINE LEASED.**—*Virginia Enterprise*, Sept. 11: The famous old Montezuma mine, in Humboldt county, which for several years has been unproductive and lost sight of, has recently been leased and bonded to James Leet and J. Jones, of Reno, for the period of six months. This mine is situated in Arabia district, and the probabilities are that it will prove a valuable purchase.

## Aurora District.

**SILVER LINING.**—*Walker Lake Bulletin*, Sept. 8: Work has been started on the Silver Lining mine under the superintendency of Capt. John Grey. A tunnel is being run near the Silver Hill mill, by which the ore can reach the mill cheaply. Rapid progress is being made in the tunnel, which will strike the lode at a considerable depth from the surface. Ex-Governor Blasdel remained here some days last week, and put some men to work upon his mine, Ophir Consolidated. The Governor is also interested in a mine at Pine Grove, to which place he went on the 3d inst. The "85" mine employs quite a number of miners; the ore is still being hauled to the Miners Mill. The mill of the Esmeralda Con. is stopped for repairs. Work is still progressing in the mines of the company. The ledge in the Antelope is expected to be cut in a few days.

## Mineral Hill District.

**RESUMED OPERATIONS.**—*Cor. Eureka Sentinel*, Sept. 14: After having been closed down for about a month the mill at this place resumed operations again on Monday, and it is thought no further depreciation will perhaps continue running the balance of the year. During the period in which the mill was closed a series of vats or leaching tubs were put in place, and experimental tests will shortly be made to prove whether a higher percentage of silver can be saved than was formerly done by the pan system.

## Mt. Cory District.

**TO BE WORKED AGAIN.**—*Virginia Chronicle*, Sept. 11: It seems to be a settled fact that work will be resumed at the Mount Cory mine, in Esmeralda county. A few years ago it attracted considerable attention, and was looked upon by experienced miners as a very promising property. Even John W. Mackay said it was a good thing, and backed up his faith by putting considerable money into the work of opening it up. Alex. McKenzie, of the Sierra Nevada, was sent over as superintendent, and died there, which seemed to give a black eye to everything connected with it. An immense mill, adapted to a tedious leaching process, was built, and many big bars of bullion were produced. Things went on swimmingly for a time, and all was serene at Coryville, which assumed the proportions of a sprightly mining camp. Buildings were removed from Bodie to Aurora, and the little place soon became the objective point of the regular crowd of shiftless adventurers who swarm toward "new diggings." But a change came. The ore didn't hold out, bullion shipments stopped and the leading mines of the camp shut down, much to the discomfiture and pecuniary embarrassment of a large number of persons who located there in full faith that a big bonanza was assured. The owners of the Mount Cory, however, never lost faith. For some months past the owners have had a small force of men working the mine, and the outlook induces them to resume operations in a comprehensive manner. This morning R. M. Ballard, superintendent, with Daniel McSherry and Nick Freeman, left for Hawthorne, and will go to work on

the Cory in real earnest. A shaft will be sunk and the ground thoroughly prospected to a depth sufficient to prove the value of the mine. The owners have abundant means to carry on the work, and will not succumb to any frivolous obstacle.

#### Osceola District.

**MILL-RUNNING.**—White Pine News, Sept. 11: An occasional correspondent writes us the following encouraging items from Osceola: Our five-stamp mill is running day and night. Jack Gilmer is bound to make it run if any one can. He says he has got the largest and best mine in the State in the Golden Eagle, and to judge from the amount and quality of quartz in sight, I think he has. The hydraulic company is cleaning up. If they had sufficient water to run for six months a year they would have a handsome dividend-paying property. Capt. D. B. Aikie and Delamater have made a run of 24 tons of quartz from a new discovery, which yielded \$40 in gold per ton.

#### Palmetto District.

**THE PALMETTO MINE.**—Walker Lake Bulletin, Sept. 13: R. B. Catherwood, president of the company's operations near Palmetto, went north last Saturday on his way to San Francisco. He reports excellent prospects in that region, and was in good spirits over the promising condition of the mines. As there is a large proportion of gold in their ores, the price of silver has not caused a cessation of work; on the contrary, the appearance of the property is such as to justify a large increase of force and a general extension of work.

#### Pioche District.

**BAD MINE TO WORK IN.**—Pioche Record, Sept. 7: The last lot of ore shipped by the chloriders working in the Mendha, we learn from Charley Niles, is the best ore that has yet been shipped by them. It goes about 78 ounces in silver and about 50 per cent lead. The men did not do more than one month's steady work in extracting ore, and it is calculated that they will make about \$250 each. All men who have chlorided in this mine have done well and made big wages. There is one great fault with the mine. Men cannot work in it any length of time without becoming leaded and forced to quit work. When the Day Company was working the mine, it was a veritable bonanza to the doctor and drug store, for about one-third of the men were always laying off with a dose of lead in them. Two mines such as the Mendha, in full operation, will convert a physician and proprietor of a drug store into a bloated bondholder in less than six months. It is not any wonder men, notwithstanding that they are broke, and the big inducements in the shape of big pay offered by the mine, reluctantly go to work there to get only a small stake to prospect on.

**LEACHING PLANT.**—Work of building a leaching plant on the east side of the Meadow Valley street divide has been started by the Pioche Con. Company. The intention at present is to build the plant immediately. The screenings, of which it is claimed there are vast quantities in the mines of the company, will average \$20, and will be hauled along the railroad track to the leaching works. The supply of water for leaching purposes is to be obtained from the Raymond & Ely mine, when the pump gets working. The water will be piped along the railroad to the works.

#### Union District.

**ORE.**—Cor. Eureka Sentinel, Sept. 14: It is said some 600 sacks of ore, or about 30 tons, will soon be forwarded from the mines of Union district to the smelters of Utah for reduction. This will be sent to prove the working value of the ore, and ascertain whether the lead ores of that locality will prove remunerative at the prevailing low price of silver.

#### Wild Rose District.

**ORE AND CONCENTRATIONS.**—Silver State, Sept. 11: Yesterday one of the Paradise Valley Company's trains arrived from the mill with 23,100 pounds of concentrations, and one of Charles Kemler's trains arrived from the mine with 18,800 pounds of ore.

**PARADISE VALLEY REPORT.**—For week ending Sept. 7th, milling ore produced 114 tons, 1000 pounds; shipping ore 26 tons, 1820 pounds. Total, 140 tons, 2820 pounds. Average assay value, per ton 92.97 oz. silver; 0.55 oz. gold. Shipped to Boston & Colorado S. Co., Argo, Colorado, 400 sacks concentrations, 36,020 pounds, par value \$282.67; 195 sacks shipping ore, 24,510 pounds, estimated par value, \$2451. Total, \$11,733.67. Mill run 167 hours; worked 124 tons; number of men on pay roll, 134. The mine is producing the usual amount of ore, and of a little higher grade than for some time past. Mill running steadily and water increasing some, which gives encouragement that we may soon have sufficient to run without using the engine.

#### ARIZONA.

**NEW DEVELOPMENTS.**—Mohave Miner, Sept. 7: Few people are aware of the amount of work that has been done on this mine in the past few months, and still fewer are aware of the fact that it has now become one of the leading ore producers of the county. Situated about a mile and a half from Stockton Hill, the C. O. D. is one of the oldest and best known of the mines in that vicinity, as it has been worked for a number of years past. Through the courtesy of Mr. Michael Daley, the efficient foreman of the mine, we were enabled to visit the underground workings last Wednesday. At the 200-foot level drifts are now being run on the vein both east and west. The east drift has been run in some 40 feet and shows 2½ feet of ore that will assay from \$150 to \$175 per ton. In the west drift, which has been run in about 30 feet, the ore body widens out from 2½ feet at the shaft to 6 feet at the face, the ore averaging from \$160 to \$200. These are actual measurements made by Mr. Daley with a two-foot rule in our presence, and may be relied on as being entirely correct. From this level we ascended the shaft to the 150-foot level, on which a drift has been run 145 feet westward, showing from 1 foot to 20 inches of ore which will average about \$70; and eastward about 90 feet with about the same amount of ore, which runs in the neighborhood of \$150. The work in the stopes above the 200-foot level has been discontinued on account of bad air,

consequent upon the damp atmosphere caused by the recent heavy rains. At the present writing, some 14 men are working in the mine in eight-hour shifts, and in spite of the inconvenience and trouble caused by the large quantity of water in the mine the ore shipments average from 40 to 50 tons per month. The ore is packed about a mile and a quarter to the road and from thence hauled to the Kingman Sampling Works.

**HASSAYAMPA.**—Prescott Courier, Sept. 10: Messrs. Wickler, Snapp & White, of Hassayampa district, are developing two good mines, the White Spar and the White Star. The latter is 12 feet wide and assays \$130 per ton in silver and \$50 in gold. They make regular shipments of ore from both mines. Specimens of silver ore from Smithline's mine and from that of Barney Williams in Humboldt district are the richest ever seen by us. Williams is going to ship 20 tons. The Tip Top mill in the same district is ready to run and will, it is predicted, be successful. Groom creek district will soon be the scene of active milling and mining. Its ledges are pretty rich in gold and silver. Another shipment of silver from the Peck mill is expected here in a day or two. As Mr. Bullock, general manager of our railroad, has assured us that reduction works will be erected and run in Prescott shortly after the completion of the road, there is little doubt that the coming winter and spring will witness a step forward all along our great mineral belt—the largest in Arizona.

**NOGALES.**—News, Sept. 9: Times are beginning to improve in this locality. Business is improving every day; more mines are being worked in this section; lots of chloriders are buying outfits and going to the hills in search of the precious metals, and altogether the future looks bright and inviting, and we venture to say that before another year this locality will be in a more prosperous condition than ever before.

#### DAKOTA.

**A STRIKE.**—Dakota Tribune, Sept. 9: A rich strike is reported from the Wall Street mine on Two Butte. Some rich ore is being taken out of the big Homestake cut. Minna has levied an assessment of three mills per share. Four bricks were brought in from the Iron Hill yesterday, weighing, all told, 3504.55 ounces. A fine lot of ore was raised from the Minna yesterday, we were informed through Jeff Hildreth, who visited the mine yesterday. Several tons of first-class Buxton ore passed through the city last evening on its way to the Omaha reduction works. The Isadorah will ship in a week or 10 days. We have been told by what we consider a reliable man that the Minna Company have given up the idea of shipping their ore East for the present, but would sell it to the Daveys, who will smelt it in their furnace. This will, or should, save something to the company, as Col. Davey will no doubt pay the highest price for the ore. The general report on the street this afternoon was that 12 bricks were brought in from the Iron Hill to-day, and that they, together with the five which came in last Sunday, were stacked in the bank windows at Deadwood, and that everybody troubled with sore eyes came and looked at them—it's good for sore eyes, you know. If the Homestake cleanup was added to the pile it would almost cure the blind. There was a general good feeling over the numerous silver bars.

#### COLORADO.

**MINING NOTES.**—Leadville Herald-Democrat, Sept. 9: The Gould shaft on the Mansfield group on Printer Boy hill is down about 165 feet. The lessees of the Vining mine on Rock hill are working regularly, but with indifferent results. A deep shaft on the eastern portion of the Gilt Edge lode should disclose good ore in large quantity. Good ore will sooner or later be uncovered at the head of East Sixth, west of the Luzerne shaft. Since the resumption of work in the Breece iron mine the stock of the company has advanced considerably. No other securities are paying as large rates of interest as the Small Hopes and Adams Mining Co.'s stocks. The lessees of the Castle View mine seem to believe in still lower ore deposits, as they are increasing the depth of their shaft. The Crown Point mine is shipping a lot of carbonate ore to the Arkansas valley smelter, that runs about 80 ounces in silver to the ton. The Brooklyn shaft of the Adams Mining Co. is expected almost daily to encounter the lower ore zone and new mineral bodies. Mr. D. W. Brunton is expected to return in a few days, when work will probably be commenced on the New Minnie mine concentrating mill. The American Mining and Smelting Co. promises to find a great bonanza in the Imes lode on Iron hill, which it is working under a lease. Mr. C. G. Arnold has about completed the opening of the Stevens ditch, and in a few days will resume work on his placers in California gulch. It is to be hoped that the test run now being made on a lot of low-grade ore from the Small Hopes mine at the Chrysolite mill will prove satisfactory. The Big Chief mine on Carbonate hill is one of the few really promising mines in the Leadville district that has been permitted to lie idle for several years past. Developments on the recently-opened rich ore chute in the Lee Basin property show a continuance of good ore. The chute is now opened by two separate drifts. Now that the Amie lode has passed into new hands, it is interesting to see what the property will yield with a new manager and verified returns of ore sales. While the Omaha and Grant Smelting Co. is not purchasing any carbonate ore here, it receives three or four thousand tons of sulphide and iron ore every month. The Arkansas valley smelter will receive its new 250-horse power engine in a few days. When in position the establishment will have motive power sufficient for ten furnaces.

#### IDAHO.

**KETCHUM NOTES.**—Bulletin, Sept. 8: The Bayhorse smelter is now running at its fullest capacity. The Ontario concentrator was closed down Saturday and the men all given their time. Four men are still retained in the mine. Billy Elder and Lou Walker have finished up working over the dump of the Wellington mine, Galena, and cleaned up nearly 500 sacks of good ore. The ore was brought to Ketchum, and the last load came down yesterday. Shipments of ore received at the Ketchum Sampling Works are increasing here of late. Since Sunday, nine tons of Independence, ten King of the

West and six of Live Pine have been received. A new lot is to be received to-day. Sam Bergman came down from the Tyrolse mine, Germania Basin, yesterday. He has a large shipment of ore on the road from the mine to Ketchum. At present 12 men are employed in the mine, and plenty of ore in sight. The new concentrator at the Carrie Leonard mine, Smoky, is completed and now running to its full capacity. There is an immense quantity of good concentrating ore at the mine and it is being run through the mill as rapidly as possible. The concentrator has a capacity for 50 tons every 24 hours.

**FLORIDA MOUNTAIN MINES.**—We hear that fabulously rich ore has been found in the Empire State, and that men are now being put on the mine by Mr. Dewey to extract the same as fast as possible. Some of the ore, it is said, is held together with golden threads. The Seventy-nine has been leased to D. D. McDonald, who has a force of men at work on the lode extracting ore. The lode is large and easily worked, and would keep any mill in the camp running constantly if more men were placed in the mine. The ore is low grade and will mill from \$18 to \$30 per ton.

**FLINT MINES.**—This camp now presents a very lively appearance, at least 100 men being at work in and around the mines and plant. The saw mill is kept busy, the planks being used almost as fast as they come from the saw. We are credibly informed that a very rich chute of ore has been found in the Perseverance, but its extent is not yet known. The ore is high grade and the lode large. We are told that the Leviathan is showing a large ledge of good ore that will mill well. It is similar in character to the ore taken from the mine in years gone by, and from appearances will mill as well.

**ELMIRA.**—Idaho World, Sept. 10: Ed. W. Barry, assayer for the Elmira company, came down from Banner, Wednesday. The mill has shut down for two or three weeks, for repairs. The Banner mine is now producing more ore in a given time than ever before this year, and probably turning it out faster than at any previous time. Ed says just before he left, as much as 30 carloads of fine ore were taken out on one shift, and he heard that this was far surpassed the day before he left, but could not vouch for the correctness of the report. One of the cars holds 1500 pounds, the other 1800. The east end of the lower tunnel is in fine ore. The pay chute dips east, and, therefore, the tunnel from the lower level had to be run further east to reach the pay than in the levels above.

**WAR EAGLE MOUNTAIN MINES.**—Silver City Avalanche, Sept. 7: The Oro Fino still continues to yield good ore and considerable of it, which Mr. Regan, the owner, is piling in separate piles and sacking. We saw some prospected the other day that would mill at least \$500 per ton. The mine is now being placed in excellent condition for working. The Oro, owned by C. S. Peck, is still yielding very rich ore, a considerable quantity of which may be seen on the dump. The lode grows larger and richer as work progresses, and from present appearances will prove a genuine bonanza. The Empire's lessees are pushing the drift north rapidly, and from present appearances will soon be on a body of ore. We hear that the Stormy Hill's lessees have encountered a very rich chute of ore in the drift, surpassing anything of the kind struck on that side of the hill for a number of years. The lode is large and well defined and easily worked. Hicks, Edwards & Co. are sinking the old shaft on the Silver Cord lode and have found rich ore, not only in the bottom of the shaft, but in the lower drifts also, which extend about 100 feet each way from the shaft. The shaft is now over 400 feet deep, and has a hoisting work over it, and engine which has power enough to hoist 1000 feet. Work is still progressing on the Trook & Jennings, and ore filled with gold and silver is being daily extracted therefrom. St. Clair & Douglas have been working on the Ruth since early spring, and from present appearances will be amply rewarded for their labor. They found rich float which they traced to this lode, and are now running a drift on the same to cut the chimney from which the float came.

#### MONTANA.

**DILLON.**—Cor. Inter-Mountain, Sept. 8: Of our mines, there is not much to record in the way of shipments. The owners feel the stress of the depression of silver, and those who are not turning their attention to developing and getting their properties in better shape for the future are running their ore out upon the dump to await shipment at such a time, when the returns will yield them a greater percentage of profit than the market now affords. Of the latter may be mentioned in particular the Dexter, which employs ten men, and the Rena, which employs six. Mining properties, without exception, are reported as looking unusually well, while the wealth recently uncovered in the New Departure is sufficient to startle even imperturbable Judge Lawrence A. Brown, the owner, himself.

**A BIG ENTERPRISE.**—The ten days' test run of the new 20-stamp mill of the Dillon Mining Company was brought to a close Saturday, the 28th ult. Over 80 ounces of gold retort was brought down as a result. Some difficulty was experienced with the feeders, but it is expected to be remedied before the regular run shall be commenced. An estimate of the ore in sight places it as sufficient, without further development of the mine, to keep the stamps running for two years. The low-grade ore, which runs about \$10 per ton, was used during the trial run, while the better class will go about \$15.

**PLACER DISCOVERIES.**—The first of last week, Mr. J. J. Loughridge, of Grasshopper, came to town and reported the discovery of some new placer ground near the mill of the Dillon Mining Company, about ten miles north of Bannack. The find was struck in an old prospect hole, which, by being sunk a few feet, touched bedrock, the first pan yielding about 35 cents. Upon being developed, a pay streak of 25 feet in width was found, which it is estimated will produce from \$6 to \$8 per day to the man. As soon as the find became known, all the ground likely to contain color was staked off by eager hands.

**\$4000 IN GOLD.**—On the 16th of last month, Mr. C. L. Fyhrle, Dr. Lyman and Professor Milford, the latter representing a large English company, took a trip to Gibbonsville to look over the valuable properties in that camp. They returned on the 25th,

being very favorably impressed with the showing. They brought back \$4000 worth of gold bullion, which was shipped to the Helena assay office.

**A MINING SALE.**—The little town of Argenta is highly elated over her prospects for the future, especially so since they are assured of the investment of Butte capital in their midst, as represented by Professor Mueller for a Butte company. It is understood that he has purchased the furnace, site and mill formerly owned by Messrs. Tootle & Leach, that work will be immediately begun, and the fires started in the furnace for the reduction of their ores. The Ball smelter, after running out another carload of bullion, has been closed down for repairs for the past week, but is expected to resume work in a few days. Mr. Bevans reports the sale of his interest in the Lost Cloud group of mines to Joseph Harby, of Bannack, for the sum of \$6000. Boise Sam, the boss of the China gang working the Horse Prairie diggings, came to town to-day to settle his bills. His cleanup for the summer is \$2300.

#### OREGON.

**GRAVEL AND QUARTZ.**—Jacksonville Times, Sept. 11: Capt. Ankeny talks of resuming operations at the Blue Gravel hydraulic mines, on Galice creek, next season. The machinery which is still lacking for the quartz mill on Jackson creek will arrive by the next freight train. It is stated that L. D. Brown & Son's new five-stamp mill will be on the site of the Swinden ledge in a few days. J. N. Casteel has finished his present contract with the Jacksonville Milling and Mining Co., having run about 250 feet of tunnel. The main ledge has not been struck as yet, though several small veins of a promising character have been uncovered. The one which has been searched for is not far off, however. J. S. Howard, of Medford, surveyed the big tunnel this week and found that it was about 18 feet to the left of the shaft which it was intended to run under, and also a number of feet beyond. It is not definitely known what the company intend doing, but will likely commence work again before long.

#### UTAH.

**THE COTTONWOODS.**—Cor. Salt Lake Tribune, Sept. 9: Supt. L. E. Bamberger, of the Silver Mountain mine, Big Cottonwood district, was here yesterday for the purpose of hiring a few miners, and to transact other business. Supt. Bamberger told your correspondent that the Silver Mountain mine is looking well, and is much pleased with the bright prospects for the Big and Little Cottonwood districts. Messrs. Admire and Cohn were here a few days since en route for the Evergreen and New York mining claims in Big Cottonwood. It is the intention of the company to resume work on those claims. I take the pleasure of announcing the arrival here of the great geologist, Professor Vincent, president of the Flag Staff Mining Co., an English corporation. He was warmly received by his host of friends. The professor is in charge of many important mines in Asia, Africa and in our country, the property of English capitalists. He was born in Ohio, but he mostly resides in London, England. Professor Vincent told your correspondent that the English capitalists are anxiously watching the New Emma, and as soon as the miners strike a good body of ore in that mine there will be plenty of English capital invested here.

**PARK NOTES.**—Record, Sept. 11: Thursday, a ten horse-power engine for temporary use at the new hoisting works on the Morgan group arrived, and was put in place yesterday. The Daly mine received from Geo. M. Scott & Co., Salt Lake, on Thursday, 1000 feet of 10-inch galvanized No. 10 ventilating iron pipe. The apparatus is to be used on the 800-foot level, and cost 80 cents per foot. Wednesday was pay day of the Ontario and Daly companies, Thursday the Crescent paid off its employees, and yesterday the Anchor boys were made happy by receiving their earnings for the month. The new sleeping-house at the Daly mine, with accommodations for 150 men, is nearly completed. Last Sunday the Ontario mill was closed down for repairs. The main repairs were to the engine, by boring out the cylinder about three-sixteenths of an inch, and now it will run more smoothly. A large ventilator and heater were put in. Other needed improvements and repairs were made in many parts of the mill, and Friday morning steam was turned on again for another long and successful run.

**ORE AND BULLION SHIPMENTS.**—For the week just ended, the Crescent shipped 235,204 pounds of concentrates, and 80,000 pounds of first-class ore. During the week, the Mackintosh sampler received 341,400 pounds of Ontario ore, 89,160 pounds of Daly, 262,470 pounds of Sampson and 24,220 pounds of Apex ore; total, 717,250 pounds. Owing to the temporary shut-down at the mill, no Ontario bullion was shipped this week. Frank W. Smith, associate mining editor and traveling correspondent of the MINING AND SCIENTIFIC PRESS, San Francisco, spent a few days this week in this, the largest mining camp in Utah.

**QUEEN OF THE HILLS.**—Cor. Salt Lake Tribune, Sept. 11: This mine is now operated under lease by Kirby & Stewart. The mine was discovered in 1873; sold in 1875 for \$135,000 to the Chicago Silver Mining Company, who worked it two years and then reorganized under the title of the Flavilla Mining Company and worked it three or four years, then again reorganized under its present name. The mine has produced from the grass roots down, having turned out at one time in two years an average of 45 tons per day, or over 30,000 tons, averaging from 40 to 45 ounces silver and the same unit of lead. It is fine smelting ore. The mine is now worked by about 50 men, and shipments of ore are being made. It has a good steam hoist. The lowest working at present is down 1200 feet on the incline. The vein is about 18 inches of mixed ore and is improving, all the time getting larger and better. The mine has several breaks in its formation, and when these were encountered, the ore was lost but afterward found. The ore chute comes from the southwest and strikes east about 200 feet wide, and, for about 1000 feet on the run, averaged from four to ten feet. The present working incline is on an angle of 20 deg. for 1000 feet, then changes to about 60 degrees for 400 feet further. Some of the ore is being concentrated at the Honerine mill, and there is a large amount of concentrating ore in sight.

## THE JAMES QUARTZ MILL

Saves a Higher Percentage than any other machine.

Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the **WHOLE WEIGHT and FORCE OF BLOW ACTS ALTERNATELY ON EACH DIE.** In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**  
**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

WILLIAM H. TAYLOR, President.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

## THE RISDON IRON AND LOCOMOTIVE WORKS.

Location of Works: S. E. Corner Beale and Howard Streets, San Francisco, Cal.

### BUILDERS OF

**QUARTZ MILLS**—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.  
**AIR COMPRESSORS**—Rope Power Transmission.  
**HYDRAULIC PUMPING** and Hoisting Machinery.  
**WROUGHT-IRON WATER PIPE** a Specialty. **NOTE**—Have just completed order for 35 miles of 44-inch pipe of 1-inch iron for Spring Valley Water Works Company, San Francisco.  
**SAW-MILL MACHINERY** of all kinds.  
**STEAM ENGINES**—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.  
**SOLE MANUFACTURERS** for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.  
**MACBETH PATENT STEEL-RIM PULLEYS**—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

**REFRIGERATING MACHINERY** for Steamships, Breweries, and Cellars.  
**WILSON'S PATENT GAS-PRODUCER.**  
**STEAM BOILERS** of all descriptions.  
**SUGAR MACHINERY**—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

 Send for Circular and Price Lists.

## CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

### Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 (XX) is the Strongest Explosive Known.**  
**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 250 California Street - - San Francisco, Cal.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**  
 Of Different Strengths as Required.

**NOBEL'S EXPLOSIVE GELATINE**, which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE**, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**

**FOR RAILROADS AND LAND CLEARING.** Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**BANDMANN, NIELSEN & CO.,**

## Work of the Ingersoll Drill.

[By a Correspondent of the New York World.]

I paid a visit to the new aqueduct tunnel the other day, and, by special permission, was allowed to inspect the work at different points. I was not there, thank you, from any political motives. I doubtless have my faults, but meddling with politics is not one of them. My interest in this mighty work of modern engineering was simply that of any ordinarily intelligent citizen. What struck me with especial force was the rapidity and comparative ease with which rock-tunneling is done at the present day. Here, for example, is an enormous subterranean passage, which will be when completed 33 1/2 miles in length and will have a maximum water-flowing capacity of 320,000,000 gallons a day, and this great tunnel, which is reached through shafts varying from 50 to 380 feet in length, is being excavated for nearly its entire depth through solid rock. How could such a work have been even dreamed of in the days of the old-fashioned hand-drill? As well might a swarm of beetles or an army of ground moles attempt to nibble their way through the Egyptian pyramids as for any number of men, armed simply with hand-drills and hammers, to undertake the construction of a tunnel like this. What was required was the use of the most perfect and efficient power rock-drills, air-compressors, boilers, hoisting engines and pumps. At the inception of the work the contractors and engineers made a most thorough and exhaustive examination of the various appliances in the market, which resulted in equipping the greater portion of the tunnel with the celebrated Ingersoll Eclipse rock-drills and straight-line air-compressors, boilers, etc., manufactured by the Ingersoll Rock-drill Company, 10 Park place, New York city. At the present time there are more than 240 of these drills in use in this tunnel, run by compressed air, supplied from these compressors, located near the top of shafts.

Have you ever seen these drills work? They have always seemed to me like human machines. I have seen them high up on the peaks of the Rocky mountains, where the miners pin their faith to them as all-powerful aids in robbing the granite cliffs of their silver treasures, and I have seen them plunging their great steel points into rocks below the surface of turbulent streams. They always interest me. In the work at this great aqueduct tunnel the Ingersoll drills have been peculiarly effective, and, as usual, have outstripped all competitors. The following comparative table of average monthly progress for the four months ending Feb. 27, 1886, will prove to the satisfaction of all persons who know anything of rock-work the eminent superiority of the Ingersoll drill:

Best 10 headings using Ingersoll drills exclusively.	Best 10 headings using Rand drills exclusively.
1. 231 ft. 21 in.	158.5 ft.
2. 214 ft. 13 in.	150.5 ft.
3. 207 ft. 7 in.	147.5 ft.
4. 200 ft. 14 in.	146.5 ft.
5. 198 ft. 15 in.	136 ft.
6. 194 ft. 15 in.	129.2 ft.
7. 187 ft. 19 in.	104.8 ft.
8. 186 ft. 10 in.	104 ft.
9. 175 ft. 24 in.	101 ft.
10. 174 ft. 18 in.	98.3 ft.

Monthly average..... 196.7 ft. 127.6 ft.

The best single heading with Ingersoll drills exclusively (9 ft. 8 in.) averages..... 231 feet. The best single heading with Rand drills exclusively (21 ft. 8 in.) averages..... 158.5 feet.

Average monthly progress for four months on the entire line (in 45 headings worked continuously) 142.6 feet. To put the matter in a way which will be more readily appreciated by the public, I may state that with five of these Ingersoll machines a distance of 83 feet has been driven in one week and 255 feet in 22 days through the hardest kind of rock, the size of the excavation being 15 feet wide and 15 feet high. When the work was started, Ingersoll drills were adopted in 21 headings. They are now used in 42 headings out of 47 in actual progress to the Harlem river.

I know from personal observation that the Ingersoll machines are extensively used throughout the mines, quarries, and in all rock-work of magnitude on this continent, and have been extensively introduced in Europe, Australia and India. The rapidity of their work is surprising. One of these machines, requiring two men to operate it, equals the work done by 15 men drilling by hand. These machines are run in underground work, by compressed air, while on the surface the motor power for the same machines is steam. The company mentioned manufactures various sizes and styles of machines, adapted to all kinds of rock excavation, whether it be for drilling holes for blasting or cutting out stone to dimensions for building purposes, and an examination of these appliances will well repay all people engaged in rock-work. PARKE & LACY, No. 12 California St. and No. 21 Fremont St., represent the INGERSOLL ROCK DRILL CO. on the Pacific Coast and in the Australian colonies, and will mail to any given postoffice address the progress sheets and maps of the great New York aqueduct tunnel.

## Mining Share Market.

There is little of importance to be said concerning the mining share market, which continues to be uninteresting. Owing to the recent prevailing cooler weather and consequent decrease of evaporation, allowing the mountain springs to rise, the volume of water in the Carson river is said to have quite materially increased, so that some of the mill stamps, recently suspended from lack of water motive power, are again to be put to work. A few miners have, within the last few days, been put to work in the Crown Point and Belcher, repairing and fixing the timbering in good shape and opening out generally, preparatory to resumption of ore extraction to as good an extent as the milling facilities will allow.

Good work continues to be done in the Con. California and Virginia mine, with resultant good ore production, under the efficient management. The recently constructed bulkhead on the 2500 level of Best and Belcher has shut out all the water flowing from the northward, consequently the pumps in the Osbiston shaft have only half as much work to do as heretofore.

At a meeting of the Charleston Relief Committee, Tuesday, it was stated that it will take at least \$1,000,000 to put the necessary repairs to the houses of persons who are utterly unable to make their dwellings safe and habitable.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

MASTER PAINTERS' ASSOCIATION OF PACIFIC COAST, Sept. 10. Object, to promote a friendly feeling among members of the craft; to exchange ideas and experience; to discuss methods of doing work of different kinds; to discuss the merits and demerits of articles used in the trade; to adopt rules and regulations governing apprentices; to provide means for the prevention of abuses and impositions on the trade. The principal place of business is in San Francisco. No capital stock. Directors—all residing in San Francisco—B. L. Brandt, E. M. Gallagher, M. J. Donovan, H. B. Wagner, J. S. Mellor, J. A. Wiswell, P. N. Kress, T. Downing and J. F. Sullivan.

CONFIDENCE GAS AND OIL CO., Sept. 10. Object, to bore and prospect for oil, gas and petroleum, to lay pipes and operate pipe-lines for the transportation of the same and to construct buildings and tanks necessary for such purpose. Capital stock \$250,000 in 10,000 shares. Directors, Justin Gates, J. D. Bodwell, H. Dabbel, W. H. Davis and H. B. Mayhew.

INYO MARBLE CO., Sept. 11. Object, to quarry marble in Inyo Co. Cal., and prepare it for market. Capital stock \$1,000,000 in 100,000 shares. Directors, L. Luce, J. M. Keeler, H. B. Keesing, F. Hiller, Jr., J. P. Fraser and G. W. Luce.

NORTON TANNING CO., Sept. 11. Location, California. Capital stock, \$100,000. Directors, A. W. Norton, S. E. Holden, E. Manassee, R. T. and C. T. Field.

NORTH OCCIDENTAL G. & S. MIN. CO., Sept. 11. Location, Nevada. Directors, Mark Strouse, John Rapp, Albert Buhlert, P. S. Kimball and Fred Nichol. Capital stock, \$2,000,000 in 100,000 shares.

DRAKE AUTOMATIC RAILWAY SAFETY SWITCH CO., Sept. 15. Capital stock, 100,000,000 in 100,000 shares. Directors, Wm. Birch, J. W. Stewart, Henry A. Johnson, C. S. Drake and E. H. Shoemaker.

WASHINGTON M. CO., Sept. 12. Location, Washington, Nevada Co. Capital stock, \$250,000, in 100,000 shares. Directors, J. H. von Schroeder, J. A. Bauer, J. H. Culver, A. Tregido and G. Godfrey.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, Sept. 11, \$52,971; Navajo, 11, \$8648; Standard, 7, \$9855; Marget Ann, 7, \$8432; Moulton, 7, \$11,760; Lexington, 9, \$20,768; Hanauer, 5, \$5970; Queen of the Hills, 5, \$2680; Crescent, 5, \$6300; Germania, 5, \$5059; Alice, 7, \$11,242; Germania, 7, \$3711; Hanauer, 8, \$2520; Queen of the Hills, 8, \$4400; Hanauer, 8, \$4770; Stormont, 8, \$2580; Queen of the Hills, 7, \$2800; Germania, 8, \$3684; 9, \$3772; Hanauer, 10, \$2500; Crescent, 10, \$3400; Queen of the Hills, 10, \$1390; Germania, 11, \$5431; Hanauer, 11, \$5555; Queen of the Hills, 11, \$3345; Alice, 11, \$21,260; Hanauer, 12, \$6025; Germania, 12, \$1660; Paradise Valley, 7, \$11,733. The banks of Salt Lake City report the receipt for the week ending September 8th, inclusive, of \$126,750.15 in bullion and \$71,223.43 in ore; a total of \$197,973.58. The base metal and ore output for the week ending September 11th was: Thirty cars bullion, 724,766 pounds, three cars copper ore, 75,310 pounds; total, 33 cars, 800,076 pounds.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE MINING AND SCIENTIFIC PRESS of the 28th ult. devotes about three columns to the mining interests of Owyhee, and gives a very faithful representation in most respects of our mines and camps. Its correspondent, Mr. Frank W. Smith, took the whole country in at a glance, and while he has done us justice, has not overestimated the merits of our country. —Silver City (Idaho) Avalanche.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 7, 1886.

- 348,822.—MACHINE FOR COVERING WIRES, ETC.—J. C. Belk, Tombstone, A. T.  
348,716.—RECLINING CHAIR—Boggs & McLuhan, Albina, Oregon.  
348,667.—DINING TABLE—C. A. Grillwitzer, S. F.  
348,629.—UPRIGHT PIANOFORTE—F. Imhorst, S. F.  
348,678.—MAIL POUCH—L. B. Lathrop, Hollister, Cal.  
348,752.—SPICE-BOX—L. Lemos, S. F.  
348,693.—DISK HARROW—L. A. Richards, Grayson, Cal.  
348,791.—SAFETY HOOK—E. H. Smith, Rutherford, Cal.  
348,793.—CHURN—W. S. Smith, Salem, Oregon.  
348,700.—PETROLEUM BURNER—A. J. Stevens, Sacramento.  
348,598.—BORDER FOR FLOWER BEDS—G. W. Strickland, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## New York Metal Market.

Telegraphic advices dated Sept. 16th give the following New York prices:

- BORAX—6 1/2% @ 7 1/2%  
BAR SILVER—95 per oz.  
COPPER-LAKE—\$10.37 1/2 @ 10.50.  
IRON—No. 1, \$17 @ 18.00.  
LEAD—\$4.85 @ 4.95.  
QUICKSILVER—43 @ 43 1/2%  
The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Firm, spot closing 10.25c @ 10.40c. Transferable Notices (Lake) issued at 10.35; Transferable Notices (Chili Bars) issued at 1.39 1/2.  
LEAD—Dull at \$4.75 @ 4.90c spot; \$4.80 @ 4.82 1/2 futures. Transferable Notices issued at 4.75.  
TIN—Firm at \$21.80 @ 21.90. Transferable Notices issued at \$21.85.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$21.80 @ 22.25; Billiton Tin, \$21.90 @ 22.25; Banca Tin, \$22.05 @ 22.40; Baltimore Copper, \$9.25 @ 9.40; Orford Copper, \$9.25 @ 9.45; P. S. C. Copper, \$9.35 @ 9.65; Foreign Lead, \$4.80 @ 4.87 1/2; Foreign Spelter, \$4.70 @ 4.75.

MAKER'S PRICES—At tidewater. 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge, \$15.00 @ 16.00. Hudson River, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge \$15.00 @ 16.00. Southern, Grade No. 1, \$17.00 @ 18.50; No. 2, \$16.50 @ 17.50; Grey Forge \$15 @ 16.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
Geo. McDowell—Santa Clara Co.  
FRANK W. SMITH—Utah and Colorado.  
M. S. PRIME—Marin Co.  
W. J. TULLIS—Humboldt Co.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,  
252 Market Street, San Francisco.

## Books on Assaying.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.  
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

## Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

Dewey & Co.'s Scientific Press  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,  
Office, 104 & 106 Washington St., NEW YORK.  
OR PACIFIC IRON WORKS, SAN FRANCISCO.

JENKINS PATENT VALVES.  
Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN &amp; CO., San Francisco, Cal.

## Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & Co., Publishers,  
No. 252 Market St., S. F.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-curdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

HEALD'S BUSINESS COLLEGE,  
24 Post St. S. F.  
Send for Circular.

## LUBRICATION.

Our readers can procure of CHARLES J. WOODBURY Manufacturer of Oils, 123 California St., San Francisco, a fine Lard Engine Oil, unsurpassed by any other Oil for general use, and which will flow through any feeder at all temperatures. Also, Cylinder Oils, Refined Cylinder Tallow, Lubric Compound, Farm, Machine, and strictly pure Lard Oil. The Woodbury Oils are in use on the Central, Southern, and Northern Pacific Railways, and nearly every Railroad and Steamship line on the coast.

## ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Ama or county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,  
AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,

(signed) N. W. CROCKER, Supt.

## REGISTRATION

—FOR THE—

## General Election.

All electors desiring to vote at the General Election, to be held November 2, 1886, must be registered regardless of any previous registration.

Registration for the General Election to be held November 2, 1886, will commence at the office of the Registrar of Voters, in the basement of New City Hall, on WEDNESDAY, August 4th, and will continue until MONDAY, October 11th, inclusive. Office hours, 9 o'clock A. M. to 5 P. M.

By order of the Board of Election Commissioners.

P. F. WALSH, Registrar.

August 1, 1886.

## WANTED!

Man of Capital and Mining Experience to buy a number of claims, all in the hands of prospectors. Three locations on same vein, 10-25 feet; formation, slate hanging, granite footwall; assays from \$10 to \$80 per ton in gold and silver, with a little copper in it. Can be opened and worked with tunnels to a depth from 400 to 2000 feet. Plenty of water and densely timbered. Title perfect. About 20 miles from N. P. R. R., Montana. No Reduction Works in the vicinity. Will bear close investigation. Great chance for practical mining men of some means. Price, \$30,000. For further particulars, address

J. W. LIND,

Marysville, Lewis &amp; Clarke Co., Montana.

## ASSESSMENT NOTICE.

Truckee Ice Company. — Location of principal place of business, San Francisco, California. Location of works, Martus Creek, near Truckee, Nevada county, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 1st day of September, 1886, an assessment (No. 1) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 202 Sansome Street, room 4, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 25th day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. W. SCOTT, Secretary.

OFFICE—No. 202 Sansome St., room 4, San Francisco, California.

## DIVIDEND NOTICE.

OFFICE OF THE

Paradise Valley Mining Company  
San Francisco, California.

At a meeting of the Board of Directors of the above-named Company, held August 24, 1886, Dividend No. 8, of Twenty-five (25) Cents per share, was declared payable on Wednesday, the 25th of August, 1886, at the office of the Company.

W. LETTS OLIVER, Secretary.

OFFICE—No. 328 Montgomery St., San Francisco, Cal.

## THE RUSSELL PROCESS COMP'Y.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY  
Room 709.

## San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS &amp; CO.

611 and 613 Front St., San Francisco.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

**WATER JACKET  
SMELTING  
FURNACES**

**THE DUNCAN  
CONCENTRATOR**

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

**BAKER'S MINING HORSE POWER.**

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## The Burnham Engines.

In a further examination of the different exhibits of the mechanical devices which are to be seen at the present exposition of the Mechanics' Institute, we note the simple and serviceable automatic, self-oiling steam engine built at Christiana, Pa., and for the sale of which, on this coast, the Joshua Hendy Machine Works, of Nos. 39 to 51 Fremont street, this city, are the agents.

We have been furnished by a representative of those works with a statement covering something of the history of the conception of this invention, and an examination of the cuts given herewith will afford an excellent idea of their form of construction and simplicity of operation.

These self-oiling automatic engines are the invention of an engineer who has devoted many years to devising plans for a fast-running, self-oiling, automatic engine, of simple and compact construction, to use steam economically, which could be run in the same room with other machinery without causing damage by steam.

The first engine of this form was run two months and thoroughly tested by all conceivable means as to its power, durability and steady running, and when taken apart for examination, all of its parts were found as perfect as when first put in operation. The second engine made was changed in appearance and placed in the Novelties Exhibition at Philadelphia, Pa., driving an Edison Dynamo, and run every day the exhibition was open (six weeks), from 10 A. M. to 10 P. M., and at the close of the exhibition was awarded the highest premium given to any exhibitor (silver medal and diploma).

These engines are self-oiling, not by cups with small adjustable tubes, which often clog and do not feed freely, but by wool or cotton, placed in large stationary cups, and saturated with oil, which oil is slowly conveyed to the running parts of the engine through loose wicks in tubes. The casing prevents the oil from getting outside, and deposits it, after being used, in the bottom of the casing, so that it can be used again, or removed, as may be desired. The ventilation at each end of the casing admits cold air to working parts of the engine, and the heat of the cylinder causes the air to ascend and pass out at the upper end of the ventilators.

The number of pieces constituting these engines is few compared with other automatic engines, and are so constructed that the fitting of each piece is done accurately by machinery to standard gauges. The crank-shaft and all other wrought material used, except connecting rod, are made of steel.

New tools are used with special appliances for fitting these engines to the best advantage, and the utmost care is taken to have every machine thoroughly made in all its parts. Each engine is tested before shipment.

The same firm also build double cylinder engines, having two cylinders and their connections in one casing, and which have double the power of the single cylinder. The two connecting-rods being connected to one shaft, having cranks at right angles, avoid dead-centers, and give the full pressure of the steam at all times to rotate the shaft, securing a much more steady motion than any engine with dead-centers. Double-cylinder engines taking steam only at one end of the cylinder have dead-

centers, the same as single-cylinder engines taking steam at each end of the cylinder. All dead-center engines must have heavy fly-wheel or other connections to retain motion over the dead-centers; and if not of very high speed the

any derangement of the one in use, can be made in a few minutes to the other cylinder without changing the machinery driven; or, if the full power of the two cylinders is used and a derangement occurs to one cylinder, it can be

Single Cylinder, Front Removed.

Single Cylinder, Complete.

BURNHAM SELF-OILING AUTOMATIC ENGINE.

motion is unsteady. Where a very steady motion is required the double engine is preferable to a dead-center engine. It is so constructed that in a few minutes either connecting-rod and eccentric-strap can be detached, and one cylinder used, giving the power of a single-cylinder engine of same diameter and stroke. There are many places where constant power is required, and by having this engine of double the power necessary, with one connecting-rod and eccentric-strap detached, a change, in case of

detached and one-half the machinery may be run while repairs are being made.

The engine now being exhibited, as above related, by the Joshua Hendy Machine Works, is rated at five-horse power, and its automatic simplicity of movement and elegance of design and construction are worthy of being seen, examined and studied.

GOLD has been found at Amesport Landing, Halfmoon bay, San Mateo county.

## California Marble.

We use in this State about half a million dollars worth of marble a year, most of it coming from Italy and Vermont, the latter being only about \$10 a ton cheaper than the former. The only place in this State where any steps have been taken to utilize the marble deposits on any scale is in Inyo county. A mill is now being erected there, some four carloads of machinery having gone down to Inyo last week. The mill will be erected at the quarry; steam-power will be used. There is already plenty of demand for the marble, and all possible effort will be made to hasten the completion of the mill, so as to get the marble in market as early a day as possible. When rail communication shall be established with the South, a great deal of the marble will go in that direction, some of it, doubtless, as far as New Orleans. There are now sufficient indications that this is destined to grow into a business of great importance. A company now owns these quarries, and they are going to work to thoroughly develop them. Blocks of any desirable size can be procured, free from stains. It can be supplied to manufacturers here at a cost not to exceed the freight on foreign marble. The dealers here do not take kindly to the Inyo marble, owing, mainly, in all probability to the present business interests in other marbles.

There are several marble deposits in California, but none have been worked to any extent. In Amador county, nine miles north of Ione, a good white marble is found suitable for building stone. Near Pence's ranch, Butte county, there is quite a large deposit. In Calaveras county there is found a pearl-gray marble with dark markings. At the Alabaster Lime Works, near Newcastle, Placer county, the marble varies from a pure white to an agreeable gray color, and takes a high polish. A beautiful mottled gray marble has been brought to the State Museum from near Eureka, Humboldt county. A yellow marble is found in Kern county, near Tehachapai. Both light and dark-colored marble have been found in Los Angeles county. Fine white marble is also found near Carmel bay, Monterey county. Several deposits were found near Auburn, Placer county. Extensive beds are known in Tuolumne county. No doubt, as marble comes more into use here, outside of its utilization for furniture trimmings, some of these quarries will be opened and worked. Meantime the result of the quarrying work in Inyo county will be looked to with interest.

THE case of the Excelsior Mining Co. vs. J. P. Pierce is on trial in this city. It is set forth in the complaint that the defendant was a director of the company, and as such voted for 19 dividends, which were declared between July, 1877, and August, 1878. The aggregate of these dividends was \$268,692, and it is alleged they were taken from the capital stock of the company and not from the surplus profits. The company therefore sues to recover this sum, with interest, which now makes it foot up \$450,000.

THE first ore bought for the new smelting works at Reno, Nev., came from the north end of Pyramid Lake, Cottonwood district.

SILVER PEAK, once a much-boomed mining district in Esmeralda county, is booming again. A new find of gold ore is the cause.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Centrifugal Pumps and Draining Machinery.

[Written for the Press by J. RICHARDS.]

NUMBER I.

## Centrifugal Pumps.

It is a common opinion in this country that centrifugal pumps were invented and first applied in Europe, and the art, to so call it, is one in which American engineers and mechanics have had but little part.

This opinion being inferentially, at least, promulgated by a recent article in the MINING PRESS, has prompted the writer to at this time carry out a long intended purpose of giving a true account of this important manufacture, and establish, as far as ascertainable facts will serve, the part that has been contributed from the United States.

It will, no doubt, be a matter of surprise to most of your readers to know that centrifugal pumps are strictly and entirely an American invention, and that 20 years before such pumps were made or known in Europe, they had in his country attained a form and efficiency but little inferior to the best practice of the present day, and in some respects superior to some pumps now made and sold.

This matter will, in a future chapter, be fully explained, and drawings given of American centrifugal pumps made between 1818 and 1830—long before any such manufacture was thought of in England, and much less in the Netherlands, where constructive art of the kind had been almost eliminated at the time.

The Gwynne pumps referred to in the article before named are of American origin. They were at first an attempted and doubtful improvement on American methods well known and extensively applied at the time; not only this—the first experiments of Mr. J. S. Gwynne, the senior brother, among those of the name now comprising the firm of Gwynne & Co., and J. and H. Gwynne, of London, Eng., were made in Pittsburgh, Pa., in 1844. The first pump made by Mr. Gwynne was for the Passaic copper mine, the location of which I am unable to ascertain. Mr. Gwynne's first patent was taken out in the United States from New York, where he then resided, and where he continued to reside for some years after the great contest and controversy at the London Exhibition of 1851, when such pumps were for the first time publicly exhibited in Europe.

The pumps shown there by Mr. Gwynne were called "Gwynne's American Pumps," and it was, no doubt, in some measure, due to this fact that the controversy arose between him, Easton and Amos, and the makers of the Bessemer Pump, as will be hereafter more fully explained.

I think the term "Gwynne's American Pump" was hardly correct, because Mr. Gwynne's alleged improvements, as before intimated, were of questionable value, as he will no doubt now admit; at least they form no part of his present practice; and as a matter that need not be one of opinion wholly, I will venture to claim that had the centrifugal pumps, as made in America previous to Mr. Gwynne's improvements, been put in competition at the exhibition of 1851, they would have given much better results than either of the three that were exhibited.

The drawings to be given hereafter will prove this, because, in the light of modern experience, the duty of a pump of this kind can be very fairly ascertained from its construction.

The experience of Mr. Gwynne in the United States, during a term of ten years or more, was in a sense the foundation of the manufacture that bears his and his brother's names. This manufacture, which is one of the greatest facts in the recent history of centrifugal pumps, was but a continuance of the art transplanted from America, and for a long time without substantial improvement except in workmanship and strength. It will not be too much to claim that after various experiments and modifications the practice settled down to very nearly what it was in his country in 1830. It went through a cycle of change and experiment which, as will be shown in another chapter, was alike unusual and discreditable to engineering skill, even of 40 years ago, and has not yet settled down into a regular engineering manufacture.

The comparatively limited use for pumps of the kind in the United States when no lands were drained, and when water-raising was seldom performed under circumstances requiring centrifugal pumps, permitted this manufacture to lag behind. It also fell into the hands of firms without engineering skill or without the skill required to develop it, as the firms of Gwynne & Co. and John & Henry Gwynne have done in England since 1855.

The works of Gwynne & Co. were at first on the water side, just west of the Temple, in London. The ground was acquired by the Commissioners for the Victoria Embankment, and the works were moved back to a position almost opposite the Temple station of the Metropolitan and District Railway.

The works of John & Henry Gwynne are at Hammersmith, eight or ten miles westward on

the Thames, and among the engineering manufactures of England it is to be questioned whether, on the grounds of careful workmanship, the selection of material or general good quality, there is any branch more carefully conducted.

The pumps, as before claimed, have gone through a maze of modification both in England and on the Continent. There has been as much retrogression as advance, and, except in the case of Messrs. Gwynne and some other firms that follow them, there is nothing beyond the American practice of 50 years ago.

Mr. Gwynne, in his patent of 1851 in the United States, begins his claims by saying, "I do not claim to be the inventor of centrifugal pumps," and after other negation to qualify his discoveries, confines his positive claims to certain mechanical details, which, as before remarked, have long ago disappeared in his own practice, and so far as I know never had place in any machines except those made soon after 1850. The pump for the Passaic copper mine was, we may infer, similar in construction to the one exhibited in London in 1851.

It was a disk pump 12 feet in diameter, with arrangement to protect the back of the disk from pressure, there being a single suction at one side. It was carefully engraved at the time, and can be examined in the patent and other references now available. It was called "Gwynne's Direct-acting, Balanced-pressure Centrifugal Pump," and called also, as before mentioned, "Gwynne's American Pump."

Messrs. Gwynne, Appold and Bessemer were exhibitors of rival pumps at the exhibition of 1851, and out of a controversy that arose then we are indebted for some history of American pumps that would otherwise no doubt be lost. Our meager records of that time, and a period of no record of inventions to speak of, from 1818 to 1847, has left us without history of early practice in this country; but, in order to combat some of the claims made by Mr. Bessemer (now Sir Henry), Mr. Gwynne and his friends were obliged to bring forward accounts and descriptions of the American pumps that formed the basis of Mr. Gwynne's practice. This, however unwillingly it were done, was unavoidable, because Mr. Bessemer had attached to his pump at the exhibition a placard bearing the following inscription:

"This model of a centrifugal pump for forcing fluids is made in rigid accordance with the specification of Mr. Bessemer's patent dated December 5, 1845, being the first recorded invention for impelling fluids by centrifugal force by a revolving disk."

This pretentious claim will appear a little ridiculous in the light of facts to be hereafter given, unless the word "recorded" is employed as a qualification; at any rate it gave offense to Messrs. Gwynne and Appold, and, as before remarked, caused a controversy between the commissioners and jurors of the exhibition as well as the exhibitors.

No doubt Mr. Bessemer had made an original invention so far as he was concerned, and discovered the employment of centrifugal force for "impelling fluids." He was, in fact, at the time engaged in making centrifugal drying machines for sugar, and in so far as all except the pumps he, at the time, had more to do, perhaps, with centrifugal force as an element in machine action than any engineer then living. His pumps as then made and subsequently improved and patented again in 1849, bear, in many respects, close analogy to centrifugal drying machines. One idea was born of the other, or, as might be said, one idea is almost the same as the other, and it would be quite unfair at this time to detract from the importance of Bessemer's invention, however much we may differ from the particular methods of application and use.

The adaptations shown in his elaborate patent of 1849 exhibit a fertility of experience and acquaintance with constructive mechanics that seems far to excel his knowledge of Hydrodynamics.

The controversy mentioned culminated in a challenge from Mr. Gwynne to operate the pumps in competition for a year, the losing competitor to pay £1000 into the treasury of the London Mechanics' Institution. This challenge was not accepted.

The peculiarities and characteristics of these different pumps will, as before mentioned, be explained in a future place. With this much in an introductory way, I will now proceed to note some of the facts in this history of centrifugal pumps, which can, no doubt, be confirmed by people now living—facts that should appear in the public records of our country.

The claim to original discovery on national grounds is in many cases silly and provincial, but in the present one is so marked and has been so ignored that its review will be a matter of common fairness.

## Notes on Lubrication.

## Report of an Actual Conversation.

Mr. A.: "Mr. B., we are alarmed at the second occurrence of fire in the vicinity of your oil warehouse, and have called to cancel our insurance with you."

Mr. B.: "All right; we will attend to the transfer of policy to another company to-day. But are you quite certain there is cause for alarm?"

Mr. A.: "Why, certainly; you have oil, and oil is the most inflammable of substances."

Mr. B.: "Yes, but there is oil and oil, you

know. Some oil is made to burn and some is made not to burn. You could insert a lighted torch into any barrel of oil in my warehouse and the torch would be extinguished as suddenly as if plunged into water."

Mr. A.: "Is that so? Why, your oils are petroleum, are they not? And how many fires we hear of every year caused by petroleum!"

Mr. C., entering: "Good morning, Mr. B. I want to know if it is safe for me to carry in stock at my iron works and silver mine any considerable quantity of petroleum lubricating oil. It's a great deal cheaper for me, but I don't want to run any risk."

Mr. B.: "Suppose you try to set a barrel of lubricating oil on fire, and see how difficult a job you have undertaken. Did you read the notice of the affair in Brooklyn, N. Y., a fire at a lubricating oil works, where, after the staves were burned through, the oil quenched the fire? I will insure you against any loss from this cause."

Mr. A.: "But how about so many oil fires—fires uncontrollable and destructive?"

Mr. B.: "They occur almost invariably at refineries. Crude oil is heated in stills over a furnace. Within three hours the air in the immediate vicinity is so laden with explosive vapors that a match or a cigar is not allowed on the ground. This process goes on until the naphtha, gasoline, benzine and all the heavier distillates intended for kerosene have been evaporated. The substance that remains in the still is exposed afterward to a process of destructive distillation, by which it is heated to 600 and 700 degrees Fahrenheit. Only after this does it come into the condition in which it is used for the production of lubricating oils. By this time you can readily see it is free from the obnoxious and inflammable elements that occasion trouble."

Mr. A.: "Can you tell us about the processes of making the refined oils for illuminating purposes?"

Mr. B.: "Oh, that is not a subject to make light of—some other time when there is more leisure."

CHARLES J. WOODBURY.

123 California St., S. F.

## Smelting Ores in Denver.

The tendency of trade to centralization is shown in the smelting business in this city. Denver smelters are now treating ore from Alaska, Old Mexico and Chili, in South America, as well as from all the States and Territories along the Rocky mountains. The trade with Chili in this line has but lately begun, but it is destined to be one of some importance. The method by which it was obtained is not without interest, and was as follows: Several months ago the Chilean Government appointed a commission of experts to visit the United States to examine the latest improved methods of smelting and ore treatment. They visited all the smelting centers of the country while performing their duties, and spent several days in Denver, where pains were taken to show them the methods used here. They were expert enough to understand that all the conditions in Chili were so much different from what they are here that there were economical reasons why American methods cannot be used there. The prices paid here for ore are so high that they find more profit in shipping and selling it here than they can obtain by treating it in Chili.

When Messrs. Eddy, James and Grant established their works in this city there was but one smelting plant here, and it was not always an easy thing to obtain the amount of ore it required. The establishment of the Grant works made this an important smelting point, and was followed by heavy shipments of ore, and the difficulty that had met the Argo works in obtaining a sufficient supply was no longer felt.

The establishment of the Holden smelter will have the effect of still further increasing the supply by drawing ore from sources which have not heretofore sent any to this market. The magnitude of the business here is little understood. One concern alone during the month of August treated 22,000 tons of ore and rock, and its receipts during the same month were 12,000 tons of ore, or 1000 car-loads.—*Denver Tribune-Republican*.

COAL-BURNERS ON THE HILL.—Two coal-burning engines have been put on the Sacramento division for the purpose of experimenting on the proposition as to whether they can be run through the long snow-sheds with safety to the traveling public. This course has been rendered necessary on account of the scarcity of wood this season. The immense freight and passenger traffic which resulted from cut rates last spring and the G. A. R. excursion this summer caused an extra consumption of fuel, and the railroad company finds itself short of wood at a time when they need a large quantity. There is said to be less than 20,000 cords on hand this side of the Summit. Be as economical as possible, this would not last through the winter. The annual consumption of wood by the C. P. R. R. is about 100,000 cords. A coal-burner now draws the local passenger train, and it is said that the run is being successfully made.—*Truckee Republican*.

It is stated that the engineer of Rapid City, Dakota Territory, in surveying for the water works, located the reservoir several feet above the fountain-head of the water supply, and now the water will not run into the tank, and, therefore, the city's \$50,000 water system is of no use.

## Oregon Gold Fields.

## The Baker County Mines.

A correspondent of the Portland News gives the following comprehensive sketch of the gold mines of Baker county, Oregon:

Baker county is bounded on the north by Union county, east by Idaho Territory, south by the State of Nevada, west by Grant county, Oregon, and embraces a country from 70 to 100 miles in width by 200 miles in length north and south; or, computed in acres, about 11,000,000, the greater portion of which has been surveyed and platted by the Government. The present population is variously estimated at from 15,000 to 18,000, and is rapidly increasing.

## Rivers and Creeks.

Streams of pure mountain water are numerous, and some of them are of such magnitude as to attain the dignity of rivers with volumes of water flowing through them equal to the Alleghany and other navigable rivers of the East, principal among which is the Snake, which rises in the Rocky mountains, in Wyoming, flows west and empties into the Columbia, of which it is the most important tributary. The next important rivers are the Malheur, Owyhee, Burnt and Powder.

The most important feature of Baker county is its gold mines, which embrace both placer and quartz, extending over a country fully 100 miles in length by 60 miles in width. The yield of the placers of Eastern Oregon in the early days of 1860-3 was fabulous, and fairly rivaled California in the exciting times of '49 and '50. Auburn, which was not like Goldsmith's lovely plain, but a lively, stirring gulch mining city of from 6000 to 7000 inhabitants, was the center of attractions and the center of placer mining in 1862-3, and produced its millions of nuggets and dust. The torn gulches, the ragged hillsides, the piles of displaced boulders and the diverted water-courses, mark the spot from which this great wealth was taken, and are monuments to the energy and enterprise of the men who pioneered and penetrated the wilds for gold and gain. Once so attractive, a more unattractive place than Auburn cannot be found in Oregon, with its tumble-down clap-board houses and log cabins. It is to-day what might be termed a deserted mining camp, the only occupants of the place being a few Chinamen who are engaged in mining, but with what success no one can tell, as their work is a sealed book to Melican man and outside barbarians. Giant and rooker, however, are kept busy by them, and there is no doubt but they have taken out large quantities of gold and will continue to do so for years to come.

## Quartz Mining.

While Baker county is rich in placers, it is still richer in quartz, and while much time and attention has been given to the working of several quartz ledges, the surface has only been scratched, and the free gold skimmed off, as it were, leaving the rebellious and richer ores on the lower levels to be extracted and worked by improved modern appliances and handled by skilled metallurgists. Hundreds of thousands have been extracted, but millions yet remain, and modern machinery is now being placed on the mines to do the work.

There are nine organized mining districts in Baker county, as follows: Pine Creek, Eagle, Sparta, Virtue, Gold Ridge, Burnt River, Connor Creek, Granite and Pochontas, with Baker City as the great distributing center. Last year there was a general stampede to the rich and newly-discovered leads of

## Pine Creek.

And the Whitman, Red Boy, Robert Emmet and Lucky Boy were frequently mentioned by the News. The town of Cornucopia has since sprung up as a lively mining camp, with many pretentious houses and numerous branches of business. Development has been prosecuted in the mines, ore shipments made to Omaha, and a vast store of sulphurets uncovered. Last Saturday a 10-stamp gold mill was shipped into the district from Baker City, and it is only a question of 60 days before the stamps will make merry music for the honest miners. Three arastras have been running for some time past on free gold croppings, and about 60 miners have been engaged in extracting ore and in development work on the several mines and prospects. A good wagon road, partially completed at the expense of the State, opens the way to the mines of Pine Creek. The future of the district is promising.

## Eagle Creek

Is an important district, containing the same class of ore, and has several mines in process of development. One arastra has been running with fair results.

## Sparta

Has a number of placers, and its quartz mines have been sufficiently developed to justify the erection of a quartz mill on the Dolly Varden, which is patented. There is plenty of water and timber for all practical purposes.

## Gold Ridge

Has a 10-stamp mill, and is shipping about \$8000 per week in the way of gold bricks to Baker City.

## Connor Creek

Is the home of the Connor Creek mine, which is known as the most productive gold mine in

Oregon, which has a record dating back several years second to none in the Northwest. The ore is free-milling, and the mine is permanent. The owners are Reed, Paull and Ainsworth, parties well known in Portland.

#### Pocahontas

Is eight miles from Baker City, and is a district containing the well-known Nelson placer mine, for which \$400,000 was offered and refused by Mr. Nelson, the owner, a son of Dr. Nelson, of Portland. The developments of the mine continue uninterrupted and the output is perfectly satisfactory to the fortunate owner.

#### Burnt River.

This district has become famous for its placers the world over, and has produced and is now producing a large amount of gold dust. Preparations are also being made to open up new ground and work it on a very extensive scale. In this district is located

#### The Cleveland Mine.

Which one of the few well-defined free-milling producing properties in the eastern part of Oregon. The owners propose incorporating it, and will set aside sufficient stock to put in a small mill and develop the mine systematically.

#### The Virtue

Is one of the best known mines in Baker county and has produced from the grass roots down. It was formerly the property of Mr. James Virtue, of Baker City, a man who is doing more to advertise the resources of Eastern Oregon than any person in it. The mine is now owned by San Francisco men who are putting in extensive machinery. It is distant from the city about eight miles.

#### Baker District

Is coming to the front as one of the most promising in the country. New life has been infused into it and active work is now going on, both placer and quartz. The district is situated about 40 miles west of Baker City, and five miles from the stage station kept by Mr. Parker. It embraces an extensive country with hills ribbed with rich gold quartz leads and gulches which have produced nuggets worth \$50 to \$3000. Here are the celebrated Parker & Winters diggings, which turned out hundreds of thousands and made the fortune of many a hardy miner. Mr. Travillan, ex-sheriff of Baker county and a gentleman well known in Eastern Oregon, is engaged, with several other good miners, in opening up the winter ditches and making preparations for extensive operations next spring.

#### The Nesbitt and Bonanza

Quartz mines, at the head of Ireland Gulch, and about a mile from the Winters' placers, have recently been purchased by Messrs. James Steel, of Portland, and Thomas Gilchrist, of Baker, and others. The Nesbitt has hitherto been worked with fair success with inferior machinery. The mine is opened by a tunnel and shafts, exposing ore the entire length. Enough is in sight to justify the building of a ten-stamp mill, which is now being built at the Willamette Iron Works, Portland, and will be put on the grounds under the supervision of Prof. Clayton. The outlook for this property is exceedingly promising, and as it is in the hands of first-class men, will be managed in a manner which will bring wealth to themselves and credit to the Parker district.

This district can be readily reached by way of the Baker and Canyon City stage line, owned by Messrs. Parker & McEwen. The line is in excellent condition, and as the roads are good (barring the dust), Sam Ross, the wide-awake driver, will put passengers through on time.

Every comfort is assured the traveler. Half-way house, Britton, kept by Mrs. Britton, and at the Parker house, kept by Mrs. Parker.

The road passes through one of the most beautiful and interesting portions of Oregon, and a trip over it is exceedingly delightful.

#### Prospecting.

Prospectors are daily passing through the Blue mountains, and many of them have succeeded in making lucky finds. The other day Mr. Britton, of Britton's station, struck it rich in the Rainbow, and has plenty of free-gold ore to show his friends. His neighbor, too, was equally fortunate in striking a mine which he called the Hurricane. Both are on the famous Mammoth lode, and are very promising prospects.

#### Baker City.

All roads lead to Rome, so do they all lead to Baker, and the result is a busy, bustling city, which is now commanding more attention than any place in Oregon outside of Portland. It already contains a population of 2500, with a prospect of doubling it in another year, and quadrupling it in four years. The center of a gold country without an equal in extent on the continent to-day, there is nothing to prevent it from becoming second only to Portland. The News, which circulates more extensively in Eastern Oregon than any other Portland daily paper, makes the prediction that Baker City will have 10,000 people four years hence. What Butte is to Montana, so will Baker be to Oregon; what Leadville is to Colorado, so will Baker be to the land of the Webfoot.

A YOUNG German chemist has kept blood uncoagulated for many days by coating the interior of its receptacle with oil.

### Gold Lake Mines.

#### A Promising Mining District.

Last Monday, says the *Sierra Tribune*, John Scott and Dr. Hutchins took a trip out to the new mines of Gold Lake district. The first mine they saw was that of Mr. Snow, located on the south side of the first hill south of the lake. The men are building a nice cabin, and say they may winter at the claim. They have a tunnel in about 40 feet, well timbered; also an incline down 25 feet. They have from one to two feet of good-looking quartz.

Going up the steep hill and around on the side that overlooks the lake, they came to the camp of the Forest King. Here Mr. Bowers, one of the owners, entertained the visitors royally with good, old-fashioned bacon and beans, bread, coffee, etc. Ample justice being done the dinner, they went to the mine. The lode is located on the north side of the great peak that stands sentinel over the southern end of the lovely lake, and runs directly through the mountain. This enables the owners to open the mine by a drift on the vein. The vein has been traced clear down to the bottom of the hill. A drift has been run 80 feet on the vein and shows from six inches to three feet of ore. This ore is just "away up;" it will pay at least \$100 a ton. A substantial log house is being built, and the owners expect to work all winter. The verdict was, "better than the Young America."

From the Forest King they went down the mountain and to the east about one mile to the Forest Queen. This is the old Rhodes mine that was worked over 20 years ago and abandoned. Here two men were at work cleaning out the old drift and retimbering. In the progress of the work a large amount of fine ore has been taken out. The visitors were shown lots of specimens showing free gold. Samples brought away, and since prospected, prove all the ore to be of very high grade. The men had just reached the head of the old incline, which, they think, is in good shape. There are four or five hundred tons of \$40 or \$50 ore about this mine. If indications are worth anything, this, too, will be a valuable property.

Let us notice one thing: None of these developments are the work of capital. A few men of very moderate means, some having only their ability to work hard and live hard, are doing this work. Talk about what capital has done for this State! Men of capital have not made this State the grand empire it is, but it is the men of hard hands, the men of faith and pluck and brawn. When the nut is cracked capital is always ready to steal the meat.

### Safety Catches on Incline Trucks.

A correspondent of the *Foothill Tidings* (Nevada county) says: There is a great want existing to-day among us as miners—not an individual, but a universal want; one which, as soon as sufficiently brought to the notice of the theoretical and practical mine owners and mine managers of Grass Valley, we believe will be removed. We want a catch placed on the trucks carrying men on our incline shafts; for, we are sorry to say, not one is used at the present time in any of the mines. Though mining here has been comparatively safe in the past, yet somewhere in the dim future this safety catch may be needed—the rope (notwithstanding all man's care) may break; and what a satisfaction it would be to the company to feel themselves prepared for such an emergency! And what a double satisfaction and zeal it would give the men to observe the interest taken in their lives! Why, it would be as great a boon as was ever conferred on the people of Grass Valley if this "catch" were adopted, and the names of the men conferring the same would be handed down from generation to generation as model men, whose example would be worthy of imitation by children's children. I would say this "catch" can be placed on the trucks very easily and cheaply, and will be one that would answer the demands made upon it in any emergency. If such an emergency should occur (which I hope never will) who will come forth and state the amount of good which would be accomplished? The worth of the lives saved, the amount of suffering prevented, desolation, misery and poverty averted? Would not the men, through whom all this calamity was prevented, stand up to the world as philanthropists of the first degree? as model men—men recognizing the claims of humanity and brotherly love upon them? Aye! their remembrance would be everlasting as the hills, and their names revered as things precious in history.

We as miners anxiously await the day when the mine managers of Grass Valley shall stand apart from their fellows and set an example before the gazing world by adopting this safety-catch.

At the recent annual meeting of the Homestake Mining Company, the receipts for the last fiscal year were reported at \$1,665,193; dividends, \$612,500; balance carried forward, \$314,718. Most of the ore was taken from the 300-foot level. The 400 and 500-foot levels were being opened with fair prospects. It was estimated that there was over 700,000 tons of ore in sight. All the machinery about the mine and mills was in good repair and working smoothly.

### A School on Wheels.

#### Instructing Trainmen About Air Brakes.

The Union Pacific Company, says the *Omaha Republican*, has just completed a very handsome car, in which is displayed most attractively an entire Westinghouse air-brake outfit, where trainmen, especially engineers, may be schooled and trained in the proper use of that valuable patent. The Burlington and St. Paul companies each have a car somewhat similar but not nearly so complete as this one, and no doubt all the big roads will ere long be supplied with something of the kind. It is bound to become a very valuable institution and result in a much more skillful and safer handling of trains than has ever been known to the railroad service. Quite recently the Union Pacific Company adopted Westinghouse air brakes, and has equipped all their freight cars with them; but by reason of a lack of knowledge on the part of trainmen in knowing how to operate the scheme correctly, annoyance and bad mistakes have been experienced. To remedy this and bring railroading up to scientific principles, the school car has become a necessity; therefore, with the enterprise that has marked its management of late years, the Union Pacific leads all competitors by being the first to fit out and arrange the most complete model ever invented. They took the old directors' car, No. 21, repaired it thoroughly for the purpose intended, and will be ready to send it over the road next week. T. A. Hedendahl, an experienced and expert engineer, will be in charge of the car as superintendent and direct the instructions. The arrangement from which the trainmen will take their lessons in the use of the air brake is very fine and comparatively simple. At the front end of the car stands a frame on which rests 30 air chambers and 1000 feet of pipe, just what would be required for an ordinary train of cars, and in addition there are also the wheels and gearing of a freight car, with the air-brake attachment mounted on another frame about the center of the car. In the opposite end is stationed a very attractive engine of about six-horse power capacity, while between this and the frames spoken of above is planted a steam chest on which are the gauges, valves and apparatus by which the engineer works the brakes. With the steam engine and pumps; main reservoir in which compressed air is stored; engineer's brake valve which regulates the flow of air from the reservoir into the brake pipe for releasing the brakes; main brake pipe, and auxiliary reservoir brake cylinder; triple valve which connects the brake pipe with the auxiliary reservoir and the latter to the brake cylinder; the car model completely equipped and the full complement for a complete train, you would imagine that the car is well filled, but such is not the case. The remaining space, which is nicely carpeted, gives ample room for 20 men at a time to watch the operations of the machinery and listen to Mr. Hedendahl's explanations and instructions. He stands at the main reservoir, and by working the engineer's brake-valve causes the air-chamber cylinders to move out and in, the same as when in use on cars that are on a track in a train and in motion. His instructions are minute as to detail, covering every point, supposing many things that might occur in case of accident, and at times Mr. Hedendahl grows quite eloquent. Take a case in point merely for illustration: A train of 30 freight cars heavily loaded, going down grade, breaks about the middle; of course the air-pipe is also broken, but brakes are drawn. The engineer increases speed to get away from the detached part of the train. By turning a lever the rear-end trainman keeps the brakes down, so that a collision like many that have occurred in accidents of this kind is easily avoided. Without that knowledge of the brake to be obtained in the school-car, trainmen are very often at a great loss to know what the matter is or how to remedy it should the brakes get out of order. The invention is certainly a great one, and will be very valuable to the Union Pacific road. Mr. Hedendahl goes first to Grand Island, where he will stop a few days, and then make every division station on the entire system.

WANT GOLD MINES.—Ex-Senator Wallace, of Pennsylvania, who owns mining property in Ouray county and is making a trip to this county to examine it, as well as to look after some gold properties in San Miguel county for an English syndicate, says that as a result of the prevailing low prices of silver all foreign investors are looking for gold mines, and will touch nothing else. He is of the opinion that any one owning a ledge of free-milling gold ore, whether low or high grade, can readily find a purchaser under existing circumstances, whereas only a short time ago people would not even go to look at a gold-bearing property unless phenomenally rich. He thinks there is occasion to be encouraged over the outlook for the mining industry, and believes it to be in better condition than for years past.—*Denver Republican*.

AT THE Mechnich Lead Works, in Germany, the tallest chimney in the world has recently been completed. It is 440 feet high, 6 feet more than the famous chimney of the St. Rollox Chemical Works, Glasgow, Scotland, which, until the German one was built, was without a rival. The flue of the Mechnich chimney is 11½ feet in diameter at the bottom and 10 feet at the top.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR BURNING PETROLEUM.—A. J. Stevens, Sacramento. No. 348,700. Dated Sept. 7, 1886. This invention relates to certain improvements for the burning of petroleum or hydro-carbon oils, and it is especially adapted to such combustion or connection with steam-boiler furnaces. The method is that which has been in use for some time on the ferry-steamers of the C. P. R. R., on this bay, and which we have before described.

DISK-HARROW.—Lovell A. Richards, Grayson, Stanislaus Co. No. 348,693. Dated Sept. 7, 1886. This is one of that class of harrows which are provided with oppositely-inclined disk-gangs, the inner ends of which have abutting bumpers; and the invention consists in the pivot connection of the tongue with the beams of the gangs, whereby on (gang is held to the tongue and the other is allowed to have a lateral movement. It consists, further, in the side braces, by which the disk-gangs are held and their inclination varied, and in said braces in connection with the tongue and the beams of the disk-gangs. The object is, while providing for the various adjustments of the disk-gangs to hold them at the same time in the same vertical plane at their meeting ends, so that said ends cannot get out of line by moving up or down.

DINING TABLE.—Chas. A. Grillwitzer, assignor to Automatic Dining Table Co., S. F. No. 348,667. Dated Sept. 7, 1886. This invention relates to that class of dining tables which may be called "self-helping," and it consists in a combination of devices. It is intended to provide a dining table at which the guests may be speedily and effectively served without the employment of waiters. A guest having been seated, punches out on the bill of fare the articles he wants. Then laying the bill of fare on the tray in front of him, he touches a button, which transmits a signal to the kitchen, giving also the location of the guest. By turning a drum in the kitchen, the carriage (a part of the table) is drawn back to the kitchen, where it is supplied with the order, and then returned to the guest in the proper place at the table.

MAIL POUCH.—L. B. Lathrop, Hollister. No. 348,678. Dated Sept. 7, 1886. The invention relates to certain improvements in mail pouches in which the patentee provides a more efficient and rapid system of unlocking and opening, and closing and fastening, the mouth of the pouch; a means for holding the direction-card holder, a means for suspending the pouch so as to be filled, and a means for making the pouch dust and water-proof. The invention consists of a flap extending beyond one side of the mouth of the pouch, so that it may be folded over upon the opposite side, and rigidly fixed staples projecting from this side and entering corresponding sockets in inclosing caps, which are secured to the flap, a sliding strap having pins secured to it, and a holding and locking device upon one end of the sliding strap by which all the pins are retained in their places when the pouch is closed; and the address or direction card also locked into place.

THE SUTRO TUNNEL.—The suit of McCalamont Brothers, London, to obtain the foreclosure of a mortgage held by them against the Sutro tunnel, for the sum of nearly \$1,000,000 loaned, with interest added, will be adjudicated at the next session of the United States Court at Carson. After the foreclosure of the mortgage the property will be sold by the United States Marshal. The *Virginia Chronicle* says that after the sale an effort will be made by the management of the Comstock ore-producing mines to have the royalty on low-grade ores reduced, or arrange a schedule of rates on different grades of ore, the royalty to be also graduated according to the cost of extracting it at great depths below the tunnel level. The sale of the tunnel property, after the foreclosure of the mortgages against it, will net U. S. Marshal Kelly a handsome sum, provided it brings \$1,500,000—the total amount of the mortgages with interest accrued. The Marshal is entitled to eight per cent of the sum for which the property is sold.

LEADVILLE is to-day the greatest retail market for steam pumps in the United States. More large Cameron, Knowles and other standard pumps are sold there every month than many persons have any conception of, and the same may also be said of steam hoisters.

OWING to the low price of silver, a number of mines in this county have been storing the ore which they are obliged to take out in developing, and it is noticeable that shipments have fallen off considerably in consequence of this fact.—*Georgetown Courier*.

BOYS AND GIRLS may be had, particularly boys, for service at wages, for indenture, or for legal adoption, by applying with recommendations to E. T. Duoley, Supt. Boys and Girls' Aid Society, Baker street, corner of Grove street, San Francisco.

## Passing Events.

The establishment of custom reduction and sampling works at Portland, Oregon, is an indication of an improvement in the quartz industry of that State. The great trouble with mining there has been the lack of just such facilities as these works will offer when opened next month.

The Mechanics' Fair closed in this city this week, and many of our manufacturers now receive their rewards in medals and diplomas.

Quicksilver again advances in price this week. This metal has been so low for such a term of years that numbers of mines have been closed and only the largest ones could keep at work. If it advances much above present rates, however, probably some of the smaller mines will start up. This metal is not mined in the United States outside of California.

Silver still holds to its recent advance, much to the delight of silver miners, who, however, would like to see it go up a few notches higher.

An explosion occurred in one of the detached sheds at the Giant Powder Company's works at Fleming's Point, on the bay shore, on Thursday morning, and two Chinamen were killed.

The superintendent of the assay office at Helena reports that Montana last year produced \$23,000,000 in precious metals, the amount of gold being \$5,000,000.

## Mineralogical Notes.

Argyrodite is a new silver ore, first found in September of last year in the Himmelfurst mine, near Freiberg. It has a metallic luster and steel-gray color. The hardness is 2.5, and specific gravity 6.085. It is opaque and brittle, occurring in crystals and compact masses. The minerals associated with argyrodite are: spathic iron ore, zinc blende, copper pyrites, iron pyrites, marcasite, argentite, pyrrargyrite, polybasite and stephanite. A number of analyses gave 75 per cent silver and 18 per cent of sulphur, and a loss of 7 per cent. This loss was found by C. Winkler, on February 1st, 1886, to be due to the presence of a new element, which he calls Germanium.

Toward the end of 1882, rich auriferous deposits were discovered in Queensland, 25 miles from Rockhampton, near the Dee river. The matrix is a ferruginous quartz, in which the gold is disseminated in a very finely divided state. The rock appears to have been deposited from a hot spring which held the quartz, iron and gold in solution, and from which the gold was precipitated. In the cavities opened out in the mine there hang stalactites of oxide of iron and quartz, containing finely disseminated gold. The gold is remarkable for its purity. It assays 99.7 per cent in gold, the rest being copper with a trace of iron.

A new metallic element, called anstrum, has been isolated from the arendal orthite. No description of the metal or its reactions has yet been given.

An aluminium alloy, obtained by melting 10 parts of tin with 100 parts of aluminium, is found to be more easily worked and is less affected by reagents, etc., than pure aluminium. Moreover, it can be soldered easily and without any special preparation. Its specific gravity is 2.85.

An analysis of four samples of coal collected by C. D. Walcott, in Deer Creek valley, 13 miles south of the San Carlos Indian Agency, Arizona, gave the following results:

	1	2	3	4
Water.....	1.59	0.48	3.27	0.56
Volatile hydrocarbons.....	15.79	19.81	12.51	17.50
Fixed carbon.....	49.72	61.01	5.72	62.85
Ash.....	32.90	78.50	78.50	21.09
	100.00	100.00	100.00	100.00

An excellent article on the preparation of titanium and aluminium, with a note on the separation of titanium and iron, has been published by F. A. Gooch in Bulletin No. 27 of the U. S. Geological Survey.

## Copper.

Copper miners are becoming more hopeful of the industry so long depressed. When even large mines, like some of those in Montana and Arizona, have to shut down, of course the smaller mines can have little chance of profit. None of those mines lately closed have started up, but the restriction of product has slightly improved the market. In the case of the Anaconda mine, which has been producing about 2000 tons per month for some time past, the English copper buyers believe that the recent closing down is done with a view to reduction of wages and railroad freight, and at the same time enhance the value of their large unsold stock of copper.

As England rules the copper market, some few facts relating to copper there will be of interest to miners here. The demand for English copper, both manufactured and unmanufactured, continues very limited, and several smelters and manufacturers are now working only about three days in the week. The stocks on hand at the end of last month show a large increase—2563 tons. They include 1150 tons of Anaconda matte unsold. The visible supply has increased 3333 tons. The arrivals in Liverpool last month were 2383 tons from Chili, and 4125 tons from other countries. The arrivals from the United States equal, in bars, ingot, matte, etc., about 1804 tons fine copper; and the arrivals in France from this country were 475 tons fine. The Chili charters for the month were 3600 tons.

The Chili exports of copper for the year up to the 1st inst., according to James Lewis &amp; Sons' report on ores and metals, are equal to 27,912 tons fine; this is about 2000 tons less than for the same period last year. Including stocks of copper on hand and that afloat, the total visible supply abroad is now 66,201 tons fine.

As showing the increase of American ex-

ports it may be stated that the imports of American copper into Liverpool and South Wales for the first eight months of 1882 were 460 tons; first eight months of 1883, 5314; in 1884 the amount was 9724 tons; in 1885 it was 16,440 tons. In the last eight months, however, it has been only 11,040 tons. We now export more than all other countries, Chili excepted. At last advices by mail, when Chili bars were selling for £39, 5s cash, the price for three months prompt was £39 17s 6d.

## Reduction and Sampling Works in Oregon.

While Oregon has many mining districts in a partial state of development, the quartz miners have had little encouragement to work their claims properly, since they have not had facilities for sampling or beneficiating their ores. A few large mines like the Virtue have made good records, but there are hundreds of gold quartz mines in different parts of the State which are only partly opened from lack of reduction facilities. Men have not been able to market their ores, so that the quartz industry has been badly retarded. Within the past year or two the mines of Oregon have attracted more attention, and now, we are pleased to note, facilities are being afforded to work the ores. Those in that State who have ores for sale and no opportunity to reduce them will now have the advantage of custom works in a central locality, and at the point where transportation companies concentrate.

A complete plant for sampling and reducing ores has been purchased in this city for the Portland Reduction Works. It includes a 40-ton wrought-iron water-jacket smelting furnace for galena ores, a No. 5 Baker pressure blower, with a Westinghouse engine to run it, a 50 horse power horizontal tubular boiler with the necessary feed-pumps, etc.; tank and pump for water supply, a Westinghouse engine for use in the reduction works, a Kendall stamp mill, a Dodge rock-breaker, a set of Cornish rolls, a Chile sampling mill, etc.

These, with the other machinery, were furnished by Parke &amp; Lacy, dealers in mining machinery in this city and Portland, Oregon, and will outfit a very complete sampling and reduction works. The smelter is a duplicate of those used at the Selby Smelting Works at Vallejo Junction, the largest works of the kind on this coast. They have run this kind of smelter at their new works for over a year without any stoppage. The rock-breaker, stamp mill and chute mill are used in all well-equipped sampling works in this country, and are duplicates of such orders as Parke &amp; Lacy have furnished the Richmond Mining Co. and Eureka Consolidated Co., of Eureka, Nev., the Sunny Corner mines of Silverton, Australia, Broken Hill mine of Australia.

These reduction works will be ready to treat ores for any mine-owners on a liberal basis, and are expected to start up on October 15th. This will open up a means for prospectors and miners to dispose of their products or convert them into bullion, getting their coin returns immediately. This makes the discoverer of a mine virtually independent of the capitalists, as is not the case when he works his own ores and has to put up a reduction plant. These works will tend to open up a large section of mining country that is now undeveloped on account of there being no place where the miners could get their ores worked.

**A PATENT INFRINGEMENT.**—In the case of W. H. Foye vs. Harrison P. Nichols, an action in which damages were asked for an infringement of a patent for an improvement in rotary plows, the defendant, against whom the action was decided, objected in the United States Circuit Court to Master in Chancery Houghton's assessment of the damages. Judge Sawyer overruled the objection, or rather exceptions, and entered a final decree in favor of the plaintiff.**DESPITE** the temporary closing of the Anaconda, the mills and smelters of Butte are treating 2000 tons of ore every 24 hours, or about as much as all the other mines in Montana are producing outside of the Butte district.

J. A. BAUER, treasurer of the Mechanics' Institute, has paid off \$15,000 of the mortgage on the Mechanics' Pavilion, leaving \$90,000 still due.

## Hydraulic Gravel Elevators.

Pioneerville, Idaho.

[From our Traveling Representative, FRANK W. SMITH.]

This camp was appropriately named and is on Grimes' creek, some 18 miles up the basin from Idaho City, the county seat. The place should be called "Willsonville" now, as Hon. Benj. Willson, an old-time Californian, owns nearly all the end of the basin in which Pioneerville is located. The upper end of the basin boasts of nearly every kind of mining—placer, seam and quartz. Over 100 miles of ditches drain Grimes' creek and its tributaries, all of which is owned or controlled and used in extensive development by "Ben" Willson, as he is familiarly known hereabouts. A proper description of Mr. W.'s mines and mining interests would fill a book, hence want of space forbids much more than a brief mention here.

Of Mr. Willson himself much could be said, and his record as a mining man is one worthy of emulation by not only the present but the coming mining man as well. It is said that genius and wealth seldom go together. As a rule, a man of genius is a crank, and he is invariably as poor as "Job's turkey." Mr. Willson is an exception to the rule. He is an inventor, a thorough, practical, hard-working millionaire miner. The representative of the MINING AND SCIENTIFIC PRESS visited the "Big Muddy" gravel mine, where two mammoth hydraulic gravel elevators were thundering away, lifting great beds of rocks and debris from the bedrock and depositing it with a large head of water into flumed sluice-boxes nearly 30 feet high.

## The Hydraulic Gravel Elevator.

The object is to raise solid substances from a pit or excavation, or gravel and debris from a flat to a higher level by means of a stream of water projected under pressure through a pipe or tube. The feasibility of the invention has been demonstrated beyond all doubt. The machine has been so arranged that it can be adjusted to the various positions necessary as sinking or excavation of ground continues, and sizes to suit the requirements of a miner or a district can be had. The elevators at work here are much larger than could be used by the average miner, hence the reader must not be misled with the idea that all these machines are too large to be used by a man of moderate means. A glance at the engraving, given herewith, will give the mining man an idea of what this much-talked-of machine looks like at work, and the following memorandum of the mechanism will enable the mechanic to grasp the theory "the beast works on." A number of vertical pipes, 18 inches long, lined with steel or white iron, are fastened together, enough of them to reach to the height desired. The lower section is made conical or bell-shaped, so as to form an enlarged air chamber, into which a 5½-inch nozzle projects from below. The power pipe, a 20-inch one with a 300-foot pressure, is attached to the nozzle at the lower end of this bell-shaped section. A branch pipe leading from the side of this bell chamber downward and into the pit or excavation, curving so as to lay flat on the ground a few feet after reaching it, is called the suction pipe. It also is lined with steel or iron, to prevent wearing. The water pipe which leads the water to the nozzle curves upward at its lower end and is connected by a ball-and-socket joint with a short vertical section. The nozzle is made independent, so as to slide up and down in the short vertical section, which increases or decreases the suction as the nozzle is approached or withdrawn from the contraction or upper end of the bell-shaped chamber. A set of screw rods that can be worked from the outside enables this nozzle to be moved at pleasure and without shutting off the water. The stream of water entering the nozzle through the lower end of the bell-shaped chamber, and passing through the contracted opening of the upper end of this section, creates a partial vacuum in the bell-shaped chamber below, with which chamber the branch or suction pipe is connected. A head of water and two little giants bring the gravel and debris to the head of the suction pipe, passing through a few sluice-boxes and a 2½-inch grizzly into the opening in front of the hungry suction pipe, into which the great bed of moving debris and dirty water disappears like water pouring over falls. The material is forced through the ver-

tical sections at a lightning pace, and against a steel-lined inverted sluice-box, and drops into the sluiceway prepared to carry it away, and is rushed down the boxes at a pace it never could have attained without elevation. A suction pipe on either side of the bell-shaped chamber is often attached, thus enabling the two to be used alternately—both cannot be used together. This is of especial advantage in working two sides of a creek without having to move the pipes around. Of course the amount of material handled by these machines depends on the capacity of the elevator, the power and the character of the ground worked. The elevators used here have worked more ground during the past two years than a hundred men would have done the old way in a lifetime. Only three men to the machine are used here. Acres upon acres can be worked without moving the elevator and the altitude of the lifting qualities of the elevator can be raised by reducing size of the suction pipe, and increasing size of water-power pipe and the pressure. These machines are made by the Joshua Hendy Machine Works, San Francisco.

#### Pioneerville "Forkings."

Willson pays out about \$6000 per month to run his claims.

A 200-acre ranch is cultivated by Mr. Willson in addition to working his many mines.

November 15th generally finds the water failing so fast that all placer claims are closed down.

"Placer King Ben," as he is sometimes called, is noted for his liberality, and is always a friend to the poor.

In speaking of one of his model saw-mills, Ben said: "I have just put in a new chisel-saw (one of Spaulding's). I saw his ad in the PRESS, and it is the best I ever saw. I wouldn't give it for all the rest combined."

The Mammoth mine, 12 miles above Pioneerville, shows a four-foot vein of free-milling \$20 gold ore. Development to the extent of a 300-foot shaft and the vein tapped by a 700-foot tunnel. The mill is a water-power, wet process.

If all of Ben Willson's placer and quartz mines were carefully and truthfully represented, the account would read so much like a romance that there would be more doubters than believers.

THE creditors of the "Forty-nine Mining Company" have petitioned the Superior Court to declare the company insolvent. These creditors and their claims are: Golden State and Miners' Iron Works, \$2136; Justinian Caire, \$194.70; Eugene Woodin, \$189; Vulcan Powder Company, \$37.50; Dunham, Carrigan & Co., \$15.73; total, \$2,572.93. The property of the company was attached in Tuolumne county, at the suit of S. S. Bradford, on the 7th inst.

No hydraulic mining carried on in Nevada county. All reports otherwise are malicious and made for an opportunity to harass the people living in the mining regions.—*Foothill Tidings*.

THE English mill property near Reno was on Saturday formally transferred to the new smelting company, the full amount of \$90,000 being paid.

SINCE the Navajo mill started up on the 20th of last May, it has produced 90 bars of bullion, valued at \$180,000.

GRANITE DISTRICT, White Pine county, Nev., is attracting much attention in the eastern portion of the State.

CALICO DISTRICT has produced since January 1, 1884, the sum of \$2,387,484 in bullion.

#### Mechanics' Fair Notes.

##### Electric Lighting.

Among the many beautiful exhibits at the Mechanics' Fair none has attracted more attention than that of the California Electric Light Company. Their principal exhibit is located on the Larkin street side of the gallery and consists of two beautifully furnished rooms lighted with over 60 incandescent lights. The lights are distributed in a very attractive manner. In the centers of the rooms are elaborate electroliers; on the walls are side lights. Lights are also seen burning under water, among fruits and flowers and hanging from the ivy decorations like "apples of gold." The lamp employed is known as the Swan lamp—the invention of Mr. Swan, of England, who claims to be the first inventor of the incandescent lamp as now generally in use. The carbon filament of this lamp is made from a cotton thread, which is first converted into parchment by the use of sulphuric acid. This parchment is then converted into carbon, which is afterward placed in a small glass globe, from which the air is exhausted. The lamp is now ready for use, and is said to give a continuous light of 16 candle-power for

we hope the day is near at hand when this progressive company will be able to supply this light to all.

Mr. S. W. Shaw has on exhibition his combined "Disk Concentrator and Amalgamator" in operation. In construction and working it is radically different from the concentrators in common use. The chief feature is a circular copper dish in the shape of a very shallow cone with the apex turned downward, to which an eccentric motion of about one-half inch throw is communicated by a vertical spindle passing through the center, which is geared even to a light horizontal shaft running from 200 to 250 revolutions per minute. The disk does not revolve, being subject only to the eccentric motion, the result being the "panning motion," considered so necessary in all concentrating appliances. When in operation the movement of the concentrates is toward the center, where they are discharged. The tailings escape over the periphery of the disk into a circular trough. In order to assist or retard the motion of the pulp toward the periphery, a number of revolving radial arms are provided, to which are secured, at short intervals, small notched stirrers of sheet copper, which dip about a quarter of an inch into the pulp on the

E. G. Denniston exhibits one of the largest size silver plated copper plates used to catch the gold in the free-milling process. These plates are now used in all gold-mining countries, having first found favor in this State, where they are made. All well-equipped mills now use them.

The only specimen of a stamp quartz mill on exhibition is Day's prospecting mill, with vacuum attachment, at the stand of B. A. Harrison. It is small and worked by hand. At the same stand is a hand-power rock drill, with a vacuum arrangement similar to that applied to the battery.

C. H. Evans exhibits several of his positive-action steam pumps; also, Donaldson's oscillating engine with reversing gear, which occupies a very small space for the power developed. At this stand is also exhibited in operation the engine, propeller-wheel, etc., for a small steamer.

Several samples of quick-opening and full-flow faucets are at the stand of Wm. J. Hough, who also exhibits a very neat turbine for running sewing machines, intended for attachments to faucets or water-pipes.

The Paraffine Paint Co. has an interesting exhibit of samples of that product, together with specimens of building material, clothing, etc., showing the water-proof qualities of the paint.

S. A. Owen exhibits several handsome models of large steamers and launches.

I. L. Merrill exhibits an interesting variety of asbestos lagging for steam-pipes and boilers.

A direct-acting pump of new design, built by Joseph Pracy, has a stand near the main engine.

The exhibit of the Dixon Crucible Co., near the fountain, is very complete and well arranged.

The exhibit of Tibbal's sewer-pipe and tide-gate is of interest to house-owners who want to keep out sewer gas.

The *Pacific Press* makes a handsome display of superior typographical work at their stand, in charge of T. A. Kilgore.

A creditable display of tools and bar steel may be seen at the stand of G. & E. Pennington & Sons, near the main engine.

The electric automatic fanning mill, an ingenious machine operated by a small electric motor, has a stand in the north aisle.

Wainwright's sprinkler, by which a solid stream can be changed to a spray without turning off the water, is exhibited near the garden.

The exhibit of the California Wire Works, near the fountain, is one of the most complete and creditable displays of domestic manufacture in the fair.

The Siemens and Lundgren regenerative gas lamp is exhibited in the north aisle. It is so constructed that its downward flood of light is not obstructed by any supply pipes.

Warren Dunham exhibits a double-center cable grip of his construction. This grip is double and has many other novel features which attract attention from railroad men.

MAKE YOURSELF USEFUL.—A man who regards work as a hardship, an oppression, who looks upon the time given to his employer as a species of limited slavery, can never do anything well. He must take an interest in his work if he would excel. The true rule for a young man is to make himself as useful as possible to his employer. He should never feel satisfied with himself as long as anything in his power to promote his employer's interest is left undone. In this way his labor is rendered profitable. Promotion comes unsought and before it is expected. This is the secret of success.

HYDRAULIC GRAVEL ELEVATOR ON BEN WILLSON'S "BIG MUDDY" PIONEERVILLE, BOISE CO., IDAHO.

over 1000 hours. The electrical energy which supplies these exhibition lights is generated in the machinery department of the pavilion by one Charles F. Bruoe's shunt-wound, automatic dynamos. There is no outside regulation in connection with this dynamo, and the lights may be turned on or off without endangering the machine and with an economy of power proportionate to the number of lamps in use. Near this dynamo is another exhibition of incandescent lights being run from the same machine. An electric motor driving a fan is also being run from the same wires that supply the lamps. In the fly-wheel of the steam engine that drives the dynamo are three lamps attached to the spokes of the wheel. As this fly-wheel revolves very rapidly, the effect produced is a ring of fire.

Upon a board near by are 16 lamps which receive their exciting energy from the company's station on Jessie street. The wires which deliver the electricity to the large arc lamps lighting the machinery department and garden being "toped" for that purpose.

Taking the entire exhibit, it is the most complete of the kind that has ever been made on this coast, and reflects great credit upon the management. The praise that has been bestowed upon it by every one is deserved, and

disk. It is claimed that one machine will handle the pulp from five stamps, which is fed into the central hopper with one to two inches of water. The disk can be silverized and utilized to catch the free gold in the pulp.

The exhibit of concrete-and-iron work of Mr. P. H. Jackson is one which has attracted great attention. Mr. Jackson has made a number of inventions in this direction, and put them into practical every-day work. In next week's PRESS we shall give a fuller description of his systems of construction with concrete.

Several portable forges of improved design are exhibited by the maker, Geo. Cumming. One forge, for use in contracted places difficult of access, can be taken apart or put together in less than one minute. All these machines are supplied with Cumming's patent geared blower, which can create a blast of sufficient force to lift the cast-iron tuyere cap from its seat.

Near the north end of the machinery department is exhibited Navone's machine for hub and general boring, mortising and general drilling, Olsen's filter and heater for steam boilers, McGowan Bros.' emery grinder for reaper teeth and F. Korbel's exhibit of redwood tanks.

The Paragon window, both sides of which can be reached from the interior of the house, is exhibited in the gallery.

## MECHANICAL PROGRESS.

## The Scoring of Grindstones.

We recently referred in these columns to what was claimed as a new idea in dressing grindstones, a device by which the stone, in addition to its rotation, was given a lateral motion as well, to the end that the face of the stone might wear more evenly and avoid the trouble technically known as "scoring." A cotemporary, in referring to this improvement, says it is no new thing. We quote as follows:

In file-making establishments the lateral movement of the grindstone is a necessity, else the file blanks would speedily cut the stone into annular channels. In some machine shops, also, provision is made for the same movement. But if this sideways movement is absolutely reciprocal, the stone will be scored as surely as though there was no movement sideways, only the scores will be curved instead of straight. For instance, suppose the shaft of the grindstone has end play enough on its journals to allow of a lateral motion of one inch, and a cam is fixed on the shaft with that amount of throw, a stationary guide on which the cam works to be secured to the frame, it is evident that, when the stone has made one revolution, its periphery will be, in relation to a fixed line on the frame, in exactly the same place as when it started; and, in consequence, if a scoring point was held against the face of the stone, it would make a cut one inch sideways out of a direct line, but meeting, to make a continuous ring, precisely as though the stone had no sideways motion.

In order to prevent this continuous and uniform action, the lateral movement, in relation to the revolution of the stone, must be continually changing. For this purpose the driving belt should be on a pulley on a short countershaft, on which is also a gear wheel that meshes with another on the shaft of the grindstone. This countershaft is to be attached by boxes to the grindstone frame. The gear on the grindstone shaft should be wide enough on the face to allow the lateral movement of the stone without unmeshing the teeth of the gears. The cam is fixed to the grindstone shaft, and may have its throw either as a raised strip or as a score, to be guided by a holder fixed to the frame; but if the gears have even numbers of teeth—numbers divisible by each other—the uniform scoring cannot be avoided. So one gear should have an odd tooth—"a hunting tooth," as it is sometimes called—which will insure perpetual change. Thus, if the two gears had respectively 40 teeth and 80 teeth, there would be uniformity of throw; but with 39 teeth and 80 teeth, or with 41 teeth and 80 teeth, uniformity would be impossible. Half an inch is enough of lateral movement to the stone, and the relative sizes of gears are immaterial, so long as their disproportion in number of teeth is observed.

**IRON STREET PAVING.**—A new form of iron pavement has been laid on Madison street, just east of Dearborn, which is attracting a great deal of interest, not only from the average passer-by, but from practical men and those interested in the construction of a good and substantial roadway. The material used is of iron, rolled into the shape of small T rails, one and one-half inches high, laid with the flat side, or what is known as the bottom of the rail, up. This surface is an inch and a half wide, and has indentations across it at intervals of six inches, for the purpose of insuring a more perfect foothold. The rails are fastened together by being securely bolted with wrought-iron bars, and are laid an inch and a half apart. They rest on two-inch planking, and are secured thereto by staples which pass over the bolts. The pavement is laid in sections 12 feet in length by two feet in width, with stone blocking along the curb and next to the railroad track. The space between the rails is filled up to the street level with tar and gravel, thus making it perfectly water-proof. The merits of this pavement are said to be that it will keep in a smooth condition for a period probably longer than any stone or wood blocking, and is considerably less noisy than the stone. Charles Peck is the inventor, and the Chicago Iron Paving Company is engaged on the work.—*Chicago Industrial World.*

**ROLLING MOLTEN STEEL.**—With a view to making armor plates, Bessemer once tried the novel experiment of pouring molten steel between rolls revolving slowly and cooled by water passing through their centers. The rolls were expected to receive the fluid or semi-fluid steel and to discharge it solid. A plate of considerable dimensions was rolled. Fairbairn afterward in treating of the experiment said: "If this method could be carried out successfully we might look for larger and more homogeneous plates than is possible with the present system of puddle balls. We might, in fact, calculate on a continuous web of iron from the rolls on the same principle as that of the paper machine, provided the converting or leading furnaces are sufficiently large and numerous to keep up the supply."

**THE CORLISS ENGINE.**—Since the expiration of the original patents on the Corliss engine, many firms have manufactured them and put them upon the market, and usually each one claims some particular point of superiority over all others, and as a natural consequence these

engines are being used more extensively than ever before, and every engineer should be thoroughly posted on this valve gear, which possesses a great many fine points, and while it seems complicated to the casual observer, still to the initiated it is the simplest of all automatic valve gears, and it is one that admits more of a chosen adjustment of the several valves to their respective duties than any other extant, and yet we find men who have run them for years who are entirely ignorant of what it is possible to do with them, or even how the steam and exhaust valves are constructed and the manner in which they perform their work.

## Europeans Visiting our Manufactories.

Quite recently, two well-known German iron manufacturers visited Pittsburg with the view of making a comparison between our mode and facilities for manufacturing iron and steel and those of Germany. While there they remarked to a newspaper reporter as follows:

"We have traveled extensively in the West and have just arrived from Cincinnati. I am keeping a diary of our travels, so that we may benefit by our mission. Our chief object is to examine the methods of manufacturing steel in this country, together with the condition of the workmen. I confess that we have been surprised. America is far ahead of us in making steel. Their methods are quicker, more powerful, and their extensive use of machinery makes their cost of production much less than ours. For instance, here a billet of steel is put into the machinery and it comes out a finished steel rail. In Germany in making the steel rail it passes through the hands of many workmen.

"The social condition of the workmen in America is far superior to that of any workmen I have seen in any country. A few days ago I had my dinner with a German steel worker. He had just come from work, and really, the meal was such that workmen in Germany never see, even in their holiday time. I also saw in this man's house easy chairs, a lounge and a spring-bed. These luxuries are confined absolutely to the rich in Germany. Our workmen—that is, common laborers, earn about 90 cents per day, and skilled workmen about \$1.25. Provisions there are just about as dear as they are here. Altogether, Americans have much to be proud of. We are anxious to have a good look at Pittsburg, because wherever we have been manufacturers have said to us: 'Be sure and visit Pittsburg and see its natural gas.' The latter is really the great thing talked of all over the country."

## An Austrian Engineer's Opinion.

We clip the following from a late issue of the *Pittsburg Commercial Gazette*: Mr. Arthur Pehger, of Vienna, Austria, is in the city examining the manufacturing establishments. He is a civil engineer of some repute in his own country, and some months ago left to visit the industries of the New World. He arrived here some days ago, and found such interesting subjects of study that he has already overstaid his limit, and yet cannot make up his mind to leave. He was seen last night at the Seventh Avenue hotel, and said to a representative of this paper:

"I have been astonished with the advancement of this country in engineering. In some matters we are ahead, but in others America leads. I think on the whole, though, the United States has the advantage. But the most interesting place of all is Pittsburg, with its natural gas. I was astonished, and have looked into the mills and glasshouses with the deepest interest. It seems to be better fuel all around than any fuel yet discovered. But the most interesting of all the sights are the immense engines at the water-works. I don't think they are excelled in the world.

"Mr. Lowry has proved that his theory of upright engines is a correct one, and I spent several most pleasant hours up there. I was surprised, though, that he made only one pair of his engines compound. That is now the true theory. All the English locomotives are compound, having three cylinders, and Mr. Lowry should have carried out his first plan. I shall leave here to-morrow, but I shall not soon forget those immense engines."

**A POINTER FOR MOLDERS.**—A correspondent of the *American Machinist* writes: "I was making at one time some castings with a very steep joint. I used to get lake sand, wet it and sleek it up. One day a tramp came along and stood looking at me. Said he, 'Why don't you get some rags for that job and use them in the place of that sand?' I got some rags, wet them and put them on, and they beat all the parting sand and paper I ever tried."

**TRANSMITTING POWER.**—Experience has proved that the least practicable distance to which power may be transmitted economically by means of a wire rope is only about 50 feet. It has been demonstrated that compressed air can be conveyed a distance of one or more miles with greater facility and economy than is now done so extensively with steam. It has been used in tunneling and mining at great distances.

**A REASON WHY STEEL WILL NOT WELD AS READILY AS WROUGHT IRON** is that it is not partially composed of cinder, as seems to be the case with wrought iron, which assists in forming a fusible alloy with the scale of oxidation formed on the surface of the iron in the furnace.

## SCIENTIFIC PROGRESS.

## Recent Progress in Chemistry.

In a paper recently read before the New York Academy of Sciences by Prof. H. O. Bolton, of Trinity College, Hartford, Conn., the professor discussed the problems of chemical dynamics and pointed out the rich store of promise in this neglected field. Physic, he remarked, deals with three quantities—space, mass and time. Chemistry has long been content with studying the changes of matter in terms of space and mass only. The discovery of a time-rate for the attractions due to affinity is destined to throw new light on chemical science, and to render it capable of mathematical treatment.

A prodigious amount of work has been done in thermo-chemistry, and within a few years a multitude of isolated observations have been collected, classified and made available. The importance of this undertaking will be more appreciated in the future than it has been in the immediate past.

In all cases of chemical change, energy in the form of heat is either developed or absorbed, and the amount is as definite in a given reaction as are the weights of the substances involved; hence measurement of the quantity of heat set free or absorbed in chemical reactions often enables the chemist to determine the true nature of the change. For example, the exact condition of certain bodies in solution can only be conjectured from certain physical characters, few and ill-defined; but by thermic methods of investigation the bodies formed can be accurately ascertained. This is accomplished by reference to the laws of maximum work. "In any reaction, those bodies, the formation of which gives rise to the greatest development of heat, are formed in preference to others." Thus the thermometer alone, in skillful hands, determines the *a priori* necessity or impossibility of a reaction.

**NEW SOURCES OF ALCOHOL.**—A correspondent of *Comptes Rendus* obtains alcohol from turpentine. He says French turpentine oil reacts with acetic acid, forming several acetates with the formula  $C^{10}H^{10}C^2H^4O^2$ , which are of various properties. From these acetates are obtained various single valued alcohols,  $C^{10}H^{18}O$ , by heating with an equal weight of potash and five or six times the weight of alcohol in a closed vessel for 10 hours up to the boiling point. By the addition of water, the combination thus formed can be separated, and can be purified by distillation in a vacuum. A botanist of Germany has discovered what he considers will prove a new and economical source of alcohol or brandy. It appears that the pulp which covers the poppy seed contains saccharine matter, which, after due fermentation and distillation, produces a kind of brandy of an agreeable flavor. As this pulp has hitherto been thrown away, the discovery, it is said, affords poppy planters an opportunity of realizing more profit from their crops, without a very great expenditure of capital.

**AN INGENIOUS LITTLE INSTRUMENT** called the "hyalolypotype," or (more sensibly) hot pen, has been invented, by means of which drawings can be made on glass or glassy substances with a waxy composition, which is solid and somewhat hard at ordinary temperatures. The pen can be heated by gas or electricity, and when heated the waxy material flows easily from it, setting so quickly on the glass that cross patching can be done more rapidly than with ordinary pen and ink, without risk of blocking up the angles. Corrections can be made with a pen-knife. After the drawing has been made, the plate is etched by fluorid acid, and when complete it can be either electrotyped, stereotyped, used directly, or applied to any purpose for which engraved surfaces are required.

**THE NOISE OF THE FINGER.**—Dr. Hammond says that when you place the end of your finger in your ear, the roaring noise you hear is the sound of the circulation in your finger, which is the fact, as any one can demonstrate for himself by first putting his finger in his ears, and then stopping them up with other substances. Try it, and think what a wonderful machine your body is, that even the points of your fingers are such busy workshops that they roar like a small Niagara. The roaring is probably more than the noise of the circulation of the blood. It is the voice of all the vital processes together—the tearing-down and building-up processes that are always going forward in every living body from conception down to death.

**GENESIS OF A SALT MINE.**—On the eastern coast of the Caspian Sea a curious phenomenon is in progress. The Kara Bobhas is an estuary nearly separated from the main body of the sea by a bank through which there is an inlet. The evaporation from this gulf is so great that a current continually sets in from the Caspian; and as there is no return current the water of the gulf becomes more and more saliferous, and a deposit of salt is in course of formation. In time this gulf will be cut off from the Caspian, and will then be dried up and become an extensive salt bed.

**AN OPTICAL ILLUSION.**—M. De Parville has called the attention of the French Academy of Sciences to a curious illusion of the vision which may account for the apparent oscillation

or swinging of stars, sometimes observed. When the eye looks for some time at a small, feebly-lighted body, itself being in complete darkness, the body appears to oscillate or describe certain curves. It is a phenomenon of the subjective order, and appears to be of the same nature as the movement of a star observed when a person leans the head against a wall and fixes his eye upon the star. The star appears to be agitated in its place and to oscillate rapidly. In order that the motion may be noticed, there should be no moon, and the sky should be clear.

## Thunder-Storms.

The cause of the phenomena of thunder-storms, in the present state of our knowledge of atmospheric electricity, is quite obscure; but the fact that their frequency and violence is evidently increasing in all civilized countries at least is inducing a more careful study of them. It is to be hoped that more light will be thrown upon this interesting matter by a comparative study of the frequency, severity and other phenomena during a lengthened period of time and on extensive geographical area.

The Germans appear to be taking the lead in this study, and from certain meteorological statistics recently published in Germany we learn that thunder-storms in that country have, during the last 30 years, been steadily increasing, both in frequency and severity. The number of deaths per annum from lightning has also increased in a far greater ratio than that of the increase of population.

The German savants incline to the opinion that the increase is to be attributed to the enormously increased production of smoke and steam which has taken place during the last three decades. But, although we may admit this to be to some extent a probable cause, yet, when we consider the very local character of thunder-storms, we should naturally expect to find that it would follow that the neighborhoods of large cities, and especially of manufacturing districts, would suffer the most severely. But the statistics referred to show distinctly that the very reverse is the case. The number of storms attended by fatal results from lightning is far larger in the agricultural districts than in the towns. Upon the other hand, we ought to take into consideration the protective action of lightning conductors, with which the prominent buildings in the towns of Germany are well provided.

**FACTS ABOUT THE COMMON HOUSE-FLY.**—The house-fly begins to make its appearance in July, becomes abundant toward the end of August, and lives from that time till killed by cold weather. The eggs are deposited in the ordure of stables, whose warmth hatches them. The larva hatches from the shell in the form of a small, white worm; from this it passes into the pupa state. The pupa is larger than the larva, and is of a dark-brown color. In this state the insect remains from 8 to 14 days, then comes forth the perfect fly. All flies and mosquitoes grow in the larva and pupa state, and after they acquire wings they do not grow any more. The smaller flies we often see with the house-fly are not the young of the same species, but another and a smaller kind. As all flies apparently perish on the advent of cold weather, it is difficult to tell whence come the fresh swarms with each recurring summer season, but it is supposed that a few do live through the winter in sequestered warm spots, and no doubt some lie dormant in the pupa state through the cold months. Thus enough are carried over to begin the work of propagation in the early spring. This work proceeds so rapidly that in a month or two a little one literally becomes 1000, and July finds us with our usual crop of millions of our familiar pests on hand.

**THE AUGUST ECLIPSE.**—The total eclipse of the sun which occurred August 29th—invisible in this country—belongs to the series occurring in 1850, 1868, 1886, 1904, etc., which series is remarkable for the extreme length of the period of totality. This time the greatest duration was at a point in the Atlantic, a little more than 400 miles southwest of Sierra Leone, where the sun was wholly covered by the moon for about 6½ minutes. On land the greatest duration, nearly five minutes, was at Ben-Guela, on the South African coast. A more readily accessible point for studying the eclipse, however, was found at Grenada, in the West Indies, where the total phase lasted a little less than four minutes; and this place was selected as the site of observation for a party of British astronomers, who no doubt spent the few moments so precious to science in efforts to add to our knowledge of the solar corona and other eclipse phenomena. We have not, as yet, seen any reports from observers.

**MORE EVIDENCE OF INTERNAL HEAT.**—From his studies of the Krakatoa catastrophe, Verbeek is led to maintain that the central part of our globe remains still in a molten state, and he disputes the theory which has been advanced that the heat of the volcanic furnaces is entirely due to local chemical action.

**ANOTHER NEW ELEMENT.**—A new chemical metallic element has been obtained from orthite of Arandal, by Professor Linneman, of Prague, who has given it the name of "aus-trium."

## Advice to Young Miners.

A nice young man, who writes that he is from the East and intends to engage in prospecting, wants us to give him some advice, says the *Denver Tribune-Republican*. That young man will be a brilliant success; he appreciates the eternal fitness of things; he knows where to apply for advice, and that in this great and glorious republic it is sold at from \$1 to \$10 a year, according as the chunks may be delivered in daily or weekly doses.

He has begun his training for a prospector's life in an admirable manner, which will do something toward fitting him for the fate in store. Notwithstanding all analogy would lead him to expect to obtain here all he asks for, he will be disappointed. The mining editor went out of the advice business several years ago. He confines himself now to a statement of facts, leaving people to be guided by them in whatever direction their stock of sense or idiocy may lead.

But we have been reading over several chapters of a book of advice, and if the nice young man will accept its contents, concentrated with a loss of nothing but worthless gangue, he is welcome to it.

In the first place, don't sit down on the edge of every hole you find and wait for some tender-foot capitalist to come along and buy it, especially if it be a silver prospect. Silver mining is in the condition of a graveyard, as described by Jim Fisk; those who are in can't get out, and those who are out don't want to get in. Nobody but a chump ever sits down to wait for some one to buy his hole in the ground. A nice young man of sense will go to work and change it from a hole in the ground to a decent prospect or a mine, if it contains the qualities which will make it such.

Don't be a chump. Nobody but a chump expects to make a paying mine out of a hole which shows no ore of paying value, if that hole be on a fissure vein. Nobody but a chump will neglect to prospect his vein along the surface to find a chimney or deposit of pay ore. Nobody but a chump will expect to make a paying mine out of a vein which does not show pay ore somewhere on the surface.

Don't be a chump. Remember that a mine out of which one cannot make money has no present value. Its prospective value depends upon surrounding conditions and indications. Indications which don't assay well are quoted 'way below par. A chump often goes half crazy over the discovery of a piece of rich ore as big as his thumb, and at night rolls up in his blankets and revels in dreams of wealth. The next setting sun finds him as poor as ever, when, if he be a thoroughbred instead of a grade chump, he immediately proceeds to paint things red.

The prospector who is not a chump works along steadily, reads and studies, and learns from observation and experience of others. He gets an occasional fairly good thing, sells it for a reasonable price, and finally moves down to Denver, buys a pretty cottage, and settles down to spend his days in comfort and peace, teaching his children not to be chumps.

**DECISION ON MINING LAND.**—Judge Deady delivered an opinion in the United States District Court yesterday in the case of the United States against Reed and Eccles. The case is one of considerable interest, having been brought to deprive defendants of title to a farm under the plea that the land was mineral land. The farm in question is situated on Jackson gulch, a short distance above the town of Jacksonville. Vast quantities of gold were taken out of this gulch some 30 years ago, but there has been no mining done in that vicinity for many years. The claim in question was located by an old miner who, if mining had been practicable there, would have sought for the gold in the ground instead of planting peach trees on it. It is well known that there is gold in all the gulches around Jacksonville, which could be mined with profit if water in sufficient quantities could be had. But it was held in this case that mining with profit was impracticable on the ground in question, and therefore the bill was dismissed. One singular feature in the matter is that parties who were instrumental in having the suit brought have lots of land in the same vicinity, which was taken up as agricultural land. From this decision it appears that even where land is known to contain mineral it can be taken as agricultural land if more valuable for that purpose.—*Oregonian*.

**UTAH MINING LAW.**—Utah's Supreme Court has decided that the original locator is entitled to the whole of a vein, a part of the apex of which is within his discovery, even if it shall be established later that the outcroppings of the vein are wider than the side lines of the location; that the discoverer is not restricted as to the width of his vein, but only as to its length. Another finding, which is new in mining jurisprudence, but which seems to be sound, is that where two veins unite into one in the depths the apex shall be considered as the point where they unite, and the oldest location shall hold the united vein.

The *Spearfish Register* (Dakota) speaks very encouragingly of the prospects of the mines lying west and south of that city, and feels confident they will develop into bonanzas.

## USEFUL INFORMATION.

## How Milk is Spoiled.

Milk will absorb odors at one time when it would not at another. It readily takes in vapors and odors from the air when it is at the same temperature or colder than the air that surrounds it, but parts with its own odors when warmer than the air with which it is in contact. When cold air touches warm milk, the air expands and becomes lighter and rises. As it expands, its capacity for holding vapors, gases, or odors, is so much increased that it is not only able to hold all the odors and moisture it contained before, but it is enabled to take in more, and hence it is ready to take up, and does take up, any odor or vapor which is volatile enough to rise out of the milk. Thus, cold air, even if it is not quite as pure as one might desire it for breathing, does not contaminate warm milk, but, on the contrary, actually becomes an aid in purifying it. A pail of freshly drawn milk, so long as it remains much warmer than the air in a stable, may stand in the stable unharmed, provided nothing but the air, or what is in the air, touches it. If a vessel of cold milk is placed in warm air, the effect will be reversed. When warm air touches cold milk, the air becomes condensed, and its capacity for holding moisture and odors is so much diminished that it becomes unable to retain the load it was carrying, and is forced to deposit its burden on the surface of the milk, to be absorbed and held in the milk or its cream in the same way that the air on a hot day unburdens itself on the surface of a vessel of ice-water, where the depositions become apparent in the form of dew. If a pail of warm milk and one of cold milk are placed side by side in the same stable, one may be growing purer and the other more foul at the same time, so much has the fact of temperature to do with the absorbing power of milk. Under the law of the diffusion of gases, aeriform bodies will, to some extent, force themselves into liquids like milk or water, when all are at the same temperature, but that law is largely controlled by relative temperatures.

Does the reader ask how stable odors do get into milk, if not absorbed by the milk after it is drawn? The answer is, they get into it through the breath of the cow. Standing in a stable filled with foul air, a cow cannot avoid taking in at every breath the odors with which it is loaded. Upon entering the lungs they are forced at once into the circulation. The blood becomes charged with them, and the milk, which always serves as a means of unloading the blood of its impurities, as well as its nutriment, also becomes loaded with the odors intensified, greatly to the disgust of those who use the milk. It is surprising to those who have never carefully noted the facts, how soon and how effectually foreign odors, good or bad, are taken into milk in the air breathed by milk-giving cows.

There is no surer way of befouling milk than by forcing cows to breathe the confined air of their stables, saturated with the fumes of their perspiration and excrement. The consequence of breathing such odors is so plain and certain that it seems strange that it should be permitted to the extent it is. The assumption so commonly made, that the milk absorbs the scent after it is drawn, is doubtless one of the prominent causes. It is time that delusion was dispelled, and that dairymen should appreciate the fact that if they are to have pure-smelling and pure flavored milk when their cows are in the barn, they must contrive to keep the odors of the stable from the nostrils of their cows and give them pure air to breathe. Hurrying the milk out of the barn may be a good thing to do, but it will not remove the common cause and frequent occurrence of stable odors in milk.—*Live Stock Journal*.

**A HAT WHICH TAKES PHOTOGRAPHS.**—The last new thing in hats beats all that has gone before it, and is scarcely likely to be equalled by anything that can follow after it. Herr Luders, of Gorlitz, has patented a photographing hat. The novel headress contains in its upper part a small photographic apparatus and a number of prepared plates. In the front of the hat there is a small circular opening, behind which the lens is fixed. By means of a string on the outside of the hat, its wearer, whenever he finds himself enjoying a pleasant view or attended by an agreeable person, can instantaneously photograph the landscape, the lady or the gentleman, unconsciously, within the range of the instrument.

**THE KING OF SPIDERS.**—A French entomologist has described the bird-spider of tropical America, the largest of the several hundred known species of spiders, as a formidable creature having a body four and a quarter inches long, or a diameter of seven inches with the legs extended. Its nest, in the center of which its 1500 or 2000 eggs are deposited, is so strengthened as to be capable of arresting a small bird; and the spider is sufficiently powerful to destroy not only young birds and adult humming birds but large lizards and reptiles.

**LUMINOUS STONE.**—A method of utilizing the luminous powder prepared mainly as a sulphide of calcium for admixture with cements, plaster of paris and concrete, has been recently invented by E. Ormerod and W. C. Horne, of London, the object being to prepare the articles

with a self contained phosphorescent property, instead of coating them with a luminous paint. As an example, the patentees take of cement, such as is known as Keen's Parian or other suitable make, in varying proportions, as, for instance, two pounds to five pounds to one pound of the luminous powder; mix the same with water, and then mold it to required shape in the usual way, or lay it on to ceilings or walls by means of a trowel. The patentees attach importance to placing the molded articles, as soon as they have been dried, in a bath of paraffine wax and benzoline or other suitable weather or water-proofing substance. In the case of using the luminous cement upon a wall or ceiling, they sponge or brush the surface over with a solution of paraffine wax and benzoline or other suitable damp-proofing solution. The uses of a luminous cement are manifold, e. g., for the garden—luminous concrete as edging to garden paths and carriage drives, for guides and beacons at the entrance gates of drives, insides of stables, the base of balustrades, or the entirety of balustrades. For roads—as luminous beacons at corners of dark country lanes, and at the ends of bridges, ends of walls, and curbs of foot-paths. For docks—for edging of piers and wharves. For water works—for the safety and dispatch of night work by the erection of luminous guides and beacons, and for fire-plug notices on walls. In short, for any places where the light of day will sufficiently excite the phosphorescent property as to render the cement or concrete work luminous by night.

**ACIDS IN LUBRICATING OILS.**—How acids in lubricating oils can be detected is told thus by *Power*: By analysis in a laboratory, or by putting the sample to be tested in a clear glass bottle with a copper wire running down through the cork air tight. Stand the whole in a sunny place and leave for two or three weeks; then if on removal verdigris or green rust is on the copper, there is an acid in the oil. This is a rough effective test for engine-room use.

**TO PREVENT THE CRACKING OF WOODEN FAUCETS, etc.,** put the articles in melting paraffine, and heat them there at a temperature of 212 degrees F., until bubbles of air cease to escape from the wood. The whole is then allowed to cool to about 120 degrees F., when the wood is taken from the bath and cleaned from the adhering paraffine by rubbing with a dry piece of cloth.

**SALT IN SEA WATER.**—If a box six feet deep were filled with sea water and allowed to evaporate under the sun, there would be two inches of salt left on the bottom. Taking the average depth of the ocean to be three miles, there would be a layer of pure salt 230 feet thick on the bed of the Atlantic.

## GOOD HEALTH.

## Poison in Milk and Cheese.

The frequent reports of cases of apparent poisoning from eating cheese, milk and ice cream has led to a careful scientific examination of those substances, with a view to ascertain how the poison exists therein. About a year ago, says an exchange, Dr. Victor C. Vaughan, of the University of Michigan, succeeded in isolating, from some samples of cheese that had produced alarming symptoms in many persons, a highly poisonous ptomaine, which he named tyrotoxin (cheese poison).

His knowledge has been gained largely through experiments upon himself and some of his more enthusiastic students. He found that the same symptoms were produced by the isolated poison as had been observed in those who had partaken of the affected cheese. They consisted principally of dryness and constriction of the fauces, nausea, retching, vomiting and purging. Although in several cases the illness was very severe, all finally recovered.

Further investigations have led to the discovery that tyrotoxin may be developed in milk, and is probably responsible for the several cases of poisonous ice cream that have recently puzzled the medical authorities. It is also believed to have an intimate connection with cholera infantum and kindred diseases, a view that is sustained by the severity of its effects upon young animals.

It was found by Dr. Vaughan that milk which was presumably normal when first obtained yielded crystals of the poison after long standing in a tightly-closed bottle.

A sample of ice cream which had made 18 persons quite ill was also examined by the same method, and the aqueous solution of the tyrotoxin was given to a cat. The effect was distinctly noticeable in 10 minutes, when the animal began to vomit and show other characteristic symptoms. There seems little doubt that the poisonous element in the cream was due to the presence of the alkaloid.

Dr. Vaughan is of the opinion that the production of the poison is due directly or indirectly to the growth of some micro-organism.

The presence of butyric acid has been demonstrated in the specimens of cheese, milk, and cream from which the poison was obtained, and it has been suggested that the generation of the tyrotoxin was the result of a butyric acid fermentation. It is known that the action of the butyric acid on ammonia produces an alkaloid known as coniine, and it is quite possi-

ble that tyrotoxin may be formed by the action of decomposing nitrogenous substances on butyric or other fatty acid. From its physiological effects, it has been inferred that the alkaloid contains two poisons.

**THE ACTION OF THE HEART.**—As with each stroke the heart projects something like six ounces of blood into the conduits of the system, and as it does so some 70 times every minute and 4200 times in an hour, this implies that it does the same thing 100,800 times in 24 hours, 30,000,000 times in a year and more than 2,500,000,000 times in a lifetime of 70 years. The mechanical force that is exerted at each stroke amounts to a pressure of 13 pounds upon the entire charge of blood that has to be pressed onward through the branching network of vessels. According to the lowest estimate that has been made, this gives an exertion of force that would be adequate, in another form of application, to lift 120 tons one foot high every 24 hours. Yet the piece of living mechanism that is called upon to do this, and do it without a pause for three-score years and ten, without being itself worn out by the effort, is a small bundle of flesh that rarely weighs more than 11 ounces. It is in the nature of the case, also, it must be remembered, that this little vital machine cannot be at any time stopped for repairs. If it gets out of order, it must be set right as it runs. To stop the beating of the heart for more than the briefest interval would be to change life into death. The narrative of what medical science has done to penetrate into the secrets of this delicate force-pump, so jealously guarded from the intrusion of the eye that it cannot even be looked into until its action has ceased, is, nevertheless, a long history of wonders.—*Edinburgh Review*.

**A PHYSICIAN'S PREDICTION.**—A recently published volume, the work of Dr. Austin Flint, of New York, is said to contain a remarkable prediction respecting the progress likely to be made in medical practice in the next 50 years. A press notice of the book says that the author expresses great confidence that the principle of the telephone will, by and by, be applied to intrathoracic respiratory and heart sounds, so that they will be transmitted to the ear more distinctly than they now are by the stethoscope. As consequences of this advance Dr. Flint points out that not only will these sounds be transmitted from the patient to the physician, no matter how distant the one may be from the other, but also that "the sounds from the chest of a patient may be phonographically registered, transported ever so far, and made available after an indefinite period."

**EFFECTS OF MENTAL OVERWORK ON THE TEETH.**—According to the *British Dental Journal*, the teeth of hard-worked pupils of the Paris public schools deteriorate a few weeks after their entry. The second dentition is often premature. Dr. J. S. Williams has shown that any mental strain shows itself upon the teeth in a very short time, both in increased decay as well as in increased sensibility of the dentine. Dr. D. M. Parker has reported that these same changes are always apparent in men who are in training for athletic trials. These observations show that they are matters which demand serious consideration from educators. Certainly a good education ought not to bring decay to any organ of the body, but the reverse. The fault must be with the system of education rather than with education itself.

**TREATMENT OF A DOG BITE.**—Persons who have been bitten by dogs, whether mad or otherwise, should at once cleanse the wound very thoroughly with warm water. If the dog is believed to be mad, after cleansing the wound suck it with the mouth, so as to draw out as much blood and fluid from the part as possible; continue this for some time. If this cannot be done by the sufferer, then some friend should do it for him. There is not the slightest danger in this operation unless there is some abrasion on the lips or in the mouth. After this has been done, cauterization may be resorted to, but it is hardly necessary. To be doubly sure, let the bitten person take, if possible, Turkish baths two or three times a week for six or eight weeks. This of itself is a very excellent preventive, from its cleansing effects.—*Herald of Health*.

**BLINDNESS DUE TO DECAYED TEETH.**—Dr. Widmark, a Swedish surgeon, having as a patient a young girl in whom he was unable to detect the slightest pathological changes in the right eye, but who was yet completely blind on that side, observing considerable defects in the teeth, sent her to M. Skogsborg, a dental surgeon, who found that all the upper and lower molars were completely decayed, and that in many of them the roots were inflamed. He extracted the remains of the molars on the right side, and in four days' time the sight of the right eye began to return, and on the eleventh day after the extraction of the teeth it had become quite normal. The diseased fangs on the other side were subsequently removed, lest they should cause a return of the ophthalmic affection.

To apply a mustard plaster so as not to blister the skin, mix the mustard with the white of an egg instead of water. The plaster will draw thoroughly without blistering the most delicate skin.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—Cor. Amador Ledger, Sept. 18: The disposition of the property belonging to the Eureka mine is progressing rapidly. The framework of the 40-stamp mill has been sold to parties in town and several persons are having cheap buildings put up on the strength of this purchase. I have nothing new to report with regard to the future of the mine; the prevailing opinion is that everything will remain quiet for some time. A slight accident occurred at the South Spring Hill mine a few days ago. A portion of the hoisting machinery gave way. The men were in the mine at the time and were compelled to climb out by means of the ladder. Mechanics are at work, and everything will be running smoothly in a short time.

## Butte.

**WEST BRANCH DISTRICT.**—Butte Record, Sept. 18: Mr. James Peale was down to-day from the West Branch Mining District and gives a favorable account of mining prospects in that vicinity. A tunnel is being run in the Holborn claim, and it is expected that pay dirt will soon be reached. It has heretofore been worked by pining. The drift diggings of Mr. Smith is also making preparations for work. The supply of water for the claim is small and requires to be stored. The drift claim of John Dix is also being successfully worked. Altogether the prospects of a successful mining season are confidently anticipated by those interested in mines in that vicinity.

**NEW QUARTZ MILL.**—Oroville Register, Sept. 16: Oregon Gulch in early days was famous for its gold mines, and now it looks as though the source of the gold, the parent quartz ledge, was about to be developed as a paying mine. A tunnel has been run a distance of 300 feet and the ledge struck. Side tunnels are now being run north and south to open and develop the ledge. The rock prospects well and almost assures \$10 a ton. The ledge is 8 feet wide and continues to improve in richness the more it is developed. The foundation for a new 10-stamp quartz mill has been laid and a part of the machinery is already on the ground, while the remainder will arrive this week. Mr. Charles Diter, superintendent, is pushing things as fast as possible, and expects to have the mill running before the middle of October. Mr. John Nesbit, one of the principal owners in this mine, is an old and experienced miner and has worked for years in developing the lode.

## Calaveras.

**RICH ROCK.**—Calaveras Chronicle, Sept. 17: We were shown some specimens of very rich rock Monday last, they were taken from the lead owned by Mr. John Etchevery, near the Cold Spring Cottage. The rock was taken from a depth of 40 feet, at which point the vein is three feet in width. The rock shown us assays \$300 per ton.

**RED GULCH.**—Cor. Calaveras Chronicle, Sept. 17: It remains to be seen in these latter days whether the expected mining boom so long looked for will receive its proper impetus. The certain movements of capital taking place nowadays point to favorable anticipations in that direction, and many mines through this portion of the mineral belt will receive sufficient development, either to prove some of them paying mines or with adverse results, during the present and ensuing year. The present prospects that have been recently opened here will prove to the mining world that ore containing gold in paying quantities will be extracted from them in the near future. Extensive mining work will be vigorously prosecuted, shafts will be sunk, tunnels run, mills and hoisting machinery erected and the work carried on on a grand scale. English capital is being introduced into this section, and should their efforts be crowned with success a prosperous era will undoubtedly follow, for there are mines that would pay well were they handled and properly developed, one of which I may mention, namely, the Foot & Thompson. This is a ledge of large proportions, having produced a large amount of gold bullion in its early history. At no distant day this will prove to be a paying property. It is at present idle. The Butcher John mine near here is being blessed with a rich strike. The shaft is 40 feet in depth with a good-sized ledge in the bottom. Some of the ore will go well up into the hundreds. Some good news has reached us from West Point and the mines adjacent to that locality. The Keltz mine is yielding splendid dividends to its owners. Ore which is refractory is being shipped to Selby's Smelting Works at Vallejo. The Soap Root mine, owned by John Henry, has shipped 40 tons of sulphuret ore to the same works. The Lockwood mine, with 11 men, is producing two tons daily of ore yielding \$70 per ton. The Water Lily mine has taken the lead, showing a four-foot ledge of fine sulphurets and galena which is literally spangled with gold. The Fine Gold mine, near Railroad, continues to ship gold bullion and is looking very well. It employs 40 men.

**BONDED.**—Calaveras Prospect, Sept. 17: The Rathgeb mine has been bonded to an English company for a large sum. A force of men have been employed in the work preparatory to building a 30-stamp mill, which will be erected on Calaveritas creek below where the old water wheel has stood for many years. The Banner mill has a contract to cut over 100,000 feet of lumber to be used mostly in the erection of the mill. Some of the heavy timbers are already on the ground, quite a number of laborers have been employed in and about San Andreas, and every one appears to feel that our town will soon assume a livelier aspect. There appears to be very little difference of opinion in regard to this mine, and there is no doubt but that it will prove to be one of the best paying mines in the county. It is not merely a prospect but a well-defined lead which shows for itself.

**BIG MILL.**—Mountain Echo, Sept. 15: Lumber has been hauled to the Gold Cliff mine, preparatory to commencing operations. The mill, as before stated, is to be a 60-stamper, and will have a crushing capacity of about 140 tons per day. When the

quartz mills now in course of construction in this mining district are completed (including those in operation), the aggregation of stamps will be over 140.

## El Dorado.

**MILLS AND STRIKES.**—Sacramento Record-Union, Sept. 22: The quartz mines in the neighborhood of Shingle Springs are looking fine and some are paying quite handsomely. The Vandalia mine was recently sold to Kelly, Ives & Co., of San Francisco, for \$20,000, who are planning the erection of a new mill. This mine is situated five miles south of Shingle Springs, near the Big Canyon gold mine, formerly known as the Orofino. The latter is having erected a 20-stamp mill, a carload of the machinery of which went up from this city yesterday. Those mines have been sufficiently prospected and developed to show a large quantity of pay ore, and their yield is no uncertainty.

The Barnes mine, three miles east of Shingle Springs, on what is known as the "Blue Stone ridge," has again started up after lying idle for several months. This is one of the most regular paying mines in the State, is easily and cheaply worked, and has proved a veritable bonanza to its owners. It is showing better ore now than on any of the upper levels.

J. W. Hodgkin & Co., of the Pyramid mine, have bonded the celebrated Gray mine on Gray's Flat, four miles northwest of Shingle Springs, and have commenced operations on a large scale. This is one of the most celebrated mines in the section. Several fortunes have been taken out of it, and the mine has never been systematically worked. The miners seem to have only coyoted out the rich pockets, and left the main body of ore. Some of the pockets, or rich spots in the ledge, paid as high as \$30,000 to the ton. It will now be worked for the first time systematically, and no doubt will pay handsomely. The Springfield mine and the Springfield extension, near Mud Springs, are being vigorously prosecuted, the former paying handsomely, the latter showing well, and promises to be equally as good, if not better, than the former. Several mines are being worked with profit in the vicinity of Log Town.

N. S. Miller, from less than a ton of ore from his mine, some four miles north of Mud Springs, some days since, with a hand mortar, took out \$1495. All of the ore is not so rich as that, yet none of it is barren. All pays well for milling.

Frank Miller has a mine near Missouri Flat which he has sunk a shaft upon some 50 feet. The ledge is three feet in width, has well-defined walls, and all the rock, from the surface to the bottom, which is easily mined and milled, averages \$11.50 per ton. Several mines in that section, also in the neighborhood of Sugar Loaf, are paying well.

The old Pacific, in the time of Placerville, one of the best pieces of mining property in the State, which has been idle for some time, owing to a "game of freeze out" that has been going on in the directorate, will start up in a few days. This mine employs upward of 100 men, and when it is running adds much to the life of the county seat.

Tommy Davidson has a mill running on a mine between Mud Springs and Shingle Springs, and is said to be turning out bars of bullion regularly.

There is quite a boom in quartz mining at Grizzly Flat. It is not a recent boom, but a continuation of a boom that commenced there some five years ago. Grizzly Flat has become a large and prosperous town, and the numerous quartz mines, her main support, seem to be permanent and inexhaustible. The mines at Uniontown and Coloma are paying well, the old Peterson mine at the latter place, owned by Sacramento citizens, declaring handsome monthly dividends.

The mines on the Georgetown Divide are equally as promising. New companies have gone into Greenwood, Garden Valley, Spanish Dry Diggings, Mt. Gregory, Georgetown, Georgia Slide and Tip-ton Hill districts, and the most flattering reports are heard from all.

## Los Angeles.

**COAL DISCOVERY.**—Orange Tribune, Sept. 10: Mr. D. N. Harwood called on us on Monday, and informs us that he has recently discovered an extensive vein of coal near his bee-ranch, in the Santiago canyon, and has very flattering prospects for a valuable mine. He has made a claim of 320 acres, has had the proper surveys made, and will commence operations toward opening the vein at once. He will put on a force of men and run night and day. The croppings are in sight, nearly half a mile apart, and the indications are good for a strong vein. This is a fortunate discovery, not only for Mr. Harwood, but for this part of the valley. The Santa Clara mine, which has hitherto supplied the coal for this section, has become exhausted, and work has shut down entirely. Mr. Harwood calls his new find the "North Star." We hope it will prove as good as it looks.

## Mariposa.

**INGENUITY AND ENTERPRISE.**—Mariposa Gazette, Sept. 18: In company with Mr. Geo. E. Crowell, a mining gentleman from San Francisco, on Tuesday last we visited Dr. Robinson, on Sherlocks, who has recently erected a five-stamp steam-power quartz crushing mill on the McCann mine. The new shaft, which is to the rise of 100 feet deep, is timbered with a view to safety, and no better piece of work have we seen in a mine. The plant of the new engine and the frame-work which carries the stamps and the mortar-bed is constructed with masterly skill, both for safety and durability. The little engine with all its compactness is a beauty within itself. It performs all that is required; pumps the water, raises the carloads of dirt and rock to the surface; each carload amounting to 700 or 800 pounds, using only 40 pounds of steam. The power of the engine can be increased sufficient to run 20 stamps whenever required. The stamp, bed-plate and mortar are all as near perfect as human ingenuity has thus far devised. No mercury is used in the battery, and it is claimed by the doctor that not a speck of gold escapes or is lost.

## Nevada.

**THE MEADOW LAKE MINES.**—Truckee Republican, Sept. 15: A writer at Meadow Lake says the new mill will be completed in a few days. The bond for the Excelsior mine is for \$60,000, contingent upon the success of the electric process. The season is too far advanced for any great amount of work to be done this year, but if the experiment is successful, there will be a live town at Meadow Lake next year. About 100 locations have been

made so far. A pack-train from Cisco, 12 miles, brings in stores and also carries mail to and fro.

**PENNSYLVANIA MINE.**—Grass Valley Union, Sept. 16: The lessees of the Pennsylvania Con. mine, on Kate Hays Hill, have had a crushing of 26 loads of quartz at Riley's mill. The yield exceeds \$40 a load without the sulphurets, which are said to be very rich, and will add from five to ten dollars to the value of each load of ore. The mine is showing up splendidly and the lessees and stockholders are sanguine in their expectations of the richness and permanency of the promising mining property.

## Placer.

**STRIKE.**—Placer Republican, Sept. 15: The expected strike in the Live Oak mine, west of the May Flower at Chappellets, took place on Monday of last week. Gold in big paying quantities was found sooner than expected, as the bedrock is still pitching. The best part of this new strike is that about 60,000 shares of the company's stock are owned by residents of this county, among whom are F. Chappellet, P. Cray, George Threlkel, C. T. Adams and others. Reports from Charles Harley's mine—the Excelsior—continue to be most favorable, as the prospect is better every day. New and heavy pumping machinery has been put in.

## San Benito.

**OIL.**—Hollister Independent, Sept. 14: A. J. Chaney, the driver of the stage between Hollister and the New Idria mines, informs us that the prospectors for oil in Grizzly canyon find every indication that the country can be made very productive. The appearance of the soil and the general features of the country all along the Tres Pinos and San Benito creeks are much the same as along the famous Oil creek in Pennsylvania. Of course this in itself amounts to no proof of the presence of oil, but there is the fact of a bed of coal existing near Erie and the oil springs in Grizzly canyon, which, taken together, have a possibility that at some future day that whole section may be rich in its oil productions. It is a matter well worthy investigation.

## Shasta.

**IRON MOUNTAIN.**—Shasta Courier, Sept. 18: Iron Mountain mine has again been experted by the representative men of capitalists who think they know good ore when they see it. The expert took away sample lots of ore. He made no hesitation in saying that the machinery hauled to the Mountain at great expense was of no use in the reduction of the ores there. Tons of the same quality of rock sent to Denver yielded from \$300 to \$500 per ton, failed to pay for working by the new mill machinery. Such ore cannot be allowed to run to tailings and waste. Iron mountain will soon boom again.

**STRIKE.**—Shasta Democrat, Sept. 15: The new strike in the Cressus mine, on Squaw creek, is turning out big, and consequently the owners are happy. Sunderhouse, Busch & Co., who have had a working bond on the Snyder mine, failing to make arrangements with the owners that would suit them, threw up the bond. Andy Fife has bonded the Habish mine, the first extension south of the Florida in Old Diggings district, and is preparing to set up his Huntington mill on the river at the mouth of Spring creek, where he will haul the ore a distance of two miles. Mining news from Deadwood is most flattering. The McDonald Bros. and Frank have "struck it richer than ever" in their lower level. The Wiley mine is turning out \$60 ore. Tom Green's mine is yielding richer than ever, and the Scorpion, Washington, Black Bear and Gibson mines are doing likewise, so says John Shed.

## Sierra.

**CLEVELAND MINE.**—Sierra Tribune, Sept. 18: The cleanup here for a 26-days' run amounted to \$3100. The prospects at this mine are improving daily, and an extra force of miners will be employed before many weeks.

**EMPIRE MINE.**—The Empire mine, situated in Gold Valley district, ten miles from Sierra City, is owned by a wealthy San Francisco company, with E. D. Ayer as superintendent. The mine drifts in about 300 feet. The lode or ledge averages eight feet in width. The ledge is a well-defined, true fissure vein, and runs northeast and southwest. The dip of the lode is an angle of 52 degrees. This lode will average from \$40 to \$50 per ton. An 80-stamp mill will be erected by next spring. A saw mill is now in course of construction. The store purchases of this mine are made at Sierra City.

**LIBERATOR GRAVEL CLAIM.**—The Liberator gravel claim, situated at Deadwood, a few miles below Downieville, is principally owned by John Wood and P. Dorsey. The running of a tunnel was commenced about two years ago, and up to date 1600 feet have been run. The prospects at this mine are good.

**POKER FLAT.**—Mountain Messenger, Sept. 18: This noted mining camp, whose canyons, gulches and river beds were so richly laden with gold nuggets in the days of the long ago, immortalized by Bret Harle, would scarcely be recognized by the old-time residents. The lower part of the town, down stream, where used to be crowded together hotels, stores, saloons and cabins, daily thronged with hundreds of busy miners, is now but piles of bowlders and debris, only a few roughly-constructed houses remaining of the once large and prosperous town. There seems to be, though, a prospect in the near future of a revival of at least some of the good old times gone by. Recently, in four days, \$1200 was pounded out of quartz from the Belmont ledge. W. F. Baker, mining on the west branch of Canyon creek, just above the falls, northeast of Poker Flat, has a good-paying placer claim. G. C. Wilbur, whose similar diggings adjoins Baker's, took out lately \$40 in a day. This is a good tract of mining ground. Frank Kinselback, of Alleghany, is here developing the Rattlesnake ledge, located a mile northeast of the Phoenix, and obtains good prospects. Jas. Kendall has done well in his gravel mine this year, and is preparing to resume work next season. Four men are working at the Belmont ledge, taking out pay. Balarat Co. have let a contract to run a hundred feet of tunnel to A. C. Burlington, through cement to bedrock. Gravel over the cement pays \$1.50 per carload, and beyond is expected to yield \$5. Simon Whitehead, Cold canyon, has reached fair-paying gravel. Rouse & Co., Deadwood, are rolling out gravel worth \$3.50 per carload. T. C. Corlette is sinking a shaft at the

head of Tennessee ravine, and has obtained encouraging prospects. His gold is the same as that of the Howland Flat lead. Brown, Hill & Co. are running a tunnel at Steamboat and have good prospects. Phoenix ledge, owned by Chas. Sutherland, is one of the most promising in Sierra county. Large pieces of ore, several pounds in weight, are ribboned with gold, and there may be here a second Sierra Buttes or Young America. Forest Queen Co., and whose ground adjoins north of the Grand Prize, propose to start a tunnel very soon, at the most practicable point, to develop their claim, considered valuable mining property. Sunnyside Co., west of the Grand Prize, have their main tunnel in about 500 feet, face in soft, dark slate rock, with prospect of pay gravel 100 feet ahead in the ridge.

## Trinity.

**NEW RIVER.**—Trinity Journal, Sept. 18: Mr. George Dean, of White Rock, arrived in town on Thursday and gives a favorable account of the New River mines. About 100 men are now in that district and none idle. The Ridgeway, Hard-tack, Mountain Boomer, Grover Cleveland, Tough Nut, Sherwood and other mines are taking out rich rock. Everything is flourishing.

**A BIG FIND.**—Mr. Jacob Bowerman tells us that Jesse H. Tourtellotte has struck a very rich spot on Rich Gulch, a tributary of Digger Creek, near Minersville. It is probably a pocket, the extent of which is as yet unknown. As much as \$60 was washed from a single pan.

## Tuolumne.

**OLD TUOLUMNE.**—Independent, Sept. 18: A trip to the Old Tuolumne mine, last week, satisfied your correspondent that pluck and energy, as well as capital, are necessary in mining. We found the mine in charge of Foreman R. C. Davis. The hoisting works and appurtenances are first-class, the pipe is four-inch gas pipe and the fall for hydraulic pressure unparalleled. We manned the ladder and descended into the mine by an incline shaft 150 feet deep in which a well-defined lead of varying thickness is visible all the way down. At the bottom of the incline drifts have been run north and south—the south drift running toward a rich ore body which appears on the surface. At the Experimental Gulch mine we find a decided change since our last visit. The buildings are finished, with the exception of the mill building.

## NEVADA.

## Washoe District.

**BEST AND BELCHER.**—Virginia Enterprise, Sept. 18: On the 600 level, west crosscut No. 1, being found to be in the west country rock, was discontinued. Crosscut No. 1 east was extended 34 feet, making a total length of 236 feet. A south lateral drift is now being run in the good quartz vein passed through in running west crosscut No. 1. This lateral drift is all in quartz of a very promising character, which may lead to something good. At the Osbiston shaft, the water being now fully under subjection, next in order comes the proposition to sink deeper. During the week the old southwest drift on the 2500 level, which extends through the Gould and Curry to the Savage north line, has been cleaned out and repaired for a distance of 350 feet, and the work is still being proceeded with. The object is to find a suitable belt of dry ground in which to sink a deep winze, instead of sinking the Osbiston shaft deeper. A large three-compartment winze is proposed to be sunk to the depth of 500 feet or more in Gould and Curry ground, the proposition being to carry it to a depth corresponding with the 3200 level of Savage, Hale and Norcross and Chollar and the Combination shaft.

**ALTA.**—On the 700 level, where all the work of this mine is being conducted at present, connection was made with the old Lady Washington shaft last Saturday, giving an excellent air circulation. An old drift to the northward at that point is now being cleared out and repaired to the distance of 140 feet, or to a point where good ore is known to exist. The south drift along the east side of the Keystone vein has been carried well into Alta ground. The good ore vein found several months ago in Alta ground by two crosscuts west, 25 feet apart, shows the vein to be from 3 to 5 feet in width, and not 15 or 20, as has been erroneously stated. It shows widest in the north crosscut, and is good ore that assays high and will pay well under the stamps. All preparations are made for crosscutting, and Supt. Boyle is awaiting orders from below in order to do so. There is a total distance of 1200 feet to be crosscut, and valuable results are anticipated.

**JUSTICE.**—A force of men will be employed at once, getting the machinery of the main Justice works in order for starting up the first of the coming week. The shaft is 1300 feet deep, but no regular drift explorations or ore-extraction work was done below the 1100 level. Work through this shaft was suspended five years ago, since which time but little work has been done in the mine beyond the extraction of a small amount of ore at the south end, through the Woodville shaft, by leasers. But little work was done at the north end of the mine, and in the present renewed operations it is proposed to develop the true merits of that section, as well as other ore-producing points.

**POTOSI.**—Diamond drill hole, No. 8, on the 3100 level, is in 140 feet. As before stated, it is being run in Chollar ground, but by the Potosi company, to test the large quartz vein which runs through both mines on the east of the main lateral drift. This drill hole was started about 550 feet south from the north line of the Chollar. The drillings yield low assays, showing the whole ledge to be mineralized.

**HALE AND NORCROSS.**—Crosscutting both east and west on the 3200 level, near the deep winze, and extending the lateral drift northward, constitutes the work being done at present. All this work is being done about in the middle of the mine, therefore 200 feet or more from the Savage south line.

**SAVAGE.**—On the 600 level the large ore vein or deposit developed shows a considerable amount of rich ore, which, if found to extend to the 800 level, will prove to be of great value. On the 800 level the lateral drift south to intersect the above vein is making good headway.

**SIERRA NEVADA.**—On the 520 level work in crosscut No. 3 west, near the face of the north lateral drift, has been suspended, and a crosscut

east, opposite to it, was started, which is now in 60 feet. Face in vein porphyry and other material, showing no value.

**CROWN POINT AND BELCHER.**—During the week over 100 miners have been put to work at ore extraction, the increase of water in Carson river allowing of a partial resumption of work at the mills. How permanent this improvement is remains to be seen.

**KENTUCK.**—Forty tons continues to be the regular daily yield. The Rock Point mill, where the rock is reduced, is only able to run a portion of its stamps owing to lack of water power in the Carson river.

**GOULD AND CURRY.**—The crosscut east from the upraise above the 150 level is in streaks of ore, promising better developments. It is being steadily extended eastward.

**OPHIR.**—The exploration and development drift south on the 1300 level is being steadily advanced. Material, vein porphyry with streaks of quartz and clay.

**UTAH.**—On the 500 and 1300 levels the drifts are being cleared out and the timbering repaired preparatory to further explorations.

**MEXICAN AND UNION.**—The drifts and crosscuts north and west on the 700 level are making good progress, with promising indications.

**OCCIDENTAL.**—The surface machinery, etc., is being put in order, ready for mining operations.

**YELLOW JACKET.**—Daily yield about 100 tons, keeping the Brunswick mill well supplied.

#### Columbus District.

**CANDELARIA MILLING CO.**—*True Fissure*, Sept. 18: The mill has been running steadily during the past week with one day shift. There are 20 stamps now running on Georgene. It will be shut down about Monday, when it will be cleaned up preparatory to making a short run on ore from the Enterprise. Superintendent Giguon is now surveying the pipe line to Trail canyon. The frame for the Georgene hoisting works is in place and the work is being actively pushed. It is reported that the Georgene Mining Company has been incorporated in New York.

#### Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, Sept. 18: During the past week ore shipments were made from the district to the two reduction works in town as follows: To the Richmond works—Kentuck mine, 2 tons; Mountain Boy, 1; Marguerita, 30; Monroe, 1½; Silver Lick, 15; Eureka Star, 2; Jackson, 37; Bullwhacker, 2; Eureka Tunnel, 10; Brown, 2½; Geddes and Bertrand, 7½; Reeves and Berry, 1½. To the Eureka Con. works—Bullwhacker mine, 5½ tons; Morey, 7; Dundersberg, 64; Summit, 7; Bay State, 11; Grant, 5½; Hamburg, 47; Featherstone, 8.

#### Gold Mountain District.

**LIVELY.**—*Candelaria True Fissure*, Sept. 13: Mining is quite lively in this district at present. Peter Anderson is running his two steam arastras on gold ore from his claims. He has about 12 men working in his several mines. They take out the ore and pay him \$10 per ton to work it, keeping what they can make above that figure. B. F. Leete has finished grading for his mill and a portion of the machinery is in place. He expects to have everything in running order in about 10 days. The mill will work about 10 tons per day. H. H. Robinson is having five tons of rich gold ore worked at the Stewart mill. It is expected that it will pan out big. Guy Thorpe has six men working. He shipped last week a test lot of a little more than three tons to be worked at the Douglass mill in Dayton.

#### Jackrabbit District.

**ORE BODY.**—*Pioche Record*, Sept. 15: Word reached town from Jackrabbit that it is believed that the miners have just encountered the ore body in the Onondaga mine. They have struck the outer edge of a body of solid carbonate ore, the extent of which it is unable to yet determine. The veins of ore are gradually drawing together. The main body cannot be far off. The work of next week will likely decide the matter. The first piece of the ore struck taken out, with its outside coating of lime on it, was sent to town and assayed over 41 ounces.

#### Pioche District.

**RICH ORE.**—*Pioche Record*, Sept. 15: The relocators of the Gray Eagle mine, well up on the side of the mountain above the Alps, and the claim out of which such rich ore and over which considerable fighting was done in days of yore, are extracting what looks to be rich ore. They found a little seam of ore in the side of the shaft about 15 feet below the surface, and following it in it keeps gradually widening and is liable to widen out sufficient to give the boys a stake. It is difficult to decide which, the prospector or the leacher, erects the most towering castle in the air. Of late several of the leachers in this neighborhood, after their cleanup, have postponed their tour to the Holy Land.

#### ARIZONA.

**CHERRY DISTRICT.**—*Prescott Courier*, Sept. 13: Jas. Allen has purchased the interest of Mr. Bonham in the B. S. B. mine, Cherry district. Mr. Smith (Yank) is the other owner. It is a gold mine, and considerable gold has been arastraed from it. It is opened to a depth of 75 feet. In the same district Hardy & Co. are drifting on the Etta mine at a depth of 100 feet. They have four feet of quartz, all of which is rich in gold. Campbell, Munds & Olden have got as high as \$700 per ton gold out of their extension of the Etta. Cherry district is about 30 miles east of Prescott, in the Black Hills.

**STONEWALL.**—*Silver Belt*, Sept. 14: All the lessees on the Stonewall claim at McMillen are doing well. J. K. Smith and Charlie Newton have taken out considerable rich ore, and Lewis and West, for the short time they have been at work, have a splendid showing and are getting out very rich ore. Jose Solis & Co. are also making good wages. The greatest strike, however, made in the Stonewall for a long time was the recent one by Meyers & Co. In a week they took out about five tons of ore, estimated to be worth \$6000 to \$8000.

**OLIVE CAMP.**—*Tucson Star*, Sept. 15: For some time past Pima mining district, some 20 miles south

of Tucson, has attracted considerable attention. There are over 100 men at work in this district and there is room for a good many more. The camp is supplied with splendid water, which is hauled every day by Mr. Brown from a canyon two miles from the camp. There are several claims being worked now, and newcomers are leasing some of the claims for a duration of six months, paying 15 to 20 per cent for the privilege. The old San Xavier mine has been shut down for a short time, but will resume operations very soon under the management of a new company, who contemplate building reduction works there for their own convenience, as they have about 20 carloads of ore which will pay if they have their own works, but not to ship as long as the freight rates are so very high. The shaft has been sunk 245 feet, and they have good water; then they have an incline of 175 feet. Dr. W. A. Clark has charge of the mines at present. The Olive was located and is worked now by Messrs. Frank Allison, Jas. K. Brown and S. B. Conley. They have shipped \$29,600 worth of ore from this claim within the past eight months. The Annie is owned by Messrs. J. K. Brown and O. J. Doyle, who are still working it with a force of six men. The shaft is down 119 feet; the ore averages 207 ounces. Messrs. Brown and Doyle have several mines leased on their claim which are paying well. The Matchless is owned by E. B. Gifford and Warren Allison, but has been leased to George Bogan and Mr. Curry. The shaft has been sunk 50 feet; the ore is very good, averaging about 150 ounces. The quality of the ore seems to improve as they go down. The Horse Shoe is leased by Johnnie Devine, J. B. Scott and Mr. Steratt. The shaft is down 55 feet. The ore averages 175 ounces. They have just received returns from their last shipment, which averaged 175 ounces. The Pioneer is owned by the Rusk Bros., but has been leased by W. S. Neville and Mr. Freese. The shaft is down 78 feet, and the ore averages about 153 ounces. The Pima is leased by Messrs. White and Kenglar. The shaft is down 56 feet, the ore averaging 100 ounces. They have over a carload on the dump now ready for shipment.

#### COLORADO.

**SALE OF THE WHALE.**—*La Plata Miner*, Sept. 11: Messrs. J. Downen and A. T. Grigg, on the 27th of July, 1885, leased and bonded the Whale lode from John and Michael O'Neill, the owners. The claim was nothing more than a favorable-looking prospect, but the men took hold and diligently prosecuted work in sinking a shaft and running tunnels, and taking out no ore except what was in the way of development and enough to pay the expenses as the work progressed. Up to date only 15 carloads have been shipped, of a gross value of \$11,250, but the mine is now in a magnificent condition and there is any quantity of ore in the drifts ready to be stoped out. The mine was bonded for the sum of \$7000, including the extension, which makes a claim of 3000 feet on the same vein. The lessees, still wishing to add more development to the property, concluded to sell an interest in order to obtain a deed to the property and continue the work, and on being offered \$10,000 for a one-third interest by Mr. E. K. Smith, accepted the offer. It will therefore be seen that in addition to placing the mine on a paying basis, in one year Messrs. Downen & Grigg have paid for the mine and have \$3000 spending money. The deed was made out to Mr. E. K. Smith on Saturday last, who gave his check for \$10,000, and the former lessees at once turned over \$7000 to the original owners, Messrs. John and Michael O'Neill. The new owners will let a contract at once for 400 feet of additional development, and commence the erection of buildings for the accommodation of the men. No ore will be stoped out until next season, when the mine will be worked for revenue.

#### IDAHO.

**FROM THE GOLD BELT.**—*Wood River Times*, Sept. 15: Wm. H. Atkinson came in to-day from the Gold Belt. He reports considerable activity there since Mr. Murphy bonded the Alaska, Jumbo, Tip-top, and other claims for sums aggregating \$120,000, and unless he greatly mistakes the signs of the times the Gold Belt will be, ere many months, much livelier than now, and employ a large number of men. The bond on the Alaska, etc., is to run 60 days only.

**RUMORED SALE OF THE MINNIE MOORE.**—It is rumored on the street that the Minnie Moore mine has again been sold, and to another English company. The price to be paid is stated at a round million dollars. This rumor may be true, and it may not be; but certain it is that, a few weeks ago, Mr. Carmichael, while in Salt Lake City, stated that a good offer had been made for the property. From all accounts, the Minnie Moore is well worth the sum above stated.

**FROM SMOKY.**—James M. Wilson came in yesterday from Smoky. He reports all the mines being worked as looking well, and says that the King of the West is proving quite as good as the Carrie Leonard, as it shows ore in every opening. It seems as if they can't run a drift anywhere in that ground without encountering ore, and as depth is attained it proves richer. Some of that brought out a few days ago carried native, ruby and wire silver, and must be worth \$300 per ton. In the Sunday mine, near the King, the vein has been cut and driven upon for some time. The vein matter is mixed with ore, and a paying deposit is evidently not very distant from the present workings. In the Hardscrabble, which adjoins the Sunday, the workings are following the ledge, but only bunches of black sulphuret ore are encountered.

**MINING SALE.**—*Chall's Messenger*, Sept. 15: C. L. Randall has sold to Morris Ennis, the transfer being completed yesterday, a one-half interest in the Japan mine and a one-eighth interest in the Big Stiff mine, both situated in Snow-slide gulch, and about a mile southwest of the town of Bayhorse. These mines are in a good locality and are considered to be valuable properties.

**CUSTER.**—John L. Tonkins, superintendent of the Custer Company's mines up to a recent date, came out from Custer on Thursday and departed Friday morning for San Francisco. From there he goes to Baker City, Oregon, to take charge of a gold mine. Mr. Tonkins informed us that, during his superintendence of the mines of the company in Custer, which has been most of the time for the past

six years, there has been extracted above \$3,500,000 worth of the precious metals—principally silver.

**THE CARBON CENTER DISTRICT.**—*Coeur d'Alene Record*, Sept. 15: Enough has been done this summer on the principal prospects in the vicinity of Carbon Center to justify the prediction that that section is destined to be one of the most productive in Coeur d'Alene. Gold, galena and lead have been found in large quantities and there is sure to be a boom there as soon as some enterprising company takes advantage of the first-class inducements offered for profitable investments. Two new locations were made a few days ago by Win Evans and Phil Markson. They are called the Merrimac and the Hattie and are located about three miles from Carbon Center on Beaver and Carbon creeks. The Tough Nut is showing up well and a solid five foot vein has been uncovered on the Sunset. Yesterday we secured from Mr. Markson per mission to publish the returns from four assays of ore from the latter, made by Mr. Bryant, of Wardner, assayer for the Helena Concentrating Company: No. 1, 58 per cent lead, 19½ ozs. silver; No. 2, 69½ per cent lead, 24 ozs. silver; No. 3, 42 per cent lead, 17 ozs. silver; No. 4, 55½ per cent lead, 31 ozs. silver. All show a trace of gold. The principal properties can be easily and economically worked. A little more development will entitle several of the most promising prospects to the name of mines.

#### NEW MEXICO.

**COONEY CAMP.**—*Silver City Enterprise*, Sept. 16: Reports from Cooney camp say that the excitement among mine-owners and the people generally continues to grow over the exceeding richness and extent of the great strike in the Peacock mine. Everybody is elated over the prospect—which is now assured—of a genuine, substantial boom during the fall and winter months, and there is every appearance of great future prosperity for the business and mining interests of the whole district. A new stimulus has been imparted to the work of prospecting, and a great deal of money and labor will doubtless be attracted to the Mogollons through the developments that must be destined to follow. The Peacock strike has settled all question as to the permanency of the veins and rich ore at depth in Cooney, and everybody feels encouraged to go ahead and open the splendid prospects that are so numerous there. The latest from the Peacock is to the effect that there is a six-foot width of very high-grade ore, showing sulphide and native silver in quantity. Several large pieces brought into town are both rich and rare, much of the silver appearing in white filmy crystals numerous scattered throughout the quartz. The chute producing this character of ore has gradually opened as sunk upon, and appearances warrant the assertion that it will develop into one of the largest and richest ore bodies in this Territory. In general characteristics it resembles the famous Silver King ore, of Arizona, the quartz having the same clear, unaltered appearance, and the wire silver being found permeating the cleavages. Peacock stock just now is high up among the "fancies" on the St. Louis board, and with the prospects for extra dividends will continue to stay there. A lot of the new ore has already been produced from the deep shaft, and daily additions are being made. It is sacked and stored in the mill until the return of Mr. Miller, the president of the company, from St. Louis.

**A MILL.**—A. H. Cadwell, one of the three owners of the silver Rain-in-the-Face mine, is in the city for the purpose of having a five-stamp mill hauled to his mine. He reports mining interests in his locality prospering. Dr. Davenport hopes soon to erect a five-stamp mill. The Carlisle Company have finished grading for another 20-stamp mill in addition to the 20 stamps now running. The new stamps will soon be in place. The Carlisle Company struck a fine body of water this summer while prospecting a large body of ore, and now have water sufficient for 100 stamps. The water seeped through a seamed rock when the latter was first uncovered, but now comes in a strong stream. Lumber for the new mill building is now arriving from California. The business is reported to be entirely satisfactory under Supt. Huntley.

**BIG STRIKE.**—*Socorro Bulletin*, Sept. 15: John A. Miller is now dumping \$500 to \$600 silver and 7-ounce gold mineral out of his Peacock mine, at Cooney district, this county. This ore body is located in the 90-foot winze of the tunnel which runs in on the vein. The ore body is continuous and full width of the 539 winze. We have been semi-officially informed that another smelter is to be erected in this city at once.

**THE COMSTOCK OF THE ORGANS.**—*Rio Grande Republican*, Sept. 14: The *Republican* is not given to booming the mines of Organ without there is something of stability upon which to base assertions, believing that a false statement works injury to any camp; but all reports from the Stephenson mine are of such a character and from such reliable sources that we gladly herald to the world the fact that the camp has one of the great mines of New Mexico opened and producing. A few months ago Messrs. Foy and Barlen secured a lease on the property and following up the development of some former leasers soon showed up a body of ore that rivals anything yet exposed in the mines of that locality. From a carload shipment made in August the returns were \$33. This ore was taken from a face 30 feet wide, with neither wall showing, and was shipped without sorting. We are informed that a streak of nearly solid galena six feet in width yields \$150 per ton in silver. The capacity of the mine is now about two carloads a day, and about one in every five would be high-grade ore. A shipment will be made the first of the week. The Stephenson is not isolated by any means, and there are any number of properties which will be now opened out, the owners only needing the encouragement of a producing and paying property to induce them to work their mines.

#### OREGON.

**QUARTZ AND PLACER.**—*Jacksonville Times*, Sept. 17: Smith & Lynch have finished a long ditch to their placer mines on Wagner creek. S. Oyster & Co. are reported as having struck very good prospects in their placer mines in the Steamboat district. M. Y. Drake, Patrick Ivory and Paul Laborne have located a promising quartz ledge in Sterling mountain district, to be known as the Queen mine. John

Meldrum, from Steamboat, informs us that mining is about ended there for the season, on account of the scarcity of water. From John and Ed. Swinden we learn that L. D. Brown's quartz mill has arrived at Gold Hill, and will soon be put in position on the site of the one until late'y in use. The engine and all the necessary machinery for Baunle, Klippel & Co.'s quartz mill have arrived, and it is expected that everything will be in running order in a few weeks. This is one of the best mills that has ever been put up on the northwest coast, and we hope that the enterprise will prove an entire success. The *Oregonian* of the 14th says: "Another quartz mill, engine and boiler, was shipped from Portland yesterday by L. D. Brown to his mines in southern Oregon. It is a five-stamp mill, the stamps weighing 800 pounds each, and it is furnished with all the latest improvements. The whole outfit was manufactured in Portland, and is claimed to be the best mill ever made in Oregon. When the mill is erected Mr. Brown will have altogether 10 stamps running on the Swinden ledge. Professor Clayton's process will be employed and silver plates will be used instead of copper."

#### UTAH.

**REVIEW.**—*Salt Lake Tribune*, Sept. 17: The week has been one of fair activity in mining circles, without any event of marked moment. The mines all through the mountains are producing well and the outlook is excellent; the only trouble is the money-handlers' bear raid on silver. With the white metal at even one dollar an ounce great relief would at once be felt throughout all the silver-mining regions, and a heavy element of prosperity infused into all business transactions. The receipts for the week ending September 15th, inclusive, were of the value of \$160,235.14, of which \$114,793.56 was in bullion and \$45,441.58 was in ore. For the previous week the receipts were \$126,750.15 in bullion, and \$71,223.43 in ore, a total of \$197,973.58. The product of the Ontario for the week was 18,997.50 ounces fine bullion and \$9573.91 from ore sales. The mill, after a thorough renovation, has started again on another long run. The Daly sent out during the week 14 bars of fine bullion, 19,210.26 ounces; and lot 72 of ore, \$5887.71. All goes well with this property. Base bullion receipts in this city for the week were of the value of \$13,100; fine bars, \$39,341.13. The Hanauer smelter made bullion to the value of \$22,690 during the week; the Germania, nine cars, \$15,901.80. Ore receipts during the week were \$13,581.81 by Wells, Fargo & Company; \$22,520 (including \$3400 Crescent, and \$7520 Queen of the Hills) by McCormick & Company; \$9339.77 by T. R. Jones & Company; and by the Union National Bank lots 686 to 690, inclusive, of Antelope and Prince of Wales ore, 203,064 pounds value not stated.

**TINTIC.**—*Salt Lake Tribune*, Sept. 18: Tintic has long been a good mining district. One of the first starts here was at Homansville, where 12 years ago a 10-stamp silver mill was erected. It has four pans and two settlers, and is capable of reducing 10 or 12 tons of hard ore per day, and more of softer varieties. It now belongs to the Tintic M. & M. Co., of which Alex. Graham is superintendent. They are now employed in reducing ore from the Northern Spy and such other milling ores as they can buy. After looking over this property, the writer went to the Northern Spy group, located way up in the hills near the summit, dividing the property from the Eureka district on one side and the Mammoth on the other. The Spy group is located far above the others named. The Northern Spy group consists of the Northern Spy, Carissa, Alabama, James Blaine, James Fisk, Ben Butler and Orton. The main work is on the Spy and Carissa, while the other claims are side claims for protection and working ground. All have been patented, and belong to Graham and two or three associates East. The Northern Spy was discovered in October, 1880, and has been developed by a tunnel on the vein 1200 on the first level, being 600 feet each way, and at a depth of 100 feet below grass roots. The vein averages from 12 to 15 feet in width. The property is so situated as to give ample dumpage and ore houses, while it provides with necessary buildings for the men, etc. The ore is somewhat peculiar, there being streaks of lead ore, then comes milling ore, and the ledge so changing in quality of ore as to require constant watchfulness and very frequent assays. Less than six years ago the present owners purchased the property for \$33,000, since which it has paid back the money and given some dividends. In that time it has produced over \$200,000 for its owners. At one time 800 tons of picked ore was sold, which netted, after paying treatment and freight, an average of over \$53 per ton. The vein is in lime, has good walls, almost perfectly vertical. The lead ores run high in silver, carrying but little copper, and go about 10 per cent the value of metal in gold. They once took out 800 tons of milling rock that averaged \$32 in gold, but the ore usually mills in gold and silver from \$25 up to \$65 per ton. The ledge bears northeast and southwest. The Swansea, near Silver City, owned by Ritter, Elmer, Paxman and Hatfield, is being worked under lease by the last two named, who are making something above wages while developing the property. The Iron mines, which once shipped such large quantities of fluxing ore, are sending out about 1000 tons per month. The Ketchum (Idaho) smelter has been getting about 250 tons per month since the first of July. The Mammoth is doing nicely under the superintendence of Major A. B. Litchfield. The works at Tintic failed in the late experiment to make a success in the reduction of these ores. Major Litchfield took charge of the mine April 12th last. Samuel McIntyre has the general management of the Mammoth property, while Major Litchfield manages the mining. The mine has reached a depth of 675 feet, from the first level, which taps the mine at a depth of 600 feet. It has a fair hoisting works. A new boiler is being put in to enable them to make more steam. While this is being done the force of miners is 25 or 30, and will soon be increased to 65 or 70. The vein is an immense one, being 75 or 80 feet wide—an immense blow-out, in which are three well-defined pipes carrying pay ore, chiefly copper, and which averages about \$60 per ton. These pipes are at an angle with the trend of the vein, of about 45 degrees. These are surrounded with quartz, carrying little or no copper, but \$10 to \$25 in silver and gold. Large quantities of \$60 copper ore are being sent to Colorado, and \$25 milling ore is also being shipped.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or  
 other Mineral Substance to any degree of fine-  
 ness in a rapid and economical manner.

Any method of amalgamation may be applied.  
 At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh  
 dry, and from 3000 to 6000 pounds wet.  
 All wearing parts easily and cheaply replaced. May be seen in operation at the New York  
 Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.  
 Certificates as to performance of the Mills, and any information required, furnished on  
 application.

## THE FRISBEE-LUCOP MILL CO.,

## Mechanics' Fair Prizes.

## Award of Gold and Silver Medals.

As the Mechanics' Institute Fair closes this week, the public will be interested in knowing who the fortunate winners of the gold and silver medals were. We therefore publish the annexed list:

## Gold Medals.

W. H. Ohmen, best automatic cut-off steam engine.  
Dow Steam Pump Works, for best steam pump, Pacific Coast manufacture.  
Baker & Hamilton, best display of agricultural implements.  
California Wire Works, best display of cactus barbed wire.  
George H. Tay & Co., best display home manufacture stoves and ranges.  
Hall's Safe and Lock Company, for fire and burglar-proof safes.  
Weed & Kingwell, for brass and plumbers' work.  
John Mallon, for art-stained glasswork.  
David Kerr, best two-horse truck.  
A. Folsom & Son, for best display of vehicles.  
Kreling & Son, general display of furniture.  
H. Liebes & Co., for fur goods.  
California Cotton Mills, for manufactured cotton goods.  
Pioneer Woolen Mills, for blankets, flannels, etc.  
Redington & Co., chemical and pharmaceutical goods, home manufacture.  
J. Gundlach & Co., California wines and brandies.

## Grand Silver Medals.

San Francisco Tool Company, machinists' tools.  
S. B. Page & Co., best rock-breaker.  
G. & E. Pennington & Sons, home manufacture, tool steel bars.  
P. Liesenfeld, best display of billiard tables and fixings.  
Carlson & Currier, silk thread and twist, Pacific Coast manufacture.  
Giant Powder Company, for giant powder.  
J. Roach, mathematicians' and surveyors' instruments.  
California Electric Light Company, for electric lights and dynamos.  
Electrical Supply Company, for electrical regulators.  
Standard Soap Company, for all exhibits.  
Class 16—Will & Fink, best carving set, Pacific Coast manufacture.  
Class 17—B. Nathan & Co., display of cut table glass, porcelain and fancy ware.  
Class 20—Kohler & Chase, display of pianos, Pacific Coast manufacture.  
Class 45—Jones & Lotz, best general display of photographs.

## Silver Medals.

Union Iron Works, superior workmanship and automatic cut-off engine.  
Byron Jackson, automatic cut-off engine.  
A. W. Bull, best portable engine for general use.  
George Cummings & Co., for sectional forge and hand-blower.  
John Simonds, best general display of saws.  
Pacific Manufacturing Company, windmill working model.  
Palmer & Rey, best general display of printing machinery.  
Constant Auger, for miniature working steam engine.  
E. G. Damiston, for amalgamating plates.  
W. I. Tustin, for Tustin's rotary pulverizing mill.  
Pacific Coast Vacuum Furnace Co., for vacuum furnace and smoke consumer.  
W. T. Y. Schenck, for cotton hose and hose reels.  
L. A. Owen, for steamboat and yacht models.  
John Olsen, for model of full-rigged ship.  
California Silk Culture Association, for silk-reeling machine.  
J. L. Hicks, New York and Helpmate sewing machine.  
H. C. Fiske & Co., best display of sewing machines.  
Baker & Hamilton, "Perfect" gang plow.  
More Bros., for Buckeye binder.  
Hawley Bros. Hardware Co., Buckeye mower with self-rocker.  
Baker & Hamilton, Benicia ditching plow.  
Goldian Nut Lock Association, for Goldian nut locks.  
A. G. Kittredge, for ornamental wrought-iron work.  
A. F. Meyer & Co., for gas stoves.  
Baker & Hamilton, combined header and thrasher.  
Liddle & Kaeding, for display of fishing tackle.  
H. B. Cook, for Cook's biceptor.  
Mighells & Richards, best fire-proof safes.  
Frank A. Davis, for cutting dies.  
Will & Finck, best display of cutlery.  
S. G. Williams & Sons, for mantel grates.  
Ackerman Bros., display of cut glass and fancy ware.  
Sanitary Plumbing Manufacturing Co., automatic water-closet.  
A. S. Graff, display of California-made lamps.  
John Mallon, for ornamental cut and bent glass.  
Conover Piano, for excellence of structure, action and tone.  
Fred Trebert, for hand-carved objects.  
Kohler & Chase, brass wind instruments.  
Thomas Bree, display of banjos.  
Studebaker Bros. Manufacturing Company, display of carriages and buggies, two medals.  
E. W. Shaw, for best open buggy and for top buggy, three medals.  
McCue Carriage Company, for best Victoria top rockaway and hearse.  
Heywood Bros. & Co., best display of willow-ware furniture, two medals.  
Chadbourne & Co., for parlor set and upholstery.  
Pacific Spring and Mattress Company, for folding lounge.  
S. W. Clark, for decorative wall hangings.  
Jos. Fredericks & Co., for bedroom furniture.  
Korbel Bros., for wine tank.  
Dr. W. S. Halpruner, for anatomical lasts.  
L. T. Koesel, best display of trunks and bags.

Mrs. J. T. Terry, modeling in plaster.  
T. R. Southern, general display of drawing.  
Students of St. Mary's College, best specimen of penmanship.  
A. P. Flaglor, retouched photographs.  
Bertha Christian, best colored photographs.  
Charles Lanier, best photographs finished in crayon.  
Charles Lanier, finished cabinet photographs.  
Henry C. Owens, display of amateur photographs.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$21.80 @ 22.15; Billiton Tin, \$21.90 @ 22.25; Banca Tin, \$22.05 @ 22.40; Baltimore Copper, \$9.25 @ 9.60; Orford Copper, \$9.75 @ 10.00; P. S. C. Copper, \$9.35 @ 9.65; Foreign Lead, \$4.85 @ 4.90; Foreign Spelter, \$4.70 @ 4.75.  
MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge, \$15.00 @ 16.00. Hudson River, Grade No. 1, \$18 @ 18.50; No. 2, \$17.00 @ 17.50; Grey Forge, \$15.00 @ 16.00. Southern, Grade No. 1, \$17.00 @ 18.50; No. 2, \$16.50 @ 17.50; Grey Forge, \$15 @ 16.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

DUFFY WAVE MOTOR Co., Sept. 16.—Objects are to utilize the ocean and other bodies of water as a motive power and to furnish the city and county of San Francisco with power, light, heat, compressed air and salt water; to buy, sell and manufacture all material relating to supplying power, heat and light, compressed air and salt water. Capital stock, \$1,000,000, in 10 shares. Directors—Terrence Duffy, Chauncy Park, W. A. Williams, John Belter and Michael Brown.

MILLIKEN TRACTION ENGINE Co., Sept. 17.—Object, to manufacture traction engines and all forms of agricultural, mining and milling machinery. Capital stock, \$300,000, in 80,000 shares. Directors—W. H. Milliken, A. J. Bryant, P. L. Weaver, G. G. Francis and W. H. Knight.

JOHN T. CUTTING Co., Sept. 18.—Object, to buy and sell real estate, and pack vegetables, fruit and fish. Capital stock, \$100,000, in 1000 shares. Directors—John T. Cutting, C. T. Knudsen, T. W. Collins, L. W. Bartell and C. Q. McDonough.

EMPIRE G. M. Co., Sept. 21.—Capital stock, \$1,000,000. Directors—M. A. Shepherd, W. R. Judson, A. Judson, E. Green and J. H. Oliver.

ODORLESS APPARATUS Co., Sept. 20.—Object, to carry on and manage in Australia, Japan and the Republic of Mexico the business of excavating vaults, sewers, wells and cesspools, etc. Capital stock, \$2,500,000, in 550 shares. Directors—A. K. Coney, W. T. Humphreys, G. J. Carpenter, Geo. W. Corbell and T. H. Reynolds.

THE HISTORY Co., Sept. 20.—Object, to manufacture and sell the historical works of H. H. Bancroft, to publish and sell other books, maps, etc., and to carry on a stationery and book business. Capital stock is \$500,000, in 10,000 shares. Directors—H. H. Bancroft, N. J. Stone, O. A. Stone, M. G. Bancroft, K. K. Bancroft.

INYO MARBLE Co., Sept. 20.—Capital stock, \$1,000,000, in 100,000 shares. Object, to quarry marble in Inyo county, Cal. Directors—Israel Luce, J. M. Keeler, H. B. Keesing, Samuel Keesing, F. Heller, Jr., J. P. Fraser and G. W. Luce.

## Mining Share Market.

The Justice mine, on the Comstock, now starting up, has been idle for the past five years. The movement in Alta, which adjoins it on the south, has probably caused this resumption of operations. Alta is the only one of the line that has shown any activity of late. Work is resumed in the Crown Point and Belcher mines, the cooler weather and consequent decreased evaporation having allowed the mountain springs to rise and induced a corresponding increase of water in the river, allowing of a partial resumption of work for the mill stamps, which were hung up. Only about half the number of miners required by full work have been put into the mines, although more will be if required. There is little to be said in the matter of news in the middle mines. The water is all out, and further explorations of the lower levels are being proceeded with in Hale and Norcross and Chollar. Ore developments are being proceeded with satisfactorily in Savage, and at the Osbiston shaft preparations are being made for sinking a large three-compartment winze below the old southwest drift on the 2500 level, in Gould & Curry ground. A better grade of ore is being extracted from the lower levels of the Consolidated California and Virginia than heretofore, as shown by the average assays and solid bullion results.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Navajo, September 15, \$10,000; Moulton, 14, \$13,160; Oro Grande, 12, \$4269; Barber's Mill, 12, \$1800; Navajo, 17, \$8500; Germania, 16, \$3558; Queen of the Hills, 16, \$1650; Nevada, 16, \$2500; Hanauer, 16, \$2080; Germania 17, \$1702; Stormont, 17, \$3130; Queen of the Hills, 17, \$1650; Alice, 12, \$21,260. Wells, Fargo & Co., of Salt Lake, shipped for week ending Sept. 15, in bullion, \$66,022; McCormick & Co., \$47,710; T. R. Jones & Co., \$25,241; Union National Bank, \$21,260; Moulton, 18, \$12,976; Hanauer, 14, \$2048. The banks of Salt Lake City report the receipt for the week ending Sept. 15, inclusive, of \$160,235.14, of which \$114,793.56 was bullion and \$45,441.58 was ore. Last week's bullion and ore output was: 22 cars bullion, 534,862 lbs; 15 cars lead ore, 542,930 lbs.; 4 cars copper ore, 115,550 lbs.; total, 41 cars, 1,193,342 lbs.

## List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 14, 1886.

- 349,075.—ORANGE PEEL SEPARATING AND SHREDDING MACHINE—Barnard & Benedict, Los Angeles, Cal.  
 349,080.—HORSESHOE—J. E. Bingham, Walla Walla, W. T.  
 349,081.—HORSESHOE—J. E. Bingham, Walla Walla, W. T.  
 349,082.—HEADLIGHT LAMP—E. Boesch, S. F.  
 349,088.—BRIDLE BIT—Geo. A. Doherty, Crescent Mills, Cal.  
 348,956.—WORKING SHIPS' PUMPS—E. Everding, Eureka, Cal.  
 349,110.—LAMP BURNER—C. H. Maisch, Carson, Nevada.  
 349,051.—PREVENTING OBSTRUCTION OF STREETS AT FIRES—J. R. Meyers, S. F.  
 348,993.—RENDERING FIBER WATER-PROOF—Pearce & Beardsley, S. F.  
 348,994.—INSULATING WIRE FOR ELECTRICAL PURPOSES—Pearce & Beardsley, S. F.  
 348,995.—PAPER AND PRODUCTS—Pearce & Beardsley, S. F.  
 348,996.—ROOFING FABRIC—Pearce & Beardsley, S. F.  
 349,058.—CONCRETE MOLD FOR WELLS, ETC.—E. L. Ransome, S. F.  
 349,181.—FEED-WATER PURIFIER—W. J. Smith, S. F.  
 349,066.—TREE COVER—J. Stahl, S. F.  
 349,071.—HEEL DIE—W. Watson, Victoria, B. C.  
 349,192.—WELL-BORING TOOL—J. A. Woodhouse, Santa Ana, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
 G. W. INGALLS—Arizona.  
 E. L. RICHARDS—San Diego Co.  
 R. G. HUSTON—Montana.  
 GEO. McDOWELL—Santa Clara Co.  
 FRANK W. SMITH—Utah and Colorado.  
 M. S. PRIME—Marin Co.  
 W. J. TULLIS—Humboldt Co.

## Acid-Proof Paint.

Among the meritorious exhibits at the Mechanics' Fair, to which was awarded a Silver Medal, is the display by the Paraffine Paint Company, whose main office is at 310 California street. The property which this paint possesses of resisting acids and chlorine gas, as well as defying the effect of long submersion in water, makes it of particular value in gold mills using the chlorine gas process, the tanks containing the solution being rendered watertight and impervious to the acid by its use.

After being subjected to a severe test it has been adopted, among other places, at the Amador Reduction Works at Sutter Creek, and the Phoenix works at Drytown, Cal., where a variety of substances, such as tar, asphaltum, pitch, white lead, black varnish and other materials, had been used without success. This paint is also used extensively in woolen mills for coating tanks, iron pipes and other surfaces in contact with sulphuric and muriatic acids, against the injurious effect of which it has been found to afford complete protection.

S. WENBAN has shipped from Beowawe eight bars of bullion, valued at \$8000, from his mine at Cortez, Nev. This bullion was produced by the leaching process.

## ASSESSMENT NOTICE.

**Truckee Ice Company.**—Location of principal place of business, San Francisco, California. Location of works, Martus Creek, near Truckee, Nevada county, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 1st day of September, 1886, an assessment (No. 1) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 202 Sansome Street, room 4, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 25th day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. W. SCOTT, Secretary.  
 Office—No. 202 Sansome St., room 4, San Francisco, California.

## WANTED!

Man of Capital and Mining Experience to buy a number of claims, all in the hands of prospectors. Three Locations on same vein, 10-25 feet; formation, slate hanging, granite footwall; assays from \$10 to \$90 per ton in gold and silver, with a little copper in it. Can be opened and worked with tunnels to a depth from 400 to 2000 feet. Plenty of water and densely timbered. Title perfect. About 20 miles from N. P. R., Montana. No Reduction Works in the vicinity. Will bear close investigation. Great chance for practical mining men of some means. Price, \$30,000. For further particulars, address

J. W. LIND,  
 Marysville, Lewis & Clarke Co., Montana.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdies, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

THE GUTTA PERCHA AND RUBBER MANUFACTURING CO.  
—MANUFACTURERS OF—  
**RUBBER GOODS.**

Patentees of the Celebrated "MALTESE CROSS" Brand Carbolized Hose.

The Best Belting for Threshing Machines is our **MONARCH RUBBER BELTING**, made with Cotton Stays or Flexible Rivets.

We have also the Patent **RED STRIP Rubber Belting**, and our Superior **STANDARD Rubber Belting**. Send for Price List of kind wanted.

JAMES F. HOUGH, General Manager of San Francisco and Portland, Or., Branches 15 and 17 FIRST ST., near Market, SAN FRANCISCO, CAL.

THE  
IMPROVED  
FORM  
—OF—  
SINGLE-JOINTED

**HYDRAULIC GIANTS.**

We are now in the field as manufacturers of SINGLE-JOINTED HYDRAULIC GIANTS, and are prepared to furnish the several sizes with quick dispatch, and they will be found to be the equal of, if not superior to, a similar form ordinarily known as the Marysville Nozzle, and will quote prices upon application.

**JOSHUA HENDY MACHINE WORKS,**

Nos. 39 to 51 FREMONT ST., SAN FRANCISCO, CAL.

This cut represents our  
IMPROVED  
HYDRAULIC  
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.  
**HOSKIN & CO., Marysville, Cal.**

**IMPROVED FORM OF HYDRAULIC GIANTS.**

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

Send for Circular.**REGISTRATION**

—FOR THE—

**General Election.**

All electors desiring to vote at the General Election, to be held November 2, 1886, must be registered regardless of any previous registration.

Registration for the General Election to be held November 2, 1886, will commence at the office of the Registrar of Voters, in the basement of New City Hall, on WEDNESDAY, August 4th, and will continue until MONDAY, October 11th, inclusive. Office hours, 9 o'clock A. M. to 5 P. M.

By order of the Board of Election Commissioners.

P. F. WALSH, Registrar.

August 1, 1886.

**American Exchange Hotel,**

SANSOME STREET.

Opposite Wells, Fargo & Co.'s Express, one door from Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

**Board and Room, \$1.00, \$1.25 and \$1.50**  
 PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

MONTGOMERY BROS., Proprietors.

**Dewey & Co.'s Scientific Press**  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

No. 252 Market St. Elevator 12 Front St.  
 S. F. Telephone No. 658.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

**ORE FEEDERS.**

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,  
 AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ore to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will slice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,  
 (Signed) N. W. CROCKER, Supt.

W. E. CHAMBERLAIN, JR. T. A. ROBINSON.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers.

**LIFE SCHOLARSHIPS.....\$75.**

Ladies admitted into all departments. Day and Evening Sessions during the entire year.  
 Call, or send for CIRCULAR to  
 CHAMBERLAIN & ROBINSON, Prop's.

**QUARTZ BREAKERS!**

—AND—

**Pulverizers Combined.**

To Run by Hand or Power.  
 Mining Machinery of Every Description; Drawings, Plans and Specifications.

E. J. NICHOLS, 316 Mission Street, S. F.

**RUPTURE!**

A New Invention! The "Perfection" Belt Truss, with Universal Joint Movement and Self-adjusting Spiral Spring. Worn with perfect comfort night and day. Gives universal satisfaction. Price, from \$3 to \$6. Call or send for descriptive circular. Address, J. H. WIDDER, (Druggist) 701 Market Street, cor. Third, San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

SAN FRANCISCO, CAL.

THE ORIGINAL  
**Roller Ore Feeder.**

This form of Ore Feeder is well adapted  
for its peculiar work.

In reference to a similar form of "Roller" Feeder,  
which is being manufactured and offered for sale in this  
city, and of which a cut appears in this journal, we have  
to say that the Superintendent of the Bunker Hill Gold  
Mining Company states that the "Challenge" is far su-  
perior to the "Roller," he having had both of them  
operating side by side. We shall be pleased to show this  
letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and  
"Stanford Improved."

Prices furnished by the

chinist.**

A variety of good Tools, Patterns, etc., with business  
for sale cheap by a party retiring from business. A  
splendid opportunity for an enterprising mechanic.

Address A. B. O., care of this paper.

**HOOD'S FOUNDRY COKE.**

Consumers are respectfully informed that owing to inferior brands of Coke having been sold  
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.  
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting  
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,  
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded  
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-  
ties to suit purchasers.

**THE ROLLER ORE FEEDER**

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.  
It has fewer parts, requires less power, is simpler in  
adjustment than any other. Feeds coarse ore or soft clay  
alike uniformly, under one or all the stamps in a battery  
as required.

In the Bunker Hill Mill it has run continuously for two  
years, never having been out of order or costing a dollar  
or repairs.

Of all kinds made to order. Send for Descriptive Cata-

logue. 17 and 19 Fremont St., San Francisco.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.**  
(\$575 00), F. O. B.

**OVER 1,000 ARE NOW IN USE.** Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1888. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.  
**RANKIN, BRAYTON & CO.,**  
...BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

**BAKER'S MINING HORSE POWER.**

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Entirely Prevents Lead Poisoning  
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

T. E. JEWELL, Sole Agent,  
330 Pine St. (Room 4) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

## Concentration of Iron Ores.

In the MINING AND SCIENTIFIC PRESS of August 14th we gave an engraving of a jig used for concentrating iron ores, and promised to give a description of a whole plant for this purpose put up by Arthur F. Wendt at the Crown Point mines, New York. That plant is nearly a counterpart of that since erected by Messrs. Copeland and Bacon, contractors, for the Theal mine, Putnam county, New York, which is illustrated by the accompanying plate. The only difference is in the support of the crush-

until it is delivered, free from adhering gangue, in any chosen receptacle, no manual labor whatever is employed.

The practical results of the Crown Point plant are as follows: Ore treated in 10 hours, 80 tons; percentage yield of ore in concentrations, 28 per cent; average per cent of iron in concentrations, 65 per cent.

The power required is about 40-horse power, and at Crown Point, where, for the major portion of the year, this power is furnished by water, the cost is considerably less than \$1 per ton of dressed ore. A curious feature of the

## Utilization of Ozocerite.

Ozocerite is a mineral wax or native paraffine, rather scarce and found only in few localities. It usually occurs in beds of coal or associated bituminous substances. It is like wax or spermaceti in appearance and consistency, ranging in color from an impure white to black, but is frequently brown or green.

Some years since a deposit of this substance was discovered in Southern Utah—the only place in this country, as far as we know, where it has been found. It was considered so valuable

like railroad ties. Notwithstanding the high temperature, which reaches 140° F., the ties retain their shape and hardness. These asphalt ties are used all along the road, except at the ends and center of every rail, where, as yet, wooden ties are employed. In this way about \$800 a mile is economized.

THE regular annual meeting of the Anti-Debris Association was held at Yuba City Saturday. Reports of the work accomplished during the past year were rendered, and an outline made of the work yet to be done. The expenses for

WORKS FOR THE CONCENTRATION OF IRON ORES AT THE THEAL MINE.

ers. At Crown Point this support is a wooden tower; at the Theal mine, masonry foundations are used.

By reference to the plate, the whole construction will be readily understood. Raw ore is dumped on the upper floor by an automatic skip. It is fed by hand into the 9x15-inch crusher, and thence passes by gravity through a 6x20-inch crusher, 16x36-inch rolls, and 12 by 24-inch rolls.

The whole operation is automatic. Screens are inserted between the different crushing machines, to remove any ore that will pass through a  $\frac{1}{2}$ -inch mesh. The screens also serve to feed the various machines regularly, thus contributing, in a measure, to the rapid crushing.

A bucket elevator raises the crushed ore to the sizing screen, where grading into two sizes is effected. The coarse ore from  $\frac{1}{2}$  inch to 1-16 inch in diameter is fed automatically to four jigs. The fine ore is fed to two jigs. From the moment the ore enters the large initial crusher

jigging is the elimination of phosphorus. At Crown Point this is not very marked, because the raw ore is extremely low in that impurity; but at the Theal works the results are striking. Thus, concentrations and tailings contained by analysis, respectively, .18 and .297 per cent of phosphorus. Again, an average of a lot of raw rock showed .18 per cent, and the concentrations therefrom .08 per cent of phosphorus. This is practically converting a non-Bessemer into a Bessemer ore.

It might be doubted whether this process could be applied to iron ores other than magnetites, in which the ore occurs in grains of considerable size; but Mr. Wendt states that experiments have proved that there is no difficulty whatever with specular ores, although the degree of concentration is not equal to that of magnetites.

THE cars for the electric road have arrived at Los Angeles.

that a Boston company was formed to work the deposit, which has since been mined extensively and to some profit. Samples analyzed in this city were found to contain a large percentage of white wax of the kind used in making paraffine candles.

A new and important application of ozocerite has been recently discovered in Russia. It is now used for making ties on the Transcaspian railroad, which has already passed Oschabat and nearly reached Merv. The process of manufacture is very simple and inexpensive. Kyra, the local name for ozocerite, is found there in thin layers of seven-inch thickness. In its primitive state it contains a certain percentage of decayed matter. To remove this, the ozocerite is melted in large caldrons; the refuse sinks to the bottom and the pure ozocerite collects at the top. This purified ozocerite, melted and mixed with 75 per cent of limestone and 25 per cent of fine gravel, gives a very good asphalt, which is pressed in boxes shaped

the past year were \$21,062, sixty-two dollars in excess of the receipts. George Ohleyer, B. F. Walton, C. K. Dam, C. E. Saxey and B. D. Grey, all members of the old Board, except the last named, were elected directors for the ensuing year.

THE stockholders of the Portland Reduction Works have formed a permanent organization, as follows: President, W. S. Ladd; Vice-President, W. A. Jones; Treasurer, James Steel; Secretary, J. M. Arthur. Board of Directors—W. S. Ladd, S. G. Reed, James Steel, W. A. Jones, Charles F. Powell, C. H. Prescott and F. J. Cavell. The buildings of the company in East Portland are rapidly approaching completion.

THE Peerless Mining Company has been sued by John Keegan, who seeks to recover \$400 on four orders of \$100 each, executed in his favor by the mining company, and which Keegan alleges they now refuse to pay.

## Earthquakes.

## Can Predictions be Made?

EDITORS PRESS:—Prof. John Milne says: "How to predict earthquakes and how to escape from their dangers are problems which, if they can be solved, are of extreme interest to the world at large."

The recent calamity that has befallen Charleston will doubtless direct the attention of Americans, and especially scientists, to unfold the laws of earthquakes more than they have ever done before. Prof. Milne, of Japan, has well explained the various instruments in use for determining the force and direction of the source of earthquakes, etc., and probably many of the philosophers in every civilized country are as familiar with the several seats of disturbance which induce earthquakes within specified ranges, as astronomers are with the grouping of the celestial constellations. But, while undoubtedly a large number of earthquakes may be so classified, like wheels within wheels, yet there are many others of such colossal extent that they would appear almost to overcome every seemingly natural barrier. Neither the breadth nor the depth of the Atlantic ocean—with all its innumerable deep-sunk, but, in fact, highly elevated ridges and reefs of rocks overflowed for many thousands of feet above by the ocean currents—forms any insurmountable obstacle to the same seismic influence felt from Greece in the Mediterranean sea to Charleston on the shores of the Atlantic; or Japanese, or even Javanese earthquakes, being felt right across the immense basin of the Pacific ocean and the South American coast, or perhaps in California. Yet perhaps the same law that holds in Japan—that an eastern earthquake does not usually cross the range of mountains to its western shores—may hold on the continent of America.

An earthquake originating in mid-ocean, or in Europe, although it may carry destruction to Charleston, would never be likely to cross the Rocky mountains to the Pacific Coast, nor would a Pacific ocean earthquake, although its effects extended to the Pacific Coast, cross the dividing ridge which separates the West from the East on our continent. It would, however, almost seem that it should be an axiom that no earthquake could be felt over a greater extent than 180°. In such case the center of disturbance would be the center of the globe, while if the extent was only 90° the depth of the disturbance could only be the sine of the chord of that arc.

And so with every extent of arc of the earth's surface, found to be the extreme limit of the tremor; it would then hold that the sine of the chord of the arc must be the disturbing center. The first point to ascertain, therefore, would be the extreme limits of shock, and next, from the center of such arc, on the earth's surface, find what the vertical sine would be that would cut such chord of arc. The rule for finding the source of any earthquake would be very simple if we can arrive at that conclusion—and why not? And it also leads us to several other interesting conclusions. For instance, supposing it is ascertained that the extreme limits of the Charleston earthquake were from about 45° east of Greenwich to 90° west of Greenwich, or 135° in extent; then we should say that the center of disturbance was below 22° 30' west longitude from Greenwich, at a depth of very nearly one-third of the whole diameter of the earth, or more than 2500 miles below the surface of the ocean. Then if we call Charleston about 80° west longitude from Greenwich, the earthquake must have lost in intensity in the proportion of 57½° out of 67½°, the extreme limits from the center, or nearly six-sevenths; or, in other words, the disturbance at Charleston may have been only one-seventh of what it was at west longitude 22° 30'; and on the other hand, if the disturbance in Greece was in east longitude 22.30° or thereabouts, making only 45° east from the great center of disturbance, it was probably at least one-fifth the greater in intensity in Greece than at Charleston.

But we should naturally look for the greatest disturbance at the Azores, or Western Islands, and St. Michaels, or in the longitude of about 20° and 25° west of Greenwich. Now, that, according to the story of Atlantis, has been one of the greatest scenes of disturbance on the face of the earth, when we consider that the Azores are now only the mountain peaks of a sunken continent of 2000 or 3000 miles in length and 1000 miles in width. The same mighty power that buried it in the depths of the ocean can, of course, uplift it again, in due time, if it is so ordered; and at all times it will be deeply interesting to take record of any changes that may occur in that land of the earliest mythologies of which we have any trace.

The question of the possibility of the prediction of earthquakes is a very interesting one, and not at all ignored by Professor John Milne. It is manifest that there is no effect without a cause, and as scientists become familiar with the extent and consequent sources of earthquakes, so such occurrences lead to consideration of what may occur within comparatively short periods. Mr. Wiggins, of Canada, is said to have predicted the Charleston earthquake some

18 months since, to occur when and where it did—about August 31st last. My impression is that he published a pamphlet which many newspapers called attention to, and ridiculed; but if these predictions have been verified, scientists cannot now ignore them, and the line of argument should be critically and carefully examined which has led to such remarkable results.

The stepping-stones to discovery have in all ages had to overcome much skepticism. In the 19th century, therefore, we should be rather indulgent to receive patiently and impartially any reasonably stated evidence that has for its sole object the advancement of science. It may help us greatly in a path that may seem otherwise deviant and impracticable to advance in, and enable us to arrive at conclusions that may be of signal benefit. Surely, if a full inquiry had been made 18 months ago into Mr. Wiggins' theories in support of the prediction of the recent earthquake at Charleston, some steps might have been taken to have rendered the city or the buildings more secure. San Francisco long ago took warning and has numerous earthquake-proof buildings, sufficient at least for ordinary liabilities, and wherever and whenever science points to probable future dangers on this coast or elsewhere, from earthquakes, all the provision that man can make to avert the worst consequences of such calamities should be put in hand in due time.

Mr. Wiggins should be invited, therefore, to present his views in detail, with suitable diagrams to illustrate the whole matter, before a Government-appointed board of scientists, that due inquiry may be instituted, and if Mr. Wiggins should not yet be exactly on the right track, still such an inquiry, earnestly followed up in good faith, would certainly lead to sound conclusions and may be fraught with almost incalculable benefit to ourselves and coming generations.

A. F. G.

## Floating Mines in London.

## American Mines Abroad.

EDITORS PRESS:—It occurs to me that a short letter from London, giving a fair statement of the business outlook here from a mining standpoint, may not be unacceptable, and with this idea in view I send you the following:

A leading London financial paper recently said: "The United States, with an acreage of farm lands under cultivation equal in extent to all of the United Kingdom of Great Britain and Ireland, France, Belgium, Portugal, Germany and Austro-Hungary, still, *mirabile dictu*, our American friends cannot build 100 miles of railroad without coming to London for the money to build it with." And apparently this assertion is equally applicable to the mine-owners in the United States as well as those in the balance of the world. London is certainly the financial hub of the universe, and the balance of creation revolves about it and toward it, and to it, and as the London markets go so goes the world. Hardly a day passes without witnessing the advent of a new mining company. Last week there was one from North Carolina, one from Idaho, two from South Africa and one from India, launched upon this market. Some are successes, but the majority are failures. Of the latter the world never hears after the first attempt to float them, yet when there is a successful company it is so well advertised, so much talked of and written about, that the dear public take it for granted that gold mines—everything is gold mines just now—are all good, and 9 times out of 10 bite at the next tempting bait thrown to them.

## The Method of Floating a Company in London

Is unique as compared to the U. S. methods. I'll describe it. The vender consults a broker and presents his papers, reports and samples; the titles and reports must be in good shape and approved by some firm of solicitors and a mining engineer favorably known to the investing public of London, or else the broker will not consider them; this ordeal successfully passed, the vender names his price, which may be all cash or partly cash and partly a stock consideration; this agreed upon, the broker prepares to bring out the company. The first step in this operation is to secure a chairman for the board of directors; nobody untitled will answer for this office, and the broker tries the entire list if he is not at first successful. Dukes, earls, marquises, viscounts, lords, baronets; he doesn't want an earl if he can get a duke, and so down to a sir, which latter he is mostly obliged to accept; the chairman secured, the remainder of the board is made up of business men, naval and military officers, members of parliament, etc. Upon the social standing of the board, solely depends the success of the scheme, and if it is headed by a duke or earl—a very rare occurrence—the stock is sure to go off quickly and at par. I must not forget to mention the fact, for it is an important consideration, that the services of the board have been secured for a certain block of full paid shares, the size of the block varying and dependent upon a variety of circumstances, but under the most favorable auspices the allowance is always liberal; this is distributed where it will do the most good, and then a day is set for

## "Bringing Out" the Company.

This operation is a simple, but not an inexpensive, one. The *modus operandi* is to advertise in every daily paper in London an abridg-

ment of the prospectus of the proposed company, and this advertisement occupies from a column to half a page of space; hence it is obvious that in newspapers with a daily circulation of from a quarter to half a million copies, such a "card" will cost (as they say in England) "a lot of money." These advertisements are usually worded in this style (I quote from a current prospectus): "Capital, £85,000 in 17,000 shares of £5 each; 11,500 shares are offered for public subscription. Payments, 10 shillings on application, £1 10s on allotment, £1 one month after allotment, and £2 two months after allotment, etc." If the public comes forward and subscribes for the stated number of shares, it is then said to "go," otherwise it is either a failure or else the unsubscribed stock is underwritten, i. e., taken by the promoters—vender and Board of Directors.

This is all very quickly explained on paper, but it is quite a different matter to float a company. If the mine is a "going concern," that is, if it is being successfully operated and is paying moderately well, it is a comparatively easy matter to get it sold at a fair price; but, on the contrary, if it is an idle property, whether from inherent worthlessness or from lack of means on the part of the owners, it is next to an impossibility to get a good broker to touch it. I know men in London who have been here two and three years trying to place mines, but because they are not "going concerns," they have been unable to accomplish their object, and they are liable in the end to return to the United States both wiser and poorer. There is every indication of a

## Mining Boom for this Coming Season.

And if the signs do not fail, rich harvests will be reaped by the fortunate owners of good properties. The causes for these prognostications are traceable to the recent successes of a few well-known mines; the two most prominent among quite a number of this class are the Montana, of Helena, M. T., quoted yesterday at £9½ per share, par £1, and the Mysore Gold Mining Company, of India, yesterday at £7½. Two years ago these shares were selling at five shillings each. Apropos of this subject the *Financial News* says: "One of the most likely baits for drawing out a speculative public is a gold-mining boom; present indications all point to that, and before we know where we are we may have a gold-mine fever in full blast. Things are now in training for possible sensations in gold mining. Both in India, South Africa, and Australia, but especially in India, we seem to be on the eve of great events."

Let me add, in conclusion, that if the boom comes through favorable workings in India, all gold-producing localities will profit by it; for, as I said in the beginning, as London goes so goes the world, and if the English want gold mines, Americans will want them. The excitement will spread and every owner of a good mine will be benefited by an advance in values for this class of property.

C. H. E.

London, Sept. 6, 1886.

OUR MINES.—Many people abroad entertain the belief that the mining industry will gradually decline, and counties now extensively engaged in the business of extracting the precious metals will, in a few years, decrease in material wealth and prosperity; that they will gradually decrease in population, and cease to pay for money invested in them. It is probable that there may be mining counties where such a state of affairs exists. There may be counties where mines are not permanent, and investments in them insecure, but it is not the case with this county. To-day its prospects are brighter than they ever were. There has been more gold extracted and more money expended in opening out and developing new mines than was ever done in the same length of time since the county was first settled. We hear of no complaints from those who have worked their mines this year on account of pay. On the contrary, nearly all the mines of the county have yielded large returns. Those who have money invested in the mines have no desire to sell, but are very anxious to invest in other mines. Outside capitalists will find a confidence exhibited by men of means living in the county, that will convince them of the permanency of the mining interest. Instead of the mines playing out in a few years, it is believed by those who are competent to judge that for years to come the amount of bullion extracted will be larger than it is to-day, and the number of mines many times greater than at present. The outlook could not appear more encouraging, and argues well for the future of the county.—*Nevada Co. Transcript*.

THE Oroville Mercury says: "There will be no mining of any consequence at Big Bend this summer. They have a flume 1000 feet long and 18 inches wide that is now carrying the water in the river the tunnel would not take, which is about 10,800 inches. By running this water thus the permanent dam can be constructed this summer. They are now preparing to put in the machinery to enlarge the tunnel this winter, and will in a short while commence the work. The necessary enlargement will be made, and next summer a large portion of the bend will be mined."

CHEAP LABOR.—The best female lace-makers of Saxony are not able to earn more than 60 cents a week.

## A Restless Foundation.

## The Towns on the Comstock.

Ever since the first workings of the Comstock, says the *Virginia Enterprise*, or from the time when ore was commenced to be extracted in large quantities from the body of the great lode, some portions of this city and Gold Hill have been moving in some direction or other. This has been, and still is, owing to the vast amount of mining going on down beneath the foundations. This is easily understood when it is borne in mind that the first mining was at the outcrop of the ledge, at the western side of both towns, and passing beneath, at an angle of 45° eastward and downward, these workings have been extended to beyond the eastern borders, or about a mile from the croppings or place of commencement.

The first extensive settling of the ground was caused by the caving of the large worked-out chambers in the upper workings of the Gould and Curry mine, above B street, to the depth of 300 or 400 feet. A considerable extent of the surface sank in, and subsequently, by degrees, the surrounding territory, including a long section of B street and the west side of C street, settled considerably, and all toward the Gould and Curry workings. Scores of buildings whose foundations were thus disturbed were thrown out of line, and some brick buildings nearly or quite ruined. This settling was aided much by the upper workings of the Savage mine, which were merely a continuation of the Gould and Curry. On the west side the settling extended to the highest croppings, the great mass of the mountain side gradually sliding downward and eastward, leaving a long cleavage or offset some hundreds of yards long and from two to six feet high, following the croppings north and south, which was plainly to be seen from C street. This occurred about 23 years ago, but the marks mentioned are still easily pointed out, and the settling doubtless continues to a more or less perceptible extent. A year or two later a similar cave and settling occurred in the mines of Gold Hill proper, with similar results to the buildings within its influence, and at other points along the lode the early workings have induced a corresponding settling of the surface.

The rich bonanza workings of later years, at either the north or south sections of the Comstock, in this city or Gold Hill, being much deeper and further east, the settling is only perceptible at the surface by the cracking or slight derangement of some brick buildings or the occasional pulling apart of water or gas mains. Most of these pipes have thus had to be fitted with slip joints or sleeves, some of them within the last few weeks. This pipe derangement has been more perceptible at the Sutton avenue section, although the pipes most recently pulling apart have been on B street, south of Taylor, and the latest, last week, on C street, in front of the Bank of California. This shows the great mass of the city foundation to be moving eastward and northward from the points mentioned, settling concentrically toward the Consolidated California and Virginia bonanza workings, whence so many thousand tons of ore have been and are still being mined. The old saying that "nature abhors a vacuum" is easily applicable, for no timbers or waste can possibly fill in mine workings as solidly as the material which has been removed; the settling of the whole body of earth above is therefore inevitable.

So, also, in Gold Hill, the main body of the town has shown a tendency to settle toward the extensive deep bonanza workings of the Yellow Jacket, Kentuck, Crown Point and Belcher mines, the water mains pulling apart at the upper end of town and pushing together at the lower end, slip joints having to be applied in both cases. The most notable illustration is the railroad bridge across Crown Point ravine. It is 84 feet above the bed of the ravine, and the deep ore workings in the Yellow Jacket and Kentuck beneath a few years ago caused the steep hills at either end of the bridge to draw or incline toward each other several inches, a fact easily demonstrated by the railroad track, and the abutments of the bridge itself. Subsequently the much more extensive bonanza workings in the Crown Point and Belcher mines further south checked this movement, and the hills have since been as gradually receding.

The only solid section of ground on the line of the Comstock is the Divide, between this city and Gold Hill. No extensive ore bodies have ever been found beneath that locality, consequently no great chambers have been excavated to cause any settling above. Not that the dwellers on that section are therefore any safer than anywhere else on the Comstock, for notwithstanding the demonstrated fact that the broad piece of Mt. Davidson's rugged side upon which this city is located is eternally moving in some direction or other, there can be no sudden or disastrous cave down into the mining depths, and most residents would not know that their houses were moving at all were they not told.

THE GREAT REFLECTING TELESCOPE, at Melbourne, is devoted chiefly to the observation of nebulae. With it have been discovered indication of great changes in some of these celestial bodies during the last few years, such changes being sought to confirm the generally accepted nebular theory of the origin of the solar system.

## High Explosives.

Ever since the first successful introduction of nitro-glycerine as a blasting agent, numerous devices have been resorted to with a view of lessening the danger attendant upon the manufacture, transportation and handling of this powerful explosive. It is a well-known fact that nitro-glycerine in its raw state is far too powerful an agent for general use, so that it has been necessary to prepare from it blasting compounds of varying strength, which, at the same time, must be possessed of great durability.

After a series of most elaborate experiments in both Europe and America, methods have been discovered whereby nitro-glycerine can be so mixed with both inert and active materials as to produce not only an explosive of any desired strength, but such that can be handled and transported with comparative safety. As a matter of fact, some of the nitro-glycerine explosive compounds now in use are far safer than the old black powder formerly exclusively used in connection with mining.

The nitro-glycerine compounds in use in this country are very numerous, one of the best known being that called Hercules. In Europe the word dynamite is applied to all compounds of nitro-glycerine. In the past few years there has been a rapid increase in the number of nitro-glycerine compounds for blasting purposes, the manufacturers of each variety claiming that their powder possesses great advantages over all others.

It is an unfortunate fact that many, if not most, of these new innovations are absolutely devoid of merit, and are quite often extremely dangerous, the character of the ingredients being such that one reacts on the other, giving rise to spontaneous decomposition, which, under favorable conditions, will result in spontaneous combustion.

These compounds are boldly placed on the market, generally with fanciful names, and without regard to the fearful risk of life attendant upon their transportation and use. In most European countries, but more particularly in Great Britain, the manufacture of high explosives is subject to constant inspections, and no compounds are allowed to be placed on the market which are imperfectly or dangerously prepared.

With a view of showing the miners of this coast the nature of the work performed by these inspectors, some abstracts will be given from the "Report of Her Majesty's Inspectors of Explosives," for 1885. Deaths in the manufacture of explosives during 1868, 1869, 1870, inclusive, 43; deaths in the manufacture from 1868 to 1874, 39½; deaths in the manufacture from 1871 to 1874, 37; deaths in the manufacture, eight years, 1878 to 1885, 8.25; deaths in the manufacture in 1885, 5.

"In the report for 1882 and 1883 we made some observations on the subject of *blasting gelatine* in the production of a uniformly satisfactory quality of which explosive difficulties had arisen, leading, in 1882, to a suspension of the manufacture for a considerable time.

"In our last annual report we mentioned that the manufacture of this class of explosive had been resumed, subject to certain modified tests which had been formulated as the results of careful and prolonged researches by Dr. Dupre and Sir F. Abel.

"During the last year the manufacture of blasting gelatine and gelatine dynamite has been actively pursued, but we regret to state that the manufacturers have not invariably succeeded in finding a material which satisfies the tests for chemical condition; for although a large proportion of the material has furnished very satisfactory results, several instances have come under our observation in which the explosive fell sensibly short of the licensed requirements in regard to its condition of thorough purification, and we regret to say that it has been our duty to place not inconsiderable amounts under seizure on this account, and to require all blasting gelatine and blasting dynamite now in the company's magazine, and in those of their agent or under their control, to be returned to the factory.

"We are at present in communication with the manufacturers on the subject and have emphatically intimated to them that unless the tests laid down as formally accepted by them can be uniformly satisfied, the issue of the material must again be suspended. It is worthy of notice that, whereas, the former difficulties were connected with the physical character of the material, those now experienced have reference to its chemical character.

"Tonite and Potentite appear to find favor for certain classes of work. The tendency is decidedly in the direction of a development of the nitro-glycerine group of explosives as distinguished from the gun-cotton class.

"Eight applications for new explosives were referred to us during the year, but in two cases only would we report favorably.

"Imperial powder, an admixture of chlorate of potassium and charcoal, was condemned.

"Ammonia dynamite consisted of thickened nitro-glycerine, with which nitrate of ammonia was incorporated. Nitrate of ammonia is a very deliquescent salt and rapidly absorbs moisture from the air. In consequence of this, it soon liquefies and runs out of the cartridge, leaving behind the thickened nitro-glycerine only. This thickened nitro-glycerine by itself

is a soft, semi-fluid substance, and in its turn is liable to run out of the cartridge, particularly in warm weather, thus constituting a very grave danger. The report was consequently unfavorable.

"Forcite consists, professedly, of nitro-glycerine thickened or gelatinized by means of cellulose which has been subjected to the action of water in a high-pressure boiler. The samples submitted, however, consisted of a thin blasting gelatine, with which were incorporated nitrate of potassium, wood meal, and a small proportion of dextrine. The explosive did not show sufficient stability, and the report was consequently unfavorable."

Three other new powders, known as etnite and kinetite and turpine, are composed of various mixtures with chlorate of potassium. The report states of them: "All chlorate mixtures are liable to what is termed spontaneous ignition or explosion in the presence of a variety of materials, more particularly of such as are acid, or are liable to generate acid, and all chlorate mixtures are readily exploded by percussion, but more particularly by combined friction and percussion."

From the foregoing extracts from the report of Her Majesty's inspectors it is evident that there is great danger connected with the handling of many of the explosives now being sold. In addition to the great danger in their handling, there is also the great loss connected with their use, as it takes some time before the miner can become accustomed to the action of any new powder. Nothing can be of greater importance than an explosive of known and uniform strength. The character of the substances entering into the composition of the explosive, and their chemical and physical effect upon the nitro-glycerine and upon each other, should be known. Blasting gelatine, gelatine dynamite and ammonia dynamite are sold in the market, and the latter is sold without any intimation to the consumer that it contains tartrate of ammonia, which compound has received such unqualified condemnation in the report of Her Majesty's inspectors. Forcite is also being introduced here. The danger connected with this powder has also been given in the extracts from the inspectors' report. Purchasers should be careful to select only the high-grade powders which experience has proven are safe to handle and use.

In the dynamite and nitro-glycerine compounds which have a uniform composition of well-known ingredients, such as the Hercules powder, for instance, sold in this market, there is not the danger encountered in commoner powders. The company manufacturing this powder claim to have steered clear of all those objectionable ingredients that are prone to spontaneous decomposition, such as impure blasting gelatine, nitrate of ammonia, dextrine in all shapes and forms, and have rigidly adhered to the manufacture of a reliable and safe explosive, and have not, like some manufacturers, changed their formula with every change of the moon. With reliable powders of the high-grade class there is both economy and safety, and those which have a well-earned reputation in this direction are the cheapest in the end.

AN EXPERIMENT IN A CHARCOAL PIT.—A few days ago an interesting experiment took place at a charcoal pit five miles from town. It appears that the men at the pit were greatly blamed by their contractor for alleged carelessness in their work. He claimed that the returns of charcoal were insufficient for the amount of wood consumed, because of some waste in the burning. In order to show the falsity of this claim, the men selected a new pit, placed one dozen silk handkerchiefs at the bottom of it, and carefully piled on top of them 16 cords of wood. A fire was started and the wood burned. Upon the coal being removed, the handkerchiefs were taken out and found to be wholly free from injury. The result of the experiment so surprised the contractor that he immediately apologized to the men, and advanced their contract price to one-half per cent a bushel more than the contract calls for. In this connection it is interesting to note that over 80,000 bushels of charcoal are turned out in the pits here every year. The Buttes Company alone utilizes 20,000 bushels.—*Sierra Tribune*.

THE ORIGIN OF A SALT MINE.—On the eastern coast of the Caspian sea, a curious phenomenon is in progress. The Kara Bobbas is an estuary nearly separated from the main body of the sea by a bank through which there is an inlet. The evaporation from this gulf is so great that a current continually sets in from the Caspian; and as there is no return current, the water of the gulf becomes more and more saliferous, and a deposit of salt is in course of formation. In time this gulf will be cut off from the Caspian, and will then be dried up and become an extensive salt bed.

NAPHTHALINE, as a wood preservative, is now largely used in that capacity in Scotland, its action being to destroy all albuminoid compounds in the wood, leaving it dry and clean to handle, and with only a faint aromatic smell. The naphthalene is melted in a vessel capable of being tightly sealed, and the wood is laid in it until experience shows that the saturation is complete. The temperature at which timber is treated is kept as low as possible, so as not to injure the fiber.

## Tree-Planting.

The custom of appointing a tree-planting day now prevails in eight States and should find favor in every State and Territory. There is no State in the Union that needs trees more than California. We are glad to see the question again agitated. It cannot be too often and earnestly insisted upon. Were the farmers on the treeless plains of this State, in addition to their orchards and vineyards, to plant a few acres of forest trees, they would not only in the near future receive a rich reward in the shape of timber, but would largely solve the irrigation question.

History will vindicate the statement that one of the causes of the impoverishment of a country and the extinction of civilization has been the destruction of forests. The cutting down of trees means exhaustion of springs, changing the climate and producing arid desert wastes and excessive alternations of heat and cold. With the disappearance of trees, men vanish. This is the reason why Syria, Greece, Asia Minor and parts of Africa are so largely abandoned. The result of cutting mountain forests is that the surface water, produced by snow and ice, instead of being absorbed and retained by the vegetable coating, rushes down the valleys in tremendous torrents, and instead of penetrating and fertilizing the soil becomes the agent of devastation. We have one familiar illustration. The Ohio river overflows with almost every rainfall. The clearings on the slopes of the Alleghanies are said by those who have made a study of the problem to be the cause of this immense volume of water. In some sections of New York, where the forest trees have been cut away, it is said that wheat now often fails, from winter killing, although the soil is of excellent quality.

The plains west of the Missouri are now a promising theater of the tree-planting experiment. It is claimed that in some localities where farms have been made, villages built and trees planted, the dry, parched soil of 20 years ago is clothed with a rich verdure, and river-beds that were half the year dry are now constantly covered with running water. It is well known that the city of Denver was built on one of these ancient river-beds, where it was supposed water would never again flow; but there is now a permanently running stream, so large that it has been found necessary to bridge it.

If such is the value of trees and their effect upon climate, the subject of forest culture demands the attention of all cultivators of the soil. And nowhere is this claim more imperative than upon the farmers of California. The uninterrupted rays of the sun falling upon these plains, covered as they are in the late summer only by a dried vegetation, heat the atmosphere to such a degree that it is able to contain an unusual amount of uncondensed moisture. The consequence is, the moisture in the atmosphere is carried by the prevailing winds over the Sierra Nevada range until it reaches the Rocky mountains, where, being condensed, it falls in abundance of rain. The very nakedness of the earth's surface becomes the cause of perpetuating this condition from year to year. Nature has no power to arrest this evil. It must be done by artificial agency if it is ever done, and Nature kindly suggests the remedy. No well-wooded country ever suffers from a long-continued dry season. And who can doubt that if the plains and deserts of California were liberally covered with clumps of trees there would not be a greater condensation of moisture, and rain-showers would keep up a growth of vegetation later in the season? It may be as we have suggested, that forest culture on these dry and parched lands would tend to solve the vexed irrigation question to some extent. At all events, it is time our farmers were urged to preserve a portion of their forests and plant forest trees where they have none.

## Death to Coyotes.

The Red Bluff *Sentinel* says that B. A. Bell, supt. of the Gallatin ranch, has discovered an excellent plan to get rid of coyotes. He first had five iron picket pins made. He got an old ewe of little value and took her to the range where a band of mutton sheep were herded. He tied a rope about six feet long to her neck and the other end of the rope to a picket pin, which he drove into the ground. He then planted four steel traps at equal distances from each other in a circle, a short distance outside the circle that would be made by the sheep round. Over the ground and traps hay was spread so that the coyotes could not see them. The trick worked like a charm, and for three mornings in succession Mr. Bell had the satisfaction of finding a live coyote in one of the traps. He changed the location of the old ewe and caught two more coyotes. Since that time he has not been troubled with coyotes killing his sheep.

TRANSFERRING RAILROAD TICKETS.—The Supreme Court of Nebraska has ruled that a non-transferable railroad ticket, if sold to a third party, cannot be seized by a conductor from the holder on a breach of contract, the holder being entitled to possession in order that he may recover the amount paid for it from the vender.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TREE COVERS.—Jasper Stahl, S. F. No. 349,066. Dated Sept. 14, 1886. This invention relates to a device for covering trees so as to inclose the tree for the purpose of introducing fumes to destroy scale or other insects which may be upon the tree; and, in connection with the cover, a mechanism by which it is raised, lowered and adjusted so as to be easily placed on the tree or removed therefrom.

BRIDLE BIT.—Geo. A. Doherty, Crescent Mills, Plumas Co. No. 349,088. Dated Sept. 14, 1886. In this bridle bit the mouth-piece has one of its ends split into longitudinal sections, hinged together and provided with a two-part socket, forming, when the sections of the split end are closed, a complete hole or aperture. A removable rein ring fits in this hole, and a tubular rubber piece or sheath fits on the mouth-piece.

HEEL DIE.—Wm. Watson, Victoria, B. C., assignor of one-half to Geo. M. Irving. No. 349,071. Dated Sept. 14, 1886. This die is intended for cutting out the sole-leather sections for the heels of boots and shoes. It consists of an expansible and contractible die, a handle with a cross-base on top of the die, and adjustable clamps through the cross-base and engaging the die, whereby it is rigidly fixed where adjusted. The object of the invention is to provide a simple and effective heel die adapted by its adjustments for cutting out various sizes of sole-leather sections.

AUTOMATIC ATTACHMENT FOR WORKING SHIPS' PUMPS.—Edward Everding, Eureka, Humboldt Co., Nev. No. 348,956. Dated Sept. 14, 1886. This is an engine or attachment for operating pumps on vessels, buoys, etc., where the rolling or pitching motion can be utilized for the purpose. It consists of a cylinder having a piston working within it, and a piston-rod which is connected with the handle of an ordinary ship's pump. The cylinder has a pipe extending from its lower end, either directly through the bottom of the vessel or otherwise, so as to enter the water so that the rising and falling of the vessel in the water operates the piston, and through it the pump. Suitable valves and pipes are provided.

WELL-BORING TOOL.—John A. Woodhouse, Santa Ana, Los Angeles Co., Cal. No. 349,192. Dated Sept. 14, 1886. The tool is intended for displacing boulders and stones in the hole in advance of the descending pipe. It consists in a cylindrical stock, a proper point, a series of expansible spring plates uniting the stock with the point, an expanding sector-block upon the head of the point and bearing against the spring plates, a rod screwed into the stock, and having a conical point for adjusting and operating the sector-block, and a peculiar guide and sinker coupled through the intervention of suitable jaws to the head of the tool. The tool is adapted for use in rocky strata, and it will displace and hold back loose rock, boulders, etc., leaving a space larger in diameter than the pipe which follows the tool.

CONCRETE MOLD FOR WALLING WELLS, ETC.—Ernest L. Ransome, S. F. No. 349,058. Dated Sept. 14, 1886. The patent covers certain improvements in that class of molds for concrete work which are adapted to expand and contract in order to be fitted in place, and relieved again after the concrete is filled in. These improvements consist of the construction of the elastic or springy bands which form the ribs of the mold, of two or more strips of wood bent to the necessary curvature or direction of outline and secured together, of the end standards of the bands, of the particular mechanism for effecting the expansion and contraction of the mold, of the particular mechanism for vertically adjusting the mold, and of certain details of construction.

PREVENTING OBSTRUCTION OF STREETS AT FIRES.—Julius R. Meyers, S. F. No. 349,051. Dated Sept. 14, 1886. The object of this invention is to prevent the obstruction of railroad tracks at fires and still provide for leading the hose back or forth as may be necessary. Pipes are placed at intervals and imbedded permanently in the street, passing transversely under the road-bed of the railway. Their ends are upturned and fit through the bottoms of boxes or casings, also imbedded beside the track. These boxes have covers, which, when removed, admit of reaching the upturned ends of the pipes which are prepared so the hose ends may be coupled to them. A section of fire hose from the hydrant or engine reaches to the imbedded pipe end at one side of the track, and other lengths of hose may be coupled to the opposite end of the pipe. The hose does not, therefore, cross the track, and cars may pass at any time. This device is specially adapted where cable cars are used, as the ordinary jumpers or bridges for hose cannot be used in the case of cable cars. The imbedded pipe would pass under the cable tube.

It is said that the application of a bit of ice, or even cold water, to the lobe of the ear will stop hiccupping.

## Passing Events.

Silver still continues to advance, 96½ cents being bid in this city on Thursday. This is most encouraging to silver miners, who hope to see it up to \$1 an ounce before very long. Every cent makes a difference to those who are mining for this metal.

It is stated that the proprietors of the Virginia and Gold Hill Water Company are arranging to put in larger pipes across Washoe valley so as to furnish water enough to provide pressure for hydraulic pumps for the Comstock mines, and enough also for motive power for the stamp-mills. All this is in the direction of cheaper working of low grade ores.

Quicksilver has got up to \$40 a flask. This is a rise of \$10 a flask since the 1st of January. The rumors of the sale of the New Almaden mines to James G. Fair have not been verified.

As stated elsewhere in the PRESS, the gold quartz-mining industry of the State is still more active and attracting more attention. Men are at work in all of the camps developing new mines or reopening old ones.

**THE WIGGINS EARTHQUAKE.**—The cataclysm so confidently predicted by Mr. Wiggins to occur on September 29th did not come off on time. Though scientists everywhere stated that there were no means of predicting earthquakes, thousands of people were alarmed at the predictions of disaster, and felt sensibly relieved when the day passed as other days do.

## California Mining Progress.

The Land Office Department of the Central Pacific R. R. Co. in this city has a pretty good opportunity of learning of the gradual development of different portions of this State. For the first time in some years the officials notice that a revival is going on in mining affairs. Not only people from this State, but persons from the East, are looking to mining rather than to agricultural enterprises as a scheme for making money. A very considerable number of new quartz mines have been opened on the western flanks of the Sierra and much land which came within the railroad grant has been abandoned to miners who have proved its mineral character. The greatest activity in this direction seems to be in Butte county, where several new quartz mines are being worked successfully, some of them paying unusually well. A great many prospectors are out, and there will probably be before long new mines added to the list.

This proves what we have repeatedly said of late with regard to California progress in the quartz-mining industry. It may be said, however, that San Francisco is far from doing its share to this development. The city originated from the mining industry, built up by it, made famous by it, and having thousands of splendid structures erected through its instrumentality, pays slight attention to mining in these days. Its citizens seem to have forgotten that it was never more prosperous than when the mines were at their best, and that its progress has been comparatively slow since mining has been neglected. With few exceptions most of its wealthy men have ignored the mining riches so close to our doors.

Yet in spite of lack of encouragement, and against even a pronounced opposition, the mining industry of California has thriven and grown, until to-day the quartz and drift mines are in a better condition than ever before. By-and-by the citizens of the metropolis will wake up to find that the best mines are in the hands of people from other States and other nations. They will learn that the miners have worked out their own salvation, and learned to mine economically and with wisdom, so as to make the business more profitable than commercial venture; that the wide gold field which elsewhere would be more highly considered will pay better than loaning money on "securities," and that they have neglected opportunities for years which should have been taken advantage of.

The miners now scarcely think of looking in this city for aid. They go to New York, Boston, Denver, Chicago, St. Louis or London for purchasers. Abroad our gold mines are more highly thought of than at home. We have not been able, apparently, to see the difference between stock-dealing and mining, and because mining stocks are lifeless, we seem to think the mines are, too.

The truth is, there never was a time when over a score of California mines were listed on the Stock and Exchange boards. Most of them have been worked as business propositions, and to-day this is as true as ever. The stock lists show a paltry half dozen or so California mines, while thousands are being worked to profit. Every year, when the account of the year's work is summed up, California comes in the second place in total production of precious metals, and first as a gold-producer, as compared with other States and Territories. And yet more than half the people of this State think mining is "played out" in California. An industry which produces in new gold \$16,000,000 to \$18,000,000 a year is suffered to get on the best way it can without financial or legal encouragement. It is no product of barter or exchange, but bedrock production of so many new dollars each year. The money spent to produce it is not lost. It is still in existence in other hands, while the dollars produced are new, and added to the world's circulation.

If some dim realization of these facts could be brought to the minds of our communities—which it seems difficult to do—great good would result. As long as people consider an industry depressed they avoid it and help to crowd it down. Once let them realize its prosperity, they are willing to assist it. Those at all familiar with the subject are perfectly certain that the gold-mining industry of this State, under the improved existing conditions, will gradually increase in value and extent for many

years to come. Old mines are being reopened and new ones found in all directions in our mining counties. The center of our quartz-mining industry is in Nevada county, and in that region they are making more progress than ever. The miner built up this State, whatever may be thought to the contrary by late comers, and his industry should be better encouraged and fostered than it is. The MINING AND SCIENTIFIC PRESS, the oldest mining paper on this continent, which has watched this industry carefully for years, is perfectly confident that, though long depressed, the gold mining of California is on the steady up-grade of prosperity.

## Mica.

Mica is one of the commonest minerals and occurs in greater or less quantities in a variety of rocks. The term "mica" covers a number of mineral species all similar in their scaly structure and general chemical composition, yet only one of these species—muscovite—has any commercial value or is popularly recognized under the generic name. It is usually disseminated or minute scales of no practical value, its occurrence in sheets or plates large enough for economic working being quite limited. Even when found in suitable size and abundance it is apt to be defective in structure or so stained and spotted as to be worthless. To be advantageously marketed the mica should yield trimmed plates not less than three inches square, and these should be tough, clear, even in texture, without flakes, and capable of being smoothly split into exceedingly thin layers. Even in places where there is an abundance, only a small portion of the mineral taken out is available for use. The waste and clippings far exceed what is mined and marketed. It is chiefly used in the manufacture of stoves, lampshades and lanterns, although some of the finest mica is employed for the dial-plates of compasses. The waste trimmings, when ground, are used to a limited extent as an absorbent of nitro-glycerine in making high explosives, for glistening wall-papers, as a lubricant, in making "brocade" pigments, and as a substitute for asbestos in making fire-proof roofings.

The mineral is found all along the Eastern slopes of the Appalachian system on an almost continuous belt from Maine to Alabama; in numerous places it is mined in the New England States. In New Hampshire mica mining is quite an old and established industry along the belt of country southeastward of the White mountains. In all the Southern States it is more or less abundant. Mica mining has also assumed importance of late in the Black Hills, Dakota. In the best mine there only about five per cent of the total mica extraction is of merchantable quality. Some of the finest sells for \$3 to \$4.50 per pound. Custer county, Dakota, up to July, 1884, had produced 124,640 pounds of marketable mica, worth \$442,589. In Colorado, Wyoming, New Mexico, Arizona, Oregon and Alaska this mineral has been found, and in many places in this State. None worked here has ever been profitable, owing to its lack of clearness and proper texture. The best in the country comes from North Carolina and Dakota. It is difficult to find any market for mica on this coast, so that no mica mining of consequence has been carried on.

It is within the past two years that mica of the best quality, known as muscovite, has been discovered in Canada in marketable sizes and in paying quantity, and to-day several deposits capable of being developed into fairly productive mines are known. Two in the county of Frontenac, Province of Ontario, show well-formed, large crystals at the surface, imbedded in white quartz; another in Wakefield has been uncovered, and numerous "crystals" have been exposed, which, though small, are of excellent quality. In the Lake Superior and the Lake of the Woods districts good mica has been discovered in paying quantity, and a company has been formed in Winnipeg to work an important deposit in the last-mentioned locality. In British Columbia, also, a fairly good quality is known to exist, but no attempt has been made as yet to prove the size of the available "crystals" or the extent of the deposit in that province.

THE Black Hills has produced in the last ten years not less than \$25,000,000 in gold, silver and base bullion and placer gold, an average of \$2,500,000.

## Local Experiments with Wave Power.

Some very interesting experiments are being carried on at the ocean beach, about 1200 feet north of the Cliff House, with a view of utilizing wave power, the ultimate object being to supply this city with some 50,000 or 60,000 horse-power for industrial purposes, water being used instead of steam. The experiments are being carried out by E. T. Steen, a mechanic of this city, and several thousand dollars have been spent thus far for plant, trials, etc. The idea is to raise sea water, through the medium of a pump operated by the waves, to a height of about 350 feet, whence it can be directed into the city and the power used for elevators, mills, manufactories, etc.

The apparatus is exceedingly simple. A bridge has been built across a chasm into which the waves roll, and from the bridge is suspended a strong frame carrying a swinging arm or lever, the lower end of which carries a float or paddle immersed in the water. This lever or arm has its upper end suitably connected by rods that extend to a heavy crosshead. The lever is 32 feet long. The crosshead is connected with the plunger of a pump of 12 inches diameter and 13-foot stroke. The pump is 24 feet above low-water level. As the lower arm of the lever moves to and fro with the action of the waves it operates the pump, drawing the water from the sump and forcing it to the reservoir on the hill.

The float on the submerged end of the lever is intended to be only about one foot under water. It is not placed in the long rollers, but works in the water inside the first line of breakers, so it obtains the force which dashes the waves against the rocks. The operating lever swings on the arc of a circle, and can readily be withdrawn from the water as occasion demands, the power required to do this being furnished by a water-wheel.

It is intended, provided the experiments are satisfactory, to establish a line of these pumps and levers. Other pumps, 16 or 17-foot stroke, will be put up. Full stroke is seldom taken, the great length being given to provide for emergencies, so as not to break the pumps. At present they are pumping through pressure-valve and meter to determine power, etc. The force of the waves to the square foot is very large, and those engaged in the enterprise are of the opinion that storm waves will not seriously affect the motion. The high tides make no difference, either. The pumps, it may be stated, are placed horizontally.

When Balboa "discovered" the Pacific he stood knee-deep in the placid waters at Panama, and the name given the great ocean was appropriate to the locality. This far north, however, it is a misnomer, for the waves are large all summer, owing to our prevailing strong winds, and the winter storms off shore and near shore create large rollers constantly. There is always plenty of sea to operate a contrivance of this kind, therefore, in these latitudes. There has been plenty of talk of wave and tide motors for many years past, but this experiment is being put to practical test. When the results are formulated and details known, we shall give them in the PRESS. There is no intention of attempting to carry out the power scheme for the city manufactories, until a thorough demonstration of the practicability of the plan has been made.

MR. W. A. GOODYEAR, well known on this coast from his long connection with the California State Geological Survey, and his authorship of a work on the "Coal Mines of the Western Coast," has returned to San Francisco after an absence of several years. He proposes to settle in California again.

THERE is again talk of the Iron Mountain mine, Shasta county, being started up. It seems more probable that the failure there is due to lack of valuable material in the ore than to imperfect processes. And the same may be said of Meadow Lake district.

THE new stamp mill in Detroit district, Utah, has proven that there are gold ores there worth working. The great difficulty is the mill is far away from the mines, in order to be where water is obtainable in sufficient quantity.

POOL SALES of Lake copper, amounting to 20,000,000 pounds, have been made at 11½ cents per pound.

## Centrifugal Pumps and Draining Machinery.

[Written for the Press by J. RICHARDS.]

NUMBER 2.

## History of Centrifugal Pumps.

It will be proper here, and before entering upon a history of centrifugal pumps, to offer some remarks upon the United States Commissioners' report of the Vienna exhibition of 1873. To this report is due, unfortunately, in a great measure, the idea of such pumps being of European origin, both by the distortion of facts and the gross ignorance of hydrodynamics, which it presents.

Without wasting space to quote from this report, the following salient points appear (see pages 193 and seq.): (1) Appold was the introducer of this class of pumps. (2) They are misnamed centrifugal, because they do not operate by centrifugal force at all. (3) They operate by pressure the same as a turbine water-wheel. (4) When people understand their method of operating we may expect much improvement. (5) They should have disk runners, because the fan-wheels will soon wear out.

This much, I think, will do, and as it stands printed in a government publication, we can only deplore the stupidity, as well as presumption, of the commission who thus disposed of a subject that had 20 years before been carefully investigated by such men as Sir John Rennie, Professor Cowper, Mr. Whitelaw, Dr. James Black, Professor Rankin and many others. The most astonishing part is, however, that this report was passed and presented by Professor Thurston, who we can hardly suppose would fail to see its absurdity.

It would be as tedious as it is useless to search for the first application of centrifugal force to moving and impelling fluids. I presume each prominent nation in Europe considers the discovery as belonging to their people; and, as before remarked, it was a matter of no concern until it came to be applied to useful purpose and took place as a "manufacture."

There is too often a desire to place strained construction on old inventions or precedents, often taking form as ridiculous as unfair. Fortunately, in the present case, this necessity will not appear. To begin back far enough, however, to lend some air of antiquity to the subject, one of the oldest drawings, extant at this time, is that of Le Demours, a Frenchman, dating from 1732. It is a kind of "Barker mill" machine, and the forerunner of various other pumps on the same principle, that of Barker's mill inverted, which have been periodically invented ever since, one within the writer's knowledge a few years ago in California. The same invention, or "mode of operating," was soon and often discovered in connection with reaction water-wheels by their overrunning and drawing the water from the chute or inlet after the gates were shut.

Mr. Whitelaw, the inventor of reaction wheels, in their common or applied form, himself converted the method to pumping by centrifugal force, and made pumps of the submerged type that gave some very good results, which were fortunately tabulated in a careful manner, in 1849, at Johnstone, near Glasgow.

These tables contained factors for friction of both water and machinery, with exact measure of resistance and power that would do credit to a scientific committee of our day. The tables will be given in another place. Whitelaw's pumps were first made about the year 1848.

To begin at the true beginning, when centrifugal pumps first took practical and useful form we have to, as before claimed, come to the United States.

## The Massachusetts Pump.

A pump embodying almost every essential feature of modern practice was invented in Massachusetts in 1818—30 years before the same thing was applied in Europe, and 40 years before there was a modification there that can be called an improvement.

The drawing (Fig. 1) is a section through the Massachusetts pump. It is, as can be seen at a glance, the "parent of its tribe"—the completed machine, and in useful effect would equal, if not excel, either of the modifications exhibited at London in 1851, 33 years later.

It is proposed, however, in the present chapter to deal with the chronological part of the subject and discuss separately the merits and constructive features of the different pumps.

The Massachusetts pump fell on barren ground; there was at the time but little use in the United States for such pumps and but

scant means of communicating inventions over the country; as before remarked, there was land enough without draining; and water raising except from wells was exceptionally required. We, however, hear of the pump finding its way to New York in 1830 and being exhibited there with very satisfactory working results—guessed at then, no doubt, but still ascertainable even now.\* The casing was beveled from the center to the periphery, but not in degree to conform to volume and velocity as a theoretical pump of our day would be, but an approximation that showed the inventor had inception of the true working conditions.

The first pumps were made to operate under water like those of Bessemer, and I conjecture the improvements mentioned in connection with

said, this pump has of right a prominent place in our "history."

## Andrews' Pump.

The next to follow was Andrews' pump, invented or published in 1839. If the Massachusetts pump came near anticipating our best modern practice, the Andrews pump completed the matter, and leaves room for the lament of Lord Byron that "those thieving ancients have stolen all of our modern ideas."

The construction is shown in Fig. 3, and excepting the straight vanes and one or two less important points the pump is capable of high duty and conforms very nearly to good modern practice.

The value of curved vanes, as will be here-

EARLY FORMS OF CENTRIFUGAL PUMPS.

the exhibition at New York, in 1830, to be the addition of side suction-pipes.

## Blake's Pump.

In 1831 Messrs. Blake, of the New Steam Mills, in Connecticut, invented a new centrifugal pump, shown in Fig. 2, and well worthy of attention as being the first of its type and almost identical with Bessemer's, of 1845 and 1849. It is, in fact, the better machine, if carefully compared, but subject, like nearly all disk pumps, to thrust upon the wheel, that would cause trouble in working.

It was in every sense a "departure," and is by no means obsolete at this day for high lifts. The force of the issuing water is lost, as may be seen by the annular casing and change of course; but this loss has to be measured by the relative speed between the wheel and off-flowing water, so that for high heads, as before

after explained, is dependent on speed or pressure and are not a qualifying factor of the pump's duty unless pressure be assumed, and I venture to claim that for low heads, this American pump of 1839, made long before any such machine was known in Europe, is, for low heads, capable of a duty within ten per cent of the best modern performance.

Its distinguishing feature comparing with its predecessor, the Massachusetts pump of 1830, is the cylindrical section of the casing, not differing at all from the patterns in use at the present time by several makers in the Eastern States.

The transverse section of the pump would show the "waterway" diminished from the inlet to the periphery to conform as nearly as practicable to volume and velocity; in fact I think it is in this respect much better proportioned than many pumps now being made and sold.

This pump, let it be remembered, was produced and publicly known five years before Mr. Gwynne's experiments at Pittsburg, and at a time and place that leaves only the Massachusetts pump as a possible precedent.

We must not, however, detract from the parent pump further than to call the present one an improvement. It is a step further in the art, and a very possible invention that any one might make, and is, I suspect, mainly the result of improvement in mechanical facilities for making the casing of two pieces of cast iron, and of cylindrical section.

## Whitelaw's Pump.

This brings us down to the time of Whitelaw's experiments at Johnstone. The exact time is not known, but it was between 1847 and 1849.

Mr. Whitelaw was the inventor of the water-wheel that bears his name, and his pumps which he describes as "especially suited for draining lands," are in most respects, as before said, an "inversion" of his water-wheels.

Fig. 4 will give an idea of the arrangement, which differs but little from pumps erected within a few years past by thorough engineering firms in England, and also of pumps made from the writer's designs now in use in California.

The most remarkable feature of Mr. Whitelaw's experiments is the very complete knowledge of hydrodynamics they show. The following are four columns out of nine his table contain:

No. of Experiment.	Revolutions of the Pump.	Loss by friction and other resistance in the pump.	Loss by force of water after leaving the pump.	Efficiency. Power of pump moving water being 100.
1	327.6	19,370	7,314	69.23
2	278.4	12,780	9,462	73.18
3	226.8	7,027	13,980	79.67
4	199.6	4,466	18,620	75.78
5	182.0	2,984	23,780	76.48

The power applied was by a dynamometer of delicate construction, and the experiments were in every way conclusive.

I do not give the formulae employed in the computations; this can be found in the *Practical Mechanics' Magazine* of 1850.

There is an erroneous opinion existing respecting the efficiency of pumps of this kind, of which more will be said hereafter; at present I will, however, point out that the effect produced by Mr. Whitelaw with his submerged wheel was seven per cent better than anything attained in the exhibition of 1867.

## Gwynne's Pump.

The next stage in our pump history begins with the experiments of Mr. Gwynne at Pittsburg in 1844. The pumps produced we can presume to be the same, or analogous to, the one patented six years later, and shown in Figs. 5 and 6. This pump affords room for extended comment, which must, however, be passed over here. It was the one shown in competition with the Bessemer and Appold pumps at the exhibition, and by no means so good a one as its predecessors in America, although more expensive and complicated. In support of this opinion I have only to refer to Messrs. Gwynne's modern practice. The discharge chamber was annular, as shown in the side view.

## Mining Accidents.

Abe Brockman, while working in a prospect claim on Kate Hayes hill, Nevada county, was caved on, and cut quite severely about the head.

The *Tidings* tells of two accidents in Grass Valley mines: At the Empire a piece of the ledge fell on the head of Thomas Halsall, cutting and bruising him severely. His escape from death was miraculous. Harry Thomas at the same mine was working around the stamps, when one of them fell and caught his right hand in such a manner as to hold it fast, while the stamp itself rose and fell with its accustomed regularity. Every movement of the stamps bruised the hand and cut the flesh nearly to the bone. In order for Mr. Thomas to extricate himself, the mill had to be stopped. No bones were broken.

Michael McNichols was killed and E. J. Morrow seriously wounded by the explosion of a number of blasts in a drift in the Lee Basin mine, at Leadville, Monday. The unfortunate miners had leased a portion of ground, and had drilled four holes during the morning, which they prepared to set off. Some delay in igniting a fuse detained them and the first blast exploded before the men reached a place of safety. McNichols had the back of his head crushed in by a flying rock, and was killed instantly, while Morrow escaped with a broken arm and several severe bruises.

\*Mr. L. Wagoner, C. E., of San Francisco, to whom this matter has been referred, estimates the efficiency of the Massachusetts pump at 50 per cent. His opinions are based upon a knowledge of the subject perhaps as complete as that of any engineer in this country.—J. R.

## MECHANICAL PROGRESS.

## The Laws of Friction.

1. Friction is greatly influenced by the smoothness or roughness, hardness or softness, of the surfaces rubbing against each other.
2. It is in proportion to the pressure, or load, that is, a double pressure will produce a double amount of friction, and so of any other proportionate increase of the load.
3. The friction does not depend upon the extent of surface, the weight of body remaining the same.
4. The friction is greater after the bodies have been allowed to remain for some time at rest, in contact with each other, than when they are first so placed; as, for example, a wheel turning upon gudgeons will require a greater weight to start it after remaining some hours at rest than it would at first. The cause of this appears to be, that the minute asperities which exist even upon the smoothest bodies gradually sink into the opposite spaces, and thus hold upon each other. It is for the same reason that a greater force is required to set a body in motion than to keep it in motion. If about one-third the amount of a weight be required to move that weight along in the first instance, one-fourth will suffice to keep it in motion.
5. The friction of axles does not at all depend upon their velocity; thus, a railroad car traveling at the rate of 20 miles an hour will not have been retarded by friction more than another which travels only 10 miles in that time. It appears, therefore, from the last three laws that the amount of friction is as the pressure directly, without regard to surface, time or velocity.
6. Friction is greatly diminished by unguents, and this diminution is as the nature of the unguents, without reference to the substances moving over them. The kind of unguent which ought to be employed depends principally upon the load; it ought to suffice just to prevent the bodies from coming into contact with each other. The lighter the weight, therefore, the finer and more fluid the unguent should be, and vice versa.—*Ex.*

## Steel vs. Iron for Carriage Work.

Mild steel is fast taking the place of iron in almost every direction. The editor of the *Carriage Monthly* was recently present and took a hand in testing some of the superior brands of this new steel. He says:

We took a sample bar and forged from the same a set of dash heels for a buggy, and when cold subjected them to all sorts of strain without fracture. We heated the same to about 700°, and cooled in cold water, and again put the forgings through another set of tests, and still no fracture. Welds are made and swaged and cooled off while at 500°, and could not be broken any more than could the same made in Norway. It was as easy to weld without flux as any ordinary iron. There was a density or hardness about it while forging it that follows in the working of Low Moor iron. When cold it is much stiffer than Norway, but will bend under a heavy pressure without breaking. It swages much smoother than iron, and consequently requires less filing or grinding. In the lathe, or on the planer, a smoother cut is made than with any known iron. Forgings can be made lighter with it than with iron, and still stand greater pressure or strain without bending.

We next had a piece lathed and casehardened with bone-dust, which was afterward put through the buffing process, with a view to show up seams, dirt or looseness. The result was, not a blemish could be detected. After nicking with a cold chisel we tried its breaking qualities over the sharp corner of the anvil, and after more than a dozen vigorous blows with a 14-pound hammer failed to break the specimen. With all these facts before us, we came to the conclusion that at last the carriage-builder has reached a proper metal for the production of his wares, provided the manufacturers will study their own interests by putting the same on the market in merchantable sizes. For all work which is subject to all sorts of adverse strains, it has no superior, if it has an honest equal, which we doubt.

**SUCCESSFUL CASTING OF IRON OR STEEL UPON BRASS.**—One of the latest inventions or discoveries in metallurgy is the casting of iron or steel on brass. It is a thing that it has often been sought to accomplish, but until recently without success. Experiments were made lately in Boston. The brass core, or whatever it may be, is first cast in the usual way, and is then molded in conjunction with the pattern, and when the latter is removed, it is allowed to remain in the flask, and the melted iron poured over it. This iron is prepared by a flux for ready amalgamation with the brass, and when the compound casting is taken from the sand, it is found to be a complete and well-connected piece. The union of the two metals is perfect, and they can be separated by melting the brass which runs at lower temperature than iron from its backing. For bearings for car axles and other things that now require solid and thick brass castings, costing quite heavily by the pound, the compound bearings, being more than three-quarters cheap iron, would form a cheap and efficient substitute. For pumps,

steam and fire engines, and many other machines and mechanical appliances, including bearings of shafting, the new compound metal will constitute a most efficient substitute for brass castings, and, what is more, an economical one. It might even be applied to ordnance of all descriptions, being used for the center or core of the cannon, and be strengthened by steel or tough iron cast on the outside. The invention seems to be a most promising and important one, and, when fully known, and if it bears out its promise, it cannot fail to come into use in nearly all lines of mechanical industry doing metal work.

**ELECTRIC WELDING.**—A new art has made its appearance and will no doubt find a wide application in electricity and mechanics. The great benefits derivable from a method by which a practically continuous wire of any desired length may be obtained are especially of value to electrical constructors. Those engaged in the manufacture of dynamos know how troublesome the enlargement caused by the splice in a wire is. In the winding of field magnets the thickening of the wire at such points is a nuisance, and the projections frequently break through the insulation, and finally develop into serious faults. With the aid of the new art it seems possible to join two wires so that the point of juncture is practically identical in size and texture with the remaining part. A remarkable fact in connection with this process is the readiness with which metals of different character can be made to weld. It would almost seem that the metals, when put in the "electrotonic" state by the passage of a current, are endowed with peculiar propensities for welding. It follows, then, that large pieces requiring to be welded would be benefited by having an electric current passed through them, even though the current alone would not be sufficient to generate a welding heat. Such is the experience of Mr. Elihu Thomson, the inventor of this process. It is quite within probability, therefore, that every large forging or rolling mill establishment will in the future be equipped with powerful dynamos for the purpose of generating currents to be sent through the metal during its process of manufacture.

**COMPRESSED WOOD FOR TOOTH GEARING AND SHUTTLES.**—The London *Engineer* describes the compression of beech and other woods by means of hydraulic presses, under the patent of Mr. Robert Pickles, of Bromley, England, who makes this wood a specialty for shuttles and for gearing. The compression of the wood improves its wear-resisting qualities to a degree that would be deemed impossible. The wood is first sawed into sizes necessary for making shuttles or cogs, and naturally dried. It is then put under a pressure of about 15 tons per square inch, in a rectangular space in the press holding six shuttle blocks, three side by side and two deep. Above is a metal block made so as to fit the space in the ram. The depth of the blocks before compression is two and one-fourth inches, which is reduced to one and one-fourth inches. The woods generally used for this purpose are beech, cornel and persimmon. The grain is very close, and the weight of compressed beech is considerably greater than that of boxwood, and when compared with uncompressed beech it is remarkably heavier. In regard to the wear of the wood for cogs it is stated that it will last a long time and run very easily.

**GLASS BEARINGS.**—Glass bearings and bushes for loose pulleys are now made by an English firm, Messrs. Powis, Bale & Co., of London. Mr. Bale's description says that Mr. Powis, with the object of reducing the working friction to its lowest limit, and experimenting with various materials, determined to try glass, and being highly satisfied with the results in his early trials adopted it. "The bearings are grooved or crenated in such a manner that the lubricating material is kept in circulation between the top and bottom half of the bearings; at the same time a current of air is allowed to pass through the bearing, thus keeping it cool while in work." It might be expected that frictionless bearings would not need ventilation.

**TO PREVENT SCREWS FROM RUSTING.**—It is well known that iron screws are very liable to rust, more especially when they are placed in damp situations. When they are employed to join parts of machinery they often become so tightly fixed that they can only be withdrawn with considerable trouble, a fracture sometimes resulting. In order to avoid this inconvenience, screws are generally oiled before being put in their places, but this is found to be insufficient. According to the *Moniteur Industriel*, a mixture of oil and graphite will effectually prevent screws becoming fixed, and, moreover, protect them for years against rust. The mixture facilitates tightening up, is an excellent lubricant, and reduces the friction of the screw in its socket.

**FURNACE SPARKS.**—The sparks collected in the extended smoke-box of a locomotive have considerable value as a fuel. This is known by the interesting fact that the contents of the smoke-boxes of bituminous coal-burning engines are being utilized for the fuel of two locomotives in the vicinity of Philadelphia, and that on the Reading road a consolidation engine has hauled a full train exclusively with such fuel. On some Western roads the same material is used in smith shops as fuel for forges.

## SCIENTIFIC PROGRESS.

## A New and Valuable Discovery.

Utilizing the Natural Grease in Wool in the Manufacture of Soap.

At a recent meeting of the National Agricultural Society of France, as reported for the *Textile Record*, the question of the utilization of the suint, the natural grease found in wool, was discussed. The subject is not a new one. Half a century ago, M. Chevreul had made known the elementary composition of suint, but from that day to this, little or no use has been found for it. Flowing from wool-scouring machines into natural water courses, it pollutes them and renders the land through which they run insalubrious. The evil is a growing one, as, since his first researches, the consumption of woolsens in France has doubled. Her annual clip has grown to 220 millions of pounds, and she imports at least an equal amount. Of these 440 million pounds, nearly 50 per cent is waste, of which the principal part is suint.

To utilize this enormous quantity to the profit of the soap industry has long been a favorite project, but the difficulties in the way have been too great, because the suint, in the condition in which it is extracted, has been found to be non-saponifiable.

To adapt it to the purposes of the soap boiler, and thus make it available in the manufacture of the 600 million pounds of soap annually produced in France, would at once rid the textile industries of a great and growing nuisance and cheapen the cost of one of their indispensable necessities. M. Rohart exhibited before the society above named a quantity of soap made by him on a large scale, from suint, at the works of Michaux Brothers, at Aubervilliers. He first changes the elementary composition of the suint by the use of sulphur. This he does by simply raising the grease to its fusing point, and bringing it in contact with sulphuretted hydrogen. The gas is absorbed in large quantities, as high as 100 times the bulk of the grease being taken up. At the close of the operation the sulphur has become a constituent of the fluid mass, which, like most all other fatty matters, when simply treated, acquires new properties, permitting it to be treated by methods altogether different from those previously employed and giving rise to products also new.

By the action above stated, suint becomes immediately and completely saponifiable in the cold. The soap formed no longer possesses the odor peculiar to suint, nor is that of sulphuretted hydrogen perceptible. An intimate combination of the constituent principles of the matter formed has therefore taken place. This is further indicated by the fact that if the mixture be run into the pans to grain at 30° to 40° C., its temperature will rise in a few hours to 60° or 70° C.

In practice, the result is of uniform quality, fine grained, and perfectly homogeneous. The operation is finished in an hour, while usually the making of a batch of soda soap takes six or eight days. The claim is made that if strong, upright machine mixers be used, 100,000 pounds of soap can be made in a day, without much expense either for labor or fuel. In view of its many applications, this is a very cheap soap.

The great interest naturally felt in this discovery is enhanced by the new chemical reaction which it has revealed—a reaction as unexpected as it is valuable. Contrary to what has hitherto been known concerning the saponification of fatty matters, this can be produced completely without first rendering the alkali caustic. Alkaline carbonates serve the purpose perfectly.

This new scientific fact is not only applicable to fats which have previously been converted into fatty acids, but is true of all such matters, including suint, which are not normally saponifiable, even with caustic alkalis; for in the presence of fatty bodies previously sulphurized, alkaline carbonates are immediately decomposed, even in the cold. Carbonic acid gas is so abundantly disengaged that unless the vessel be deep, a portion of its contents will froth over. If this be avoided, the result will be a soap perfectly defined.

The change undergone by the suint would seem to be due to substitution, a molecular movement which reveals the power of the affinity of the alkalis, or rather, perhaps, of the alkaline metals for sulphur. This fact must be recognized in accounting for the expulsion of carbonic acid from its combinations with potassa and soda. That, under the circumstances, this gas should be expelled, is not only a surprise to the scientist, but a great boon to industry. If, in the state of the caustic alkali, a certain quantity of soda cost 46 cents, that quantity in the form of carbonate would cost 29 cents, a difference of 17 in 46, say 38.5 per cent. Where, as in Marseilles, many millions of pounds of soda are annually used in the soap manufacture, the importance of this saving is manifest. Moreover, as the result is the same with the carbonate of potassa as with the carbonate of soda, it is doubtless possible to apply the process directly to the manufacture of soft soaps, using for the purpose the crude "pots and pearls" of commerce.

**WIND PRESSURE.**—The amount of pressure per square foot, with the wind blowing at 20, 30, 40, 50, 60, 70 and 80 miles an hour, is respectively 2, 4½, 8, 12½, 18, 25 and 32½ pounds.

## Causes of Earthquakes.

The following, from the *Boston Mercantile Journal*, will be read with some interest in connection with the address upon the same subject made by Prof. Le Conte, of the State University, at a late meeting of the Academy of Sciences in this city. The address alluded to was published in full in the *Press* of Sept. 11:

It is a curious fact that some days before the earthquake occurred Prof. Dawson, addressing the British Association for the Advancement of Science, said that "it was possible that there soon would be, or might even now be in progress, a new settlement of the bed of the Atlantic ocean, especially on its western side, and that there would possibly be at the same time renewed volcanic activity on the eastern margin of the ocean." This statement of possibilities reads almost like prophecy in view of what has since occurred, and it is in marked accord with the theory advanced by Prof. McGee, of the Geological Survey, that what has taken place is what he describes as "seaward slip." What he means by this expression is thus indicated:

"It is a movement of the coastal plain toward the sea. Let me say in round terms that we divide the region this side of the Appalachian Range into two portions. The granite or gneiss formation is called the Piedmont escarpment and extends from mountain ranges to about where Columbia is. The region this side of that is made up of what we call fragmental rock and is called the coastal plain. The theory is that this coastal plain has simply slipped seaward a bit and that the displacement produced the shock or tremor."

As to the cause of this "slip," Prof. McGee says that there is a tendency in that direction. Imagine a surface slightly inclined, with the coastal plain overlying it, and a sharp depression existing somewhere a hundred miles or so out at sea, and the tendency of the plain toward that depression is checked only by the resistance of friction. A point is reached, however, perhaps by reason of the readjustment of the earth's surface constantly going on, or by the deposits brought by the great rivers, where the pressure overcomes the resistance, and then a slip occurs.

**A MAP OF THE UNITED STATES.**—The Coast Survey and the U. S. Hydrographic office have spent many years in making an accurate survey of our coast line, at an outlay of about eight millions of dollars; but our internal surveys are quite inaccurate, except along the line of great trunk railroads. These surveys, as heretofore utilized by map-makers, are very inaccurate, some localities being placed fully five miles out of the way on our most accurate maps. A new map, however, is now in preparation by Col. Powell, which will be absolutely accurate within the limit of the scale of feet upon which it has been prepared. It will take about a year to complete this, and when done, it will be the only accurate map of the United States in existence. Astronomers have long claimed to have prepared a more accurate map of the moon, at a distance of 250,000 miles, than has yet been made of the State of New York from surveys made upon the ground. These maps, however, have been made by means of photography, and hence are more accurate in their outline than could have been obtained by hasty triangulations. Major Powell's map, however, will be as accurate a representation of the geographical location of the mountains, rivers and towns of our own country as the astronomers have yet prepared of the queen of the night. He has also in preparation a dictionary of altitude, by which he will set at rest the long-mooted question as to the relative sea level of the Atlantic and Pacific oceans. According to railroad levels heretofore made, the Pacific is supposed to stand about four feet above the level of the Atlantic. Within a year Powell will have settled this question.

**MAGNESIUM AS A GENERAL ILLUMINANT.**—It has been suggested that magnesium may, ere long, come into quite general use as an illuminant. Its practical introduction will depend very much, however, upon its cost, nothing but its high price preventing its practical use at this time. A few years ago it was sold at \$40 a pound. Now, by a new process, German, it can be sold at \$8 a pound, and there is little doubt that before long it will be produced even more cheaply. Its use will not be attended with danger like electricity, and it can be arranged so that even the remote country church or dancing-hall can have it, as well as the dwellers in the great cities. It can be placed in a lamp, arranged with clock-work movements to feed a ribbon of the metal regularly. It has a white vapor, oxide of magnesium, given off by the metal in burning, which will require a smoke-bell when burning indoors. It is said that a magnesium lamp of 1000-candle power throws enough light to distinguish a vessel nine miles distant. A wire of moderate size equals the light of 75 stearine candles. This would make the cost of magnesium little more than gas, even now, while no expensive works or street mains are required for its use, making its introduction for lighting towns and villages a very simple matter indeed. It has been predicted that within five years the magnesium light will be as familiar a sight in many places as the electric light is to-day.

**EYELESS ANIMALS.**—Experiments have been made by Graber which indicate that eyeless animals are sensible to light.

## ENGINEERING NOTES.

## A Petroleum Engine.

A new motor, which promises to prove a powerful rival to the gas engine, has recently been introduced into this country from Germany, where it is already in considerable use. This is Spiel's petroleum engine, the working of which was recently inspected, the example being a two-horse power engine, nominal, working up to three-horse. In general appearance the petroleum engine does not differ greatly from some horizontal types of gas engines, except that it carries a small reservoir above it for the oil. In the present instance this reservoir contains two gallons and a half of refined petroleum, which is equal to a five or six hours' supply. From the reservoir the petroleum is conducted by a pipe to a pump, by which small measured quantities are injected into the cylinder of the engine. The oil is supplied at the rate of about four drops per revolution of the engine (which runs at 120 revolutions per minute), and at a given point it is ignited by means of a small spirit lamp. The *modus operandi* may be briefly explained as follows: On its outstroke the piston draws in a charge of air and petroleum, and on the return stroke it compresses this mixture, which is exploded as the crank passes the back center. The combustion and expansion of the charge take place at the third stroke, the products of combustion being driven out at the fourth stroke. There is thus one acting stroke in every four, motion being continued during the other three by means of a fly-wheel. Vaporization of the petroleum previous to use does not take place, the engine using it in its fluid condition. In order to keep the cylinder cool it is water-jacketed. The petroleum engine presents many points of advantage, being entirely independent of any coal or gas supply. It can be set in motion in a few seconds, simply by lighting the lamp and turning the fly-wheel. The consumption of oil is automatically arranged according to the work required, and when the engine is at rest there is no expense going on, an important point where the work to be done is intermittent. This engine has been thoroughly tested by Mr. John Hopkinson, C. E., who reports upon it very favorably and places its working cost at 1½d per horse-power per hour for petroleum and about ¼d per horse-power per hour for lubricating, when developing its full power. Spiel's engine would seem to be capable of competing satisfactorily with gas engines, even where gas is available, but beyond this there is a wide and promising field for it where gas is not obtainable, and where the steam engine is inadmissible. The petroleum engine is being introduced by a company having offices at 1 Leadenhall street, E. C.—*London Grocer*.

**BRIDGING THE HUDSON RIVER.**—The final contract for the construction of a bridge across the Hudson, at Poughkeepsie, was signed on the 28th ult. with the Union Bridge Company, of New York. The bridge is to be completed by January 1, 1888. It will consist of five spans, each 525 feet long, three of which will be truss and two cantilever spans, the lower chord of the trusses to be 135 feet above high water, and the cantilevers to have a clear head-room of 165 feet. There will be a short span on the west shore and one-fourth mile of a viaduct on the east shore. The bridge will be built upon steel piers and the river spans will be also of steel. The track will be 200 feet above high water. It will be a good thing for commerce to have a bridge over the Hudson at this point, where convenient connections with railways on either side of the river can be established. It may lead to important changes in the channels of various descriptions of traffic, by greatly increasing the facilities for inland connections between coal regions and interior New England, and in other ways. The extent to which the Eastern States are still dependent upon water routes for some of their most important interstate movements is remarkable, and it would, presumably, be materially diminished by the construction of a bridge over the river, with proper railway connections.

**THE ELECTRICAL TRANSMISSION OF POWER.**—Careful experiments made at Creil, under the inspection of a commission of 38 men of science, have proven that it is possible now, with one generator and one receptor, to transport to a distance of about 35 miles a power capable of being used for industrial purposes of 52-horse power, with a yield of 45 per cent, without exceeding a current of 10 amperes. The report states that this high tension does not give rise to any danger, and that no accident has occurred during the past six months. The commission is of opinion that the transmitting wire may be left uncovered on poles, provided it be placed beyond the reach of the hand. It estimates at nearly \$20,000 the probable cost of the transmission of 50-horse power around a circular line of about 70 miles.

**THE HUDSON RIVER TUNNEL** is being pumped out after being filled with water for two years. The announced purpose is to exhibit the work to capitalists to interest them in the completion of the tunnel. Col. Haskins announces that the structure is uninjured.

**THE FIRST CITY IN EUROPE** where electricity has been entirely substituted for gas for street lighting is the town of Hernösand, in Sweden.

## USEFUL INFORMATION.

## A New Cement.

In an article on "Stuccos," in a recent number of a French contemporary, *Construction Moderne*, there is a description of a new cement. The inventor and manufacturer of this new cement is a M. Vallin, the director of a cement works in France, known under the name of "Gypserie de la Gare." The new material is stated to be at least equal, if not superior in quality, to the English article, while it can be sold at the rate of 60 cents to \$1.20 per hundred weight. This material, which is styled "Cement de Paris," or Paris cement, possesses, says the writer, durability and the cold appearance of marble, and a wall rendered, floated and set with it becomes impermeable to moisture. It can also be polished and made to present a beautiful appearance.

In describing the method of its manufacture, the writer observes that, in making cement, it has been generally found very difficult to obtain a thorough burning of every piece of clay or stone; sometimes the surface of it is burnt too much, and the center too little, or not at all. The result is that, after the clay or stone is crushed, it contains a considerable quantity of unburnt grains, which play the role of an inert material, and which people pay for as cement. In order to avoid this unequal burning, M. Vallin, instead of crushing the material after, does so before placing it in the kiln. A crushing mill breaks it into small pieces, which are automatically conveyed to a vertical cylinder mill, whence they issue ground to powder. This is in turn again automatically placed on sieves, which sift it into pans or kilns heated by gas. A series of inclined plates, having a gyratory motion, agitates the powder in each of the pans, and thus renders every particle of it amenable to the action of heat. Finally, a mechanical arrangement conveys it to sacks, which a man fills as the powder arrives. The whole operation is thus continuous and automatic, which of itself is a great advantage. But still more important and appreciable is the fact that all the particles of the cement are thoroughly burnt. M. Vallin estimates that his method enables him to effect a saving of about 30 per cent over those ordinarily adopted.

The writer concludes by stating that, besides the homogeneity of the particles, the other advantages of this cement, such as its great whiteness of color, durability, freedom from liability to unequal shrinkage (which causes fire cracks, etc.), are sure to secure for it the attention of contractors and builders.

**SOLDERING ALLOY.**—Glass, porcelain and other metals can be soldered by an alloy made as follows: Copper dust obtained by precipitation from a solution of the sulphate by means of zinc is put in a cast-iron or porcelain-lined mortar and mixed with strong sulphuric acid, specific gravity 1.85. From 20 to 30 or 36 parts of the dust are taken, according to the hardness desired. To the cake formed of acid and copper there is added, under constant stirring, 70 parts of mercury. When well mixed, the amalgam is carefully rinsed with warm water to remove all the acid, and then set aside to cool. In 10 or 12 hours it is hard enough to scratch tin. When required for use, it is to be heated so hot that when worked over and brayed in a mortar it becomes as soft as wax. In this ductile form it can be spread on any surface, to which it adheres with great tenacity when it gets cold and hard. It is intended for this alloy to be used to solder such articles as will not bear a high temperature.

**THE RISK OF CLEANING PICTURES.**—The question of picture-cleaning is one of the most complicated that can be, remarks the *New York Journal*. Suppose you leave a very dirty picture as it is, do you see, can you possibly see what the artist painted? Assuredly not. And why should decent people tolerate dirty pictures when they will not tolerate a dirty tablecloth? The answer is that if the picture could be cleaned as safely as the tablecloth it would be done without hesitation, but that cleaning may possibly remove light glazes and scrubblings along with the varnish, and that if these glazes, the finishing work of the artist, are once removed, no human being, except the artist who painted the picture, can replace them, says an acknowledged authority. But by the time a picture urgently wants cleaning, the painter has generally been for many years in his grave. Therefore, in having a picture cleaned you are risking that which cannot be replaced.

**PAPER ROOFING.**—A plan for rendering paper as tough as wood or leather has been recently introduced into Europe. It consists of mixing chloride of zinc with the pulp in the course of manufacture. It has been found that the greater the degree of concentration of the zinc solution, the greater will be the toughness of the paper. It can be used for making boxes, combs, for roofing and even for making boots.

**POWDERED ASBESTOS FOR COATING WALLS, ETC.**—Powdered asbestos can be used advantageously for making an enamel or coating for walls, pipes, etc. The powder is mixed with soluble salts, such as silicate of potash, and mineral or other colors which combine with silicate acid, so as to form a product which resists the action of oxygen, heat, cold or damp.

The coating furnishes a refractory glass which protects the material it is applied to, whether wood, gas or water pipes, and stone or brick buildings. When applied to masonry or wood, the surface of these is first washed with soap and water. In preparing the enamel the refuse asbestos only need be employed. It is also proposed to apply the coating to boilers, in order to protect the plates against a too intense fire.

**CINCHONAS IN CALIFORNIA.**—The *Stockton Independent* asks about the success of cinchona trees in California. Some interesting statements will be given, no doubt, in the forthcoming report of the College of Agriculture. The trees in the Garden of Economic Plants, in Berkeley, are growing well, but they are protected in winter. Young trees were sent out to various parts of the State where there was thought to be little or no frost, and probably some reports from the growers will be received in time for this year's report.

**THE BUSINESS COLLEGES** of the United States have within 20 years multiplied from a few institutions to several hundred, some of which have an annual registration of over 1000 students each. United States Commissioner Eaton reports a greater number of graduates from the business colleges than from the colleges of law, medicine and theology combined. Official reports show about 50,000 students during the past year.

**RAILWAY EXPANSION.**—In climates having a difference of 70 degrees in temperature between the hot and cold seasons, a railway track of 400 miles is 338 yards longer in summer than in winter. Of course the length of road remains the same, but expansion forces the metal closer together, making an aggregate closing up of space between the rails of nearly a yard in each mile.

**TO BRAZE IRON PIPES** first clean the split edges, covering with borax that has first been ground on a stone with water, and bind a piece of brass wire along the seam, with small iron wire wound around the pipe. Place the pipe in a charcoal fire, commencing at one end of the split, drawing the pipe through the fire as the brass melts.

**OLIVE OIL AS A LUBRICANT.**—Put pure olive oil into a clear glass bottle with strips of sheet lead and expose it to the sun for two or three weeks, then pour off the clear oil and the result is a lubricant which will neither gum nor corrode. It is used for watches and fine machinery of all kinds.

## GOOD HEALTH.

## Pure Air and Pure Water.

**EDITORS PRESS:**—For the last 8 or 10 years I have given the subject that heads this article a great deal of thought and study. I have read and studied with a great deal of interest every article that I have observed in such journals as the *Scientific American* and other valuable papers. I have often wondered why our leading papers do not publish more sanitary articles—more to enlighten the people on the subject of health, more in regard to the cause and cure of diseases. Comparatively how few of the people fully realize the importance of pure air to breathe and pure water to drink. The recent powerful microscopic lenses, in the hands of eminent scientists, both in this country and Europe, have led to some wonderful discoveries in regard to the causes of certain diseases. They have proven beyond a doubt that a certain order of bacilli does exist in certain diseases, for these same diseases have, by inoculation of the diseased blood into the blood of the lower order of animals, been produced. It is said, also, that these bacilli are found in the dust upon our walls, and that they exist most abundantly in filthy soils, foul air and bad water.

Years ago the prevailing theory was that the atmosphere became loaded with the miasmatic exhalations from some stagnant pool of water or the upturning of some hitherto uncultivated soil, and thus produced fever and ague. No doubt the air does become contaminated in this way, and persons in locating a residence should see that the prevailing winds do not lift this bad air into their dwellings. But equally important is to find out whether their well is furnishing pure, healthy water. How often is the well dug too near the privy vault or the cesspool, located in close proximity to the well, to save the expense of a few feet of sewer-pipe. Water to be good and wholesome should be thoroughly aerated. Hence, I should discard all bored or tubular wells. McAlpin, the greatest living water engineer, and perhaps the best authority in the world, says: "The smooth casing affords a most excellent conduit for surface water." I should prefer the old-fashioned dug well, walled up with brick or stone, imbedded in cement, and top open to admit the air, with a good tight curb resting on ground, well rounded up to prevent all surface water from running in.

Just here permit me to quote from the report of the New Hampshire Board of Health, "The History of a Rural Well."

"Let us examine one (or a thousand) of our grand old farm establishments of a hundred years' standing. Clustered on a few square rods of land are the farm buildings, the dwellings, the wood-shed, wash-house, horse-stable,

cow-barn, sheep-yard, swine-house, hen-house, corn-house, compost-heap, cesspool and privy. All these are arranged in a hollow square and in the midst is the farmer's well, with its curb, sweep and bucket, or its cover, pipe and pump. Around this center are concentrated all the activities of life upon a New England farm. Birth, life and death, bloom, fruit and decay of men and animals, of shrubs and trees, have transpired here for a century. All the waste has been dropped upon the surface, there to accumulate, decay and putrify. Then again, the bottom of the well, the very center of all these activities, must be at or below the level of the natural water basin in the immediate vicinity, and must rest upon or in clay, marl or rock impervious to water. The well is excavated through sand, gravel, drift or other earth pervious to water. All these conditions must exist or there can be no well. Let us picture the life upon these few square rods for 100 years.

"In and about these buildings live 300 creatures—men, beasts and birds. They are stabled here during winter, and yarded here during summer; here they take their daily food and drink, and discharge their daily waste. During 100 years there have been nearly 11,000,000 days of animal existence, all within draining and leaching distance of the source of water supply of the whole establishment. The amount of waste that cannot be removed by evaporation, drainage or absorption is enormous. The fact must be apparent to the most skeptical that the earth beneath farm buildings, stables, cesspools and privy vaults, and about wells near the same, is surcharged with animal and vegetable waste. This point must be conceded by all. It needs but a moment's attention to convince the dullest mind that every establishment with only the usual sanitary precautions is resting on and above a mass of most dangerous filth, and that this filth is being daily leached into the bottom of the well."

I quote again from the *Sanitary Era*. The typhoid fever epidemic at Waterford is attributed to the pollution of the water supplied to a public well, by the careless washing of the utensils of a sick-room near it. From this well 40 school children and others drank water, and soon showed symptoms of the dread disease. Physicians were called from Chicago, Milwaukee and other cities, but still the progress of the epidemic was not stayed. A genuine panic existed, and business was partially suspended. The State Board of Health has been investigating the situation.

The whole village of Plymouth, Penn., was poisoned, and many deaths occurred by drinking impure water.

The writer, when a young man, was living in Springfield, Ky., when the cholera suddenly made its appearance and many deaths occurred. The inhabitants fled to other localities. I well remember the bad quality of the water. The wells and springs were totally dried up in the daytime, and enough water would accumulate in the night to furnish a scanty supply during the day. No other town in the vicinity that had a good supply of wholesome water suffered from the epidemic. I have always attributed that scourge to bad water.

I have written the above that the readers of your valuable paper may have their attention directed to these two important factors that contribute to good health. One of our best physicians says when he is called to visit a case of typhoid fever or diphtheria he at once proceeds to investigate the surroundings, and he can generally trace the cause of the attack to a broken sewer-pipe underneath the house that vitiates the air, or to the cesspool too near the well that poisons the water. OCCASIONAL.

Santa Rosa, Sept. 20, 1886.

**AN ELECTRICAL CREMATORY.**—The latest novelty in cremation is an electrical crematory, in which, according to an American contemporary, the process of burning a corpse is carried out as follows: The body, being shrouded in sheets made of asbestos, is laid upon a frame consisting of fire-brick, while at the head and foot are large copper plates, to which the leads from specially constructed dynamos of high electro-motive force are attached. The body apparently occupies the position of the filament in an incandescent lamp, and, upon the current being passed through it, would be instantly carbonized; while, as the air would have free access to it, the process of destruction, or rather decomposition, would be immediate. The process appears to have the recommendation of great rapidity of action, and of freedom from many of the objections to cremation in the ordinary way.

**COURAGE IN DISEASE.**—Considering the physiological effects of courage, a prominent medical authority concludes that, contrary to a common notion, no effort of the will can check the development of hydrophobia. Courage is a powerful and not entirely understood remedial agent, but it cannot prevail against a germ disease that directly attacks the immediate vicinity of vital centers, the mere pin-pricking of which inevitably terminates in death.

**STUNG BY A SCORPION.**—V. H. Monday, a shepherd in Humboldt county, Nevada, the other day was stung by a scorpion on the back of his hand while in bed and asleep. The hand and arm swelled very badly and became quite painful. He went to Winnemucca, where he found medical attention, and is recovering.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**MOORE.**—Amador Ledger, Sept. 24: The prospects of this mine continue flattering. The north drift at the 500-foot level has encountered a splendid ore body. The ledge matter is said to be over 12 feet wide; some of it is of poor grade, but six feet of it is reported to be fine milling rock, and a streak of 18 inches wide is of high grade and shows abundance of free gold. We were shown a sample of this ore taken out last Monday. It is of a dark ribbon character and contains considerable free gold.

**MISCELLANEOUS.**—At the Kennedy the mill is being rushed along with surprising rapidity. It is expected to have it in running order by the first of October, and if this expectation is realized it will be the quickest instance of mill building that has been witnessed in Amador county. W. A. Nevills has purchased the claim of H. I. Bostwick, south of the Moore mine, for \$7000. The Zeile mill is expected to start up full blast about the first of next month. S. G. Spagnoli is negotiating for the erection of a five-stamp mill to operate a small quartz ledge at Clinton. The ore is apparently of a rebellious character, although it carries free gold visible to the naked eye.

**SUTTER CREEK.**—The work of cleaning up the old Eureka mill is being pushed ahead. The mortars are all out, and it is said there is a large amount of amalgam in the mortar blocks. The general opinion is that there will be in the neighborhood of from \$8000 to \$10,000 realized when the job is finished. At the Lincoln some inconvenience is experienced on account of the scarcity of water. During daytime 15 stamps are all that can be kept going. At night the water increases and they are enabled to run the mill to its full capacity.

**THE MCKAY MINE.**—Amador Dispatch, Sept. 24: The new company who have taken charge of the McKay or Etna mine near town are going ahead vigorously with their work, and evidently mean business. They have a shaft down now about 40 feet, and are putting up new hoisting works which will be run by water power. There can be but little doubt that this will prove to be a good mine when fully developed.

## El Dorado.

**DOGTOWN.**—Cor. El Dorado Republican, Sept. 23: J. M. Oxley has sold his claim to S. A. Lane and J. R. Fitzgerald for \$3000. Mr. Lane is an old resident of this county, and being a miner of experience and backed by Mr. Fitzgerald's ample capital, success is beyond a doubt. Jerry Kendall has got his claim in fine condition and is about ready for action. He can pan out enough for expenses while waiting for water. Oswald & Daveny have completed a fine ditch to their claim, and will open the eyes of the gold-dust buyers at their next cleanup. Alex. Marshall & Son are busy putting in flume and preparing for a winter's work. Henry Cox is fixing up for winter and is prospecting for a deposit of rich gravel believed by old miners to exist in the hill. He is so far encouraged that he intends now to start another tunnel lower down the hill for a siege. Wiley Sexton & Co. are repairing their ditch. They have some rich gravel on the dump. Jack Genini has found rich gravel on his stock ranch, for which he is offered a good price, but will not sell. Henson is busy repairing and making ditch, and has as good ground as any in the district. His ground adjoins the Oxley claim. We have the best placer-mining district in the county, as we are now about to prove. Several claims have been worked the past season and not one has failed to pay well.

## Mono.

**THE BULWER CON.**—Bodie Miner, Sept. 27: We cut the vein, mentioned in last week's letter as a new strike, and at this point there are two feet of ore assaying \$28. We have commenced the raise to connect with drift above. Most of the work done on the other levels during the past week has been in repairing and making preparations to get to the mill. Commenced taking ore to the mill yesterday, and will have everything in readiness to start the mill between Oct. 10th and 12th.

**THE STANDARD CON.**—Ore shipped to mill for week, 275 tons. Mill running steadily to full capacity of pans.

**THE BODIE.**—The upraise above the 700 is extended 9 feet. Have commenced to slope out ore preparatory to starting the mill. Have got some fair ore on the 800, but there is not enough work done as yet to say what it amounts to.

**THE MONO.**—We are taking out rich ore below the 700.

add Nev co

**HORSESHOE MINE.**—Grass Valley Union, Sept. 29: The shaft of the Horseshoe mine is down 180 feet, and the company is considering the propriety of letting another contract of 20 feet before commencing to drift. At present the ledge is four feet between walls, the quartz being of fine, lively appearance, and carries a good quality of sulphurets. With an increased depth the ledge is expected to be found more compact, as stringers going down give promise of that, and the drifting would then be carried on a strong vein and the backs would be more extensive. The stockholders in the Horseshoe feel greatly encouraged at the present appearance of the mine.

## Napa.

**HEAVY ORE SHIPMENT.**—Calistogan, Sept. 24: Grigsby & Johnson will soon commence shipping ore from their mine near Calistoga to the Selby Reduction Works, near Vallejo Junction. The first lot shipped will consist of 200 tons, which will very likely be followed by shipments of a much larger amount. The ore thus sent from the mine comprises that of the general dump, and not selected ore. We are told these shipments of ore do not indicate that the proprietors have abandoned the idea of erecting a quartz mill on their property. It was not the intention to send the ore away, and the proprietors of the mine would not now ship it if they did not receive very fair inducements at the Selby Works to do so, where the ore is now in demand.

## Nevada.

**MEADOW LAKE.**—Cor. Placer Herald, Sept. 25: Being interested to some extent in this district, I am here watching the developments now being made by Messrs. Arnold & Whittell upon the Excelsior mine, about three-fourths of a mile southwest of the town. The mine was selected from the fact that it was the best developed and had the best preserved portions of mill and machinery. If this proves valuable, there are doubtless scores of other veins in the district equally as good. Some time ago this mine was bonded for \$60,000, contingent upon the success of working the ore under a new process. A series of experiments were then entered into, which proved fully satisfactory. This season the old mill has been remodeled, and a large amount of new and expensive machinery attached. The work is far advanced. A force of about 20 men are engaged in the construction and in various employments about the mill. A large amount of ore is being mined and ready for crushing. A contract for several hundred cords of wood was let early in the season, and teams will arrive to-day to commence delivering both wood and ore to the mill. The expectation is to commence running in a week or so. The owners are here, seem to be practical men, are well satisfied, and are investing a large amount of money freely. From prospects obtained but a few days ago a new impulse was given to their faith, and they seem quite elated. I was told that so confident are they, that the money on the contract is ready. But there is no "boom" here whatever, though hundreds are waiting with feverish anxiety the result of this experiment; and should it be a success, another season will witness a lively scene. As near as can be ascertained, about 100 claims have been located, either by the parties interested themselves or by their hired agents, and there will be more yet, perhaps, this season. Within a few days I have taken some fine-looking ore from the Mohawk. Nearly all the mines that gave any promise of richness in the first place have been relocated. The season is too far advanced for any operations now, but should the attempt now being made to extract the gold prove a success, hundreds of claims will be worked next season, and sales will be made at high figures. Should the present attempt fail, there would be another setback to the mining industry here, and there are scores of claimants we should never hear of again. Yet the precious metal is surely here in immense bodies of ore, covering a district of many miles in extent, and science will surely be equal to the task of extracting it in a profitable way. Vast sums of money have been expended in the efforts to separate the base metal, which have failed. A pivotal point is again before us, and should the turn be on the negative side, the immense amount of mineral wealth stored here will doubtless remain unproductive for another period, whether brief or extended no one can tell. Yet, I repeat, there is no boom, no excitement here, save in the imagination of some enthusiasts outside; and there is no inducement to come here at present for business or employment, for there is none whatever.

**AN ALLEGED FAILURE.**—Transcript, Sept. 23: It is reported that the cleanup of the trial crushing recently made at the Boss quartz mine near San Juan, of which such great things have been printed and anticipated, was so small that it proved a severe disappointment to the stockholders. It is asserted that the amount of bullion realized did not pay for the extraction and milling of the ore. It is to be sincerely hoped that these statements are not well founded, and that the mine will prove a profitable investment for its owners; but if the rock does not carry enough gold to pay for mining it, now is the best time to ascertain the fact.

**MILL FOR THE NORTH STAR.**—Foothill Tidings, Sept. 21: A contract has been let by W. B. Bourn to the Risdon Iron Works of San Francisco, to construct for and at the North Star mine a 30-stamp mill, to build hoisting works and pumping machinery, to construct an iron pipe line which will convey water which will run all the machinery by water power at the North Star, the pipe to take the water from the Empire mine, a distance of about two miles. Every care has been taken to design the mill so that it will be economical to work. Several plans have been made and it is safe to say that the one finally decided upon will be superior to any design for a gold mill yet constructed in California. The mill will have a large ore chute above the main ore bins, and their combined capacity will be 2000 tons. The rooms for the battery and for the concentrators will be large enough to put in 10 more stamps. For the purpose of drying sulphurets, there will be a room about 40 feet square at one end of the concentrator room. There will be a room for cleaning-up purposes, and a large room for an air compressor, all in the one building with the mill. The ore will be run from the landing platform of the hoisting works across a bridge and into the mill, and the ore will be dumped on grizzlies, or screens, in such a manner that all the fine rock will go into the main bin, and the coarse rock will go to the rock-breakers, after which the rock will not have to be touched again. The battery iron work will be of a superior quality. The stamps will be 900 pounds each, and the mortars about 7000 pounds each. All the sluices will be of steel. There will be 12 Frue concentrators in the concentrator room. All the machinery will be driven by Pelton wheels. The building will be covered all over the sides with rustic, and the roof will be covered with No. 20 galvanized corrugated iron. It is expected that the mill and all the other machinery will be in operation by next Christmas. By the time all these improvements are made the expenditure involved will be about \$100,000, and the North Star will be one of the best equipped mines in the State. In the building (the house for the machinery) 350,000 feet of lumber will be used. The plans for this plant were drawn by Mr. W. B. C. Body and Mr. Connor, under the general direction of Mr. W. B. Bourn, with many valuable suggestions from Mr. John H. Hammond, the well-known mining engineer. The Risdon Iron Works owe their success in obtaining this large contract to the exertions of Mr. J. B. Pitchford, a mechanical engineer, who formerly resided in Grass Valley, and who is known all over the mining part of this coast as being in the front rank of his profession.

## Placer.

**DAMASCUS DISTRICT.**—Cor. Placer Republican, Sept. 24: This mining district is one of the oldest on the divide and is justly entitled to its reputation as one of the richest gold-bearing districts in the

county. The famous Mountain Gate mine, near the town of Damascus, has been a wonderful producer, over a million and a half of dollars having been taken out so far, and the recent rich strike in the east drift is additional and convincing proof of the hidden wealth which underlies this section of Placer county, awaiting only a judicious expenditure of capital and labor to develop it. A few miles north of Damascus, and on the opposite slope of the ridge at a place called Red Point, the French company have commenced work on their tunnel, which is now in over 400 feet, and is one of the best pieces of tunnel work to be seen in the State. They could not have picked out a better site for their camp than they have. Leaving the main road on the ridge, near the Forks house, you take the road built by the company, and descend by an easy grade to a level bench or shelf; here are located the company's office, boarding-house and engine-house. The hum of the machinery which drives the Burleigh drill, the merry ring of the blacksmith's hammer, and the bustle and activity of the different gangs of men, is a pleasant contrast to the solitude of the surrounding country. Work is continued night and day, and the tunnel is being driven forward at the rate of 75 to 85 feet a week; at this rate it will not be many months before the company reach the channel. William Jones has charge of the work, under the superintending engineer, C. H. Hoffman. The McIntire mine, owned by J. J. McIntire, is located about as far south of Damascus as the Red Point is to the north, and on the same divide. Their tunnel is also being driven in expectation of striking the same channel the Mountain Gate has, or one of its branches. Mr. McIntire started his first tunnel about a year ago, and ran in about 500 feet, when he struck rim gravel which would pay fair wages; passing through this for the more important channel ahead, he ran his tunnel about 200 feet further, and sunk on an incline 34 feet perpendicular, when they struck the blue gravel under five feet of clay, and got very fine prospects, which they were forced to abandon because the water drove them out. When they quit work in the upper tunnel, they were running east, the bedrock pitching in that direction, showing that they were on the west rim with the channel running north and south or nearly so. In July last, a new tunnel was commenced 82 feet lower than the first, which is now in about 200 feet, to which five feet is being added every 24 hours. It is estimated that a tunnel of 800 feet will bring them to the channel, to accomplish which every effort is being made. The gold found in the upper tunnel, a sample of which I was shown, is of high grade, and of similar character to that found in the Mountain Gate and other mines in the same district. There are other good mines in this district, such as the Sunny South, the Bob Lewis, and others which I did not have time to visit.

**GRAVEL.**—Cor. Placer Republican, Sept. 24: The Foss & Ballentine mine, near Iowa Hill, after running a bedrock tunnel of 400 feet, have struck a fine body of gravel which prospects well.

## San Diego.

**ERECTED THE MILL.**—Tucson Citizen, Sept. 23: Mr. J. Millar has returned from the Cargo Muchacho mining district, beyond Yuma, in San Diego county, where he has been for the past seven months putting up the mill for the Paymaster mine, of which Mr. Blaisdell is superintendent and manager. The mill is the old Esperanza mill from Oro Blanco, and it is now running its 10 stamps on ore that pays magnificently. The company runs two mines, the Paymaster and the Amelia. Shafts are down 200 feet on each, and a good body of fine ore is found in both. They are nearly 15 miles from the Colorado river, and the water is pumped this distance through a two-inch iron pipe laid on the top of the ground. The water coming through this pipe frequently reaches 142 degrees temperature, from the heat of the sun. The mill has been running for the past 30 days, and it turns out from \$15,000 to \$16,000 per month at a cost of not more than \$3500. The ore works to a higher percentage than samples of it went at San Francisco. The boss process is used and it works splendidly. The railroad station was formerly called Mesquite, and only a section-house had been built there. It is now called Glamis.

## Shasta.

**MILL RUNNING.**—Redding Free Press, Sept. 25: Hopping & Bell's mill at Old Diggings is now running smoothly on good rock. Day's mill in the same district is in full swing on very rich rock, and the entire concern will soon be out of debt. Prospects are decidedly bright for the entire district. Some very fine samples of coal have been brought into town recently by prospectors. A test was made one day last week by placing some of it in a clay pipe, then heating the pipe in a hot fire of chips. The gas escaping from the stem of the pipe was set afire and burned quite brightly. This coal was discovered near Mount Shasta on the line of the railroad.

## Sierra.

**YIELD.**—Mountain Messenger, Sept. 24: The American Hill quartz mine yielded \$8000 last month, and promises to do better this month. Mr. Lewis, of Forest City, has purchased the Leffel water-wheel, formerly used in the Good Hope mill, which was burned, and Harry Dickinson took it over to the quartz mine near the Cold Spring ranch, between Forest City and Pike City, this week.

**GOLD VALLEY.**—A few days ago I took a prospecting trip in the vicinity of Gold Valley, 12 or 14 miles northeast from Downieville. Mr. Helling's company has about 15 men fitting up and reopening the old mine, owned and patented by the Gray brothers, of San Francisco. The mine is now called the Empire. I found men putting up new buildings to replace those that were destroyed by fire some years ago, and the place seemed to be a lively camp. Men were in the woods getting out timbers, and wagons hauling lumber on the new road that has been constructed two miles in length to Van Slyke's sawmill. The miners were putting off blasts whose reports echoed out into the valley through the 70-foot air shaft which the miners have raised. They are making an effort to place the mine in working condition so that they will not be interrupted by the deep snow that falls in these regions. In this mine it is difficult to separate the gold in the ore from the base metals, but Mr. Helling is pretty sure, with the recent improvements, the great advance that has been made of late years in machinery, the discoveries in using chemicals, the cheapening of labor, provisions and material, together with the prospect ob-

tained from the ledge, that he can make it a thorough success, and he surely has the best wishes of all the enterprising men in the county. Mr. St. John is opening a ledge about a mile further up the valley in the west side of the mountain. He has built a large log cabin by the river and is making preparations to push the tunnel ahead during the winter. There has been a great deal of prospecting done in the vicinity of the valley during the past summer, and when a person thinks he has found a good place to try in, he is generally confronted by stakes and notices and the ground is claimed; but it shows that men are waking up to the possibilities of this part of Sierra county, and that something good may yet "come out of Nazareth." I think, in fact, that there is more quartz in sight in any direction around Downieville than here, and a better chance to prospect the ledges on account of a longer season and lower altitude; but in all my experience on gold fields, the chances always seem brighter to the miner the farther they are off.

**YOUNG AMERICA YIELDS.**—Sierra Tribune, Sept. 26: This dividend-paying property has produced during the last nine months as follows: January, \$14,645; February, \$30,174; March, \$29,129; April, \$27,395; May, \$22,722; June, \$22,856; July, \$38,568; August, \$34,400; total, \$229,489. The Young America, up to August, 1886, had paid eight dividends and have never levied an assessment. It recently completed a 40-stamp mill. Three new buildings are now in course of construction.

## Trinity.

**DEADWOOD.**—Cor. Trinity Journal, Sept. 24: I have just met Mr. Curt Blakemore passing through Deadwood on his way to San Francisco. From him we learn that the Venecia mine is blossoming out in good style, and that a lower tunnel calculated to be about 1100 feet in length is being run which will open their bonanza to a very reasonable depth. In reference to the mines on Deadwood I have nothing important to say. Every one appears to be happy and prosperous. Jos. Falan has opened on a vein about 200 feet from the old works which looks quite flattering. The ledge is about four feet in width, and ore recently worked paid \$50 per ton. Joe is now the "boss" of the mine condemned by other parties, and feels quite happy over the outlook. McDonald & Franck's new tunnel is in active progress under the management of Dick Roberts, who keeps everything neat as a pin. New sulphurets reduction works are being erected near the mouth of the south fork of Deadwood, and will be in operation in a few months.

## Tuolumne.

**STAR.**—Tuolumne Independent, Sept. 24: Geo. F. McPherson, of Calaveras, has disposed of his homestead property there for real estate in Oakland, and has located in Columbia. He will immediately proceed to develop the Star mine, on Rose creek, which was formerly very rich, \$200,000 having been taken out many years ago. Owing to litigation and other troubles, the mine has remained idle for years. Mr. McPherson hopes to bring the property up to its old reputation.

## NEVADA.

## Washoe District.

**CHOLLAR.**—Virginia Enterprise, Sept. 25: The increase of water coming in from Hale and Norcross has not interfered with work on the 3200 level. The main south lateral drift is being advanced, skirting along the east wall of the ore vein, and it is now 275 feet in length. The diamond drill hole, No. 8, being run by the Potosi Company, 550 feet south from the north Chollar line, has been discontinued for the present. The pumps in the Combination shaft have enough to do to keep the water down, including the extra amount tapped in the Hale and Norcross, and extra pumping facilities from the 3200 are being arranged.

**BEST AND BELCHER.**—On the 600 level crosscut No. 1 east, is in about 275 feet with its face in good-looking vein matter. The south lateral drift in the quartz vein east through by No. 1 west crosscut is progressing well, in good promising material. At the Osbiston shaft the old southwest drift is being cleaned out and repaired through the Gould and Curry to the Savage north line. The new three-compartment deep winze below the 2500 level is not yet decided upon or its location squarely defined as yet.

**HALE AND NORCROSS.**—On Wednesday morning a few inches increase of water was tapped in the north lateral drift on the 3200 level. It comes in from the roof and not the face of the drift, and may soon drain out. Meanwhile further advancement is suspended until pumping arrangements at the Combination shaft are completed for handling any further possible amount of water, which, however, is not feared nor anticipated.

**CROWN POINT AND BELCHER.**—About 200 tons per day of ore is being regularly extracted and shipped to the Santiago and Mexican mills on Carson river, for reduction. This production is likely to continue with the present and prospective stage of water in the river as motive power to the mills.

**SAVAGE.**—Ore is being hoisted from the extensive deposit developed on the 600 level, and further exploration work goes ahead at that point. The south drift on the 800 level, to intercept this vein, also goes ahead, but is not yet in far enough.

**ALTA.**—On the 700 level crosscutting has not been started, although it is intended to be within the next few days, at the north end in Lady Washington ground, in the west or Keystone ledge and in the main Alta ground.

**CON. CALIFORNIA AND VIRGINIA.**—Daily yield about the same—150 tons from the lower levels. Exploration and development work going ahead on the various levels as usual with no marked feature of improvement to report at present.

**SIERRA NEVADA.**—East crosscut No. 1, recently started on the 520 level near the face of the north lateral drift, is now in 121 feet. Face in a vein porphyry formation.

**KENTUCK.**—About 30 tons is the present daily yield, the reduced stage of water in the Carson river not admitting of more than that amount of ore being reduced at the Rock Point mill.

**GOULD AND CURRY.**—The crosscut from the upraise above the 450 level has been discontinued, and

a crosscut west, opposite to it, started. This is in very promising ground, with streaks of ore.

**OPHIR.**—On the 1300 level the north drift is progressing well in good working ground—total length, 432 feet.

**YELLOW JACKET.**—Daily yield continues to be about 100 tons, with prospect of increase, by reason of improved milling facilities.

**OCCIDENTAL.**—The upper and lower tunnels of the mine are being reopened, repaired and put in order for active ore extraction.

#### Garfield District.

**HEAVY MINING SALE.**—Lyon County Times, Sept. 23: Archie Farrington has sold his mines in Garfield District for \$575,000. He went through on last Saturday's train with the agent of the English company who bought the property. This sale does not include the interest Mr. Farrington has in the Lapanta mine.

#### Grantsville District.

**CHLORIDE ORE.**—Belmont Courier, Sept. 25: An extensive body of chloride ore has been struck in the upper workings of the Alexander mine, Grantsville. The ore is of a good grade and will be reduced in the mill under the direction of Thomas Mitchell, a millman better acquainted with the ores of that district than any one. Grantsville has now a good chance of seeing live times again, and as silver continues to advance John Phillips feels encouraged to push the work of development in various parts of the mine. This property is probably one of the largest mining propositions outside the Comstock in the State, and so far, nothing much outside of surface scratching has been done. The mines of Grantsville will produce millions on millions with proper management, and do it with profit to the owners.

#### Jefferson District.

**A RICH MINE.**—Belmont Courier, Sept. 25: Capitalists on the lookout for a good mining investment can find a rich mine in the Jefferson. All that is needed to make it a productive property is the judicious application of capital and labor. The Jefferson has paid dividends and will pay them again as soon as it is properly handled and opened. Ore that worked as high as \$5 a pound has been taken from this mine—and there is more of it left.

#### Ophir District.

**BULLION.**—Belmont Courier, Sept. 25: Work progresses steadily in the mine and mill at Ophir. The bullion output is regular and good.

#### Revelle District.

**NOT LIVELY.**—Belmont Courier, Sept. 25: Deputy District Attorney John Reynolds informs us that Revelle does not show its former lively appearance, such as it did when the mining industry was merely run for stock gambling. The Gila was well known all over the coast as a bullion and assessment producer. Times are different now, and the Gila is being worked for its mineral worth under the superintendence of Wm. Norris. There is a steady output of ore, principally from the upper levels; most of this ore is of a high grade. A deposit which is being worked at present is worth \$1000 per ton. That indefatigable worker, Geo. E. Clark, has a force of men at work preparing for the erection of a smelter for the reduction of ores from his base mine—the Cassius. Report says that the Cassius, which is situated at the south end of South Mountain, is capable of keeping the smelter at work on ore of sufficiently high grade in silver and lead to net a profit to the owner even at the present low price of silver.

#### Tuscarora District.

**BELLE ISLE.**—Tuscarora Times-Review, Sept. 25: Belle Isle and Navajo joint crosscut 150-foot level advanced 25 feet. The prospects are favorable for finding the May Queen vein at this point.

**NAVAJO.**—Commenced cutting out for winze between Nos. 4 and 5 crosscuts on the east vein, 350-foot level. At this point, on this level, we have a vein of rich ore that to all appearances will go down. A milling test, made on the last run, showed a value of \$308 per ton. Navajo and Belle Isle joint crosscut has been extended 25 feet in a very favorable formation.

**NORTH BELLE ISLE.**—Everything at the new shaft has been put in good running order. At the 150-foot level, the station has been completed and connected with the workings on that level. Work has been resumed at all points and some new work started since last report. Drift south on the vein from No. 1 crosscut has a width of about six feet, two of which will grade over \$300 per ton and the balance is of fair grade milling ore. On the 300-foot level everything will soon be ready for starting a couple of crosscuts. The force on the orehouse will be increased and it will be completed at as early a date as possible.

#### Union District.

**GOLD.**—Belmont Courier, Sept. 25: There are quite a number of gold prospects in Union Mining District that are worthy the attention of capitalists.

#### Wild Rose District.

**PARADISE VALLEY.**—Silver State, Sept. 28: For week ending Sept. 22d, milling ore produced 97 tons, 1800 pounds; shipping ore 13 tons, 1550 pounds. Total, 111 tons, 1350 pounds. Average assay value, per ton, 72.78 oz. silver, 0.39 oz. gold. Concentrations produced, 343 sacks, 29,720 pounds; par value \$6625.80. Mill run 192 hours; worked 144 tons. Number of men on payroll, 139. No. 2 level, north drift, face shows west wall and stringers of quartz, but no pay ore. We have connected south drift on No. 3 level with No. 1 winze, and are driving south from the winze. We will commence to sink engine shaft and open No. 4 tunnel as soon as possible. Everything is going along usually well and mill running steadily.

#### COLORADO.

**ORE.**—Georgetown Courier, Sept. 23: Solid ore has been opened up in the breast of the 600-foot adit on the Eclipse. The Coin lode is being worked by Dave Rockwell and sons with splendid results. A drift is being driven east on the Silver Cloud lode on a fair vein of ore, which mills from \$100 to \$250 a ton. The output of the Colorado Central mine for the month of August was 76 tons of ore, valued at \$20,517. Buckley & Powers, on the Chelsea Beach, have a very promising vein of ore which mills 200 ozs. silver per ton. Nichols & Co., on the Pelican

lode, have a very fair vein of ore, which, according to a recent millrun, returned 290 and 145 ozs. silver per ton, and 22 per cent lead. About 1000 tons of concentrating material from the Corry City mine is being treated at the Florence mill, and it is claimed with favorable results. M. Danison, lessee of the Schafter lode, in Hukill gulch, has opened up a streak of mineral, 20 inches wide, which yields 9 ozs. gold and 65 ozs. silver per ton, and 25 per cent lead. McKee & Co., lessees of the Lebanon tunnel property, have encountered a good streak of mineral in their workings. A recent millrun brought them about \$500.

#### DAKOTA.

**SILVER.**—Black Hills Tribune, Sept. 21: Four silver bricks came in from the Iron Hill yesterday, the weight of which aggregated 3750.90 ounces. A new strike of gold ore has lately been made on Two Bit. The West-Galena tunnel which is located on Two Bit is about to be extended another 100 feet. The new grappling machinery for the Black Hills Oil Company has arrived and will be sent out to the well at once. It is thought that the lost drill can quickly be recovered with the new machinery. Work is progressing on the Cheyenne mine. The mine was left in bad condition by the lessees, who gutted the richer chutes of ore, leaving the poorer though paying rock behind. Some men under the direction of Otto Grantz are now at work and are rapidly bringing something like system out of a badly mixed mess. The works were left in so bad a condition that a large run of surface rock fell in the cut, but the debris is now all removed, and a large body of good ore is now available. A very small force of men can now break down thousands of tons of good ore in a few days. Much galena has been found in the ore taken out in enlarging the cut and some of it carries bright grains of gold which are easily discerned by the unaided eye.

#### IDAHO.

**MINNIE MOORE.**—Bellevue Herald, Sept. 21: This mine, during the past six or eight months, has made a reputation for itself and the Wood River country that has, in one sense of the word, really redeemed Altares county, and the present prospects are sufficient to warrant the assertion that the mine has not yet been half uncovered.

**THE NEW STRIKE.**—Much excitement has been created in Bellevue the last few days by the reported strike of a large body of ore in the prospect owned and worked by the McWade brothers and Hugh Marwick, on the second mountain, just east of town, and only a mile and a half distant. A large number of visitors have been up to see the strike, and are very enthusiastic over its appearance. It is told that a gentleman here in the interests of Salt Lake parties made the owners an offer of \$5000 for the claim, but they refused, asking a higher price. This find proves of unusual interest to those in this vicinity, as much prospecting has been done on this side of the river in vain, and if the present find only proves permanent, it will set many a man to work on what are now idle claims.

**GALENA AND VICINITY.**—Ketchum Keystone, Sept. 25: Since November last, in the Senate mine, at Galena, a tunnel on the 400-foot level has been run 550 feet, with an upraise and shaft connecting the 750-foot level. This upraise and shaft are about 190 feet in all, making 740 feet development work in ten months. Fourteen men are now working for the company, and ore is rapidly being extracted. Waste dirt is carried down a chute for this distance of 190 feet, instead of being hoisted 85 feet, as formerly. Large reserves of stoping ground are now available, and the Senate is becoming a steady producer. The high-grade ore runs about \$150 per ton, and the low-grade about 30 to 50 ozs. silver, and 25 to 40 per cent lead. The smelter building is being altered into a concentrator, and this change will enable the company to profitably handle their low-grade ores, of which there are large amounts in the mine.

**ROCKY BAR.**—Keystone, Sept. 25: J. G. Kemp, VanEe, a London gentleman, representing the interests of the stockholders in the Alturas Gold Co., has been visiting the "Bar," and speaks highly both of the future of the company and the management of its mines by Superintendent Anthony. The building of the new 50-stamp mill is progressing as rapidly as possible, the hauling of machinery from Mountain Home taking up considerable time. Another 50-stamp mill is also contemplated, as the ore in sight in the Elmore is in such quantity as to necessitate at least 100 stamps being kept constantly at work. The company is also securing title to adjacent mines, and proposes to engage in mining on a scale unknown in the history of Rocky Bar.

**THE JOSEPHUS.** lying about five miles west of the Baldwin mountain, is owned by I. N. Daily, Sam Robinson, A. W. Wilson and W. M. Oster, and is the great find of the season as far as we are now advised. From the top showings this is really wonderful. It, like the other veins of this country, carries sulphurates and chlorides and lies in the formation usual to this part of Custer county. It has an immense body of float lying in exact line covering a space of about 20 feet in width and extending boldly nearly 1000 feet in length. Assays of the rock run 400 to 700 ounces.

**ATLANTA DISTRICT.**—J. P. Einsfeld, President of the Buffalo and Idaho Company, has been visiting its property during the past two weeks, and left Ketchum on Thursday for home. He is evidently well pleased with the outlook, and thinks the mines of his company can be made to pay very handsomely. At present the property is under bond to other parties, but should no sale be effected the company will take hold of the mines and begin active operations early next spring.

#### MONTANA.

**ANACONDA.**—Cor. Butte Inter-Mountain, Sept. 25: At present Anaconda is comparatively quiet, but the outlook is flattering for the near future, the people being assured that the works will start up by the middle of October. Our mines just west of this place are looking fine, and new prospects are being opened every day. Messrs. Sawtelle & Millen have been shipping ore from their mine at Foster gulch, that mills from \$350 to \$750 in silver per ton. This is one of the most substantial properties in Montana,

while a number of others bid fair to be equally as good.

**GRANITE DISTRICT.**—Helena Independent, Sept. 23: The Granite Mountain Co. has lately struck a new bonanza in level No. 5. This level worked through the original bonanza and worked for some time in barren ground. Now, however, a new body of ore has been struck that assays high and is of great extent. It has been crosscut in one place 18 feet wide and its limits have not yet been nearly defined. The Granite bonanza seems inexhaustible. The Revenue mine, at Richmond flat, Madison county, the sale of which was mentioned in these columns some days ago, is said to have been purchased by Eastern men at \$200,000. It is probable that another Helena company will be formed to operate in the Granite district. It is likely to be called the North Granite and the property supposed to be operated adjoins the Granite mountain.

#### NEW MEXICO.

**RUBY CAMP.**—Socorro Bulletin, Sept. 25: The Ruby mine continues to be worked under the management of J. S. Sniffen with satisfactory results. The Silver Gem makes a fine show of high-grade silver ore on the dump, in which occasionally appears free gold. Gen. Cook's sulphuret is showing up splendidly under the present development. Bryson is raising good mineral out of his claim north of the Ruby. Charley Adelman is delving energetically in his claim near the Bullion. The Oro Fino, south of the Ruby, is turning out shot gold and small nuggets. The Iron Mask continues to show gold in its two and a half foot quartz vein.

#### OREGON.

**QUARTZ AND PLACER.**—Jacksonville Times, Sept. 24: There is some talk of putting up a quartz mill in the vicinity of Gold Hill station. The work of cleaning out the Sterling Co.'s ditch and putting in new flumes is nearly completed. The quartz mill on the Hope ledge, in the Wagner creek district, is still busily at work on paying ore. L. D. Brown has several men engaged in putting his new quartz mill in position near the Swinden ledge. A number of residents of Ashland are on Cottonwood creek, Cal., prospecting for gold in the placer mines there. We learn that Patton & Co., who have a promising ledge on Wagner creek, intend putting up a quartz mill there soon. Bybee & Hall, of Canyon creek, have nearly finished their ditch, and will soon be prepared to make an extensive run. Miners are generally getting ready for the coming season. It seems as if more mining than ever will be done next winter. Messrs. Brown and Russ are opening a placer mine on Canyon creek, Josephine county, and will put hydraulic pipe and a giant on it before long. Naucke, Bybee & Co., who are inaugurating an extensive mining enterprise in Josephine county, will receive a lot of hydraulic pipe and a giant before long. Klippel, Baume & Co.'s new engine will soon be in position, as also the balance of their machinery. E. Ball, a scientific miner and machinist, is in charge of the work. We are informed that the California company, who are digging a ditch between Sucker creek and Illinois river, in Josephine county, have 30 men at work and are making rapid progress. They propose opening a large placer mine as soon as possible. Jas. Brown informs us that the Chinese company having failed to pay for Desselles & Connell's mine on Scotch gulch at the appointed time, those gentlemen have ejected them and sold their property to a company composed of Geo. Simmons, Chas. Decker, Thos. T. Gilmore and Peter Payne. Twenty thousand dollars was the consideration, which may be considered cheap, as it is one of the best placer claims in the State. A correspondent of the Times, writing from Glendale, says: "There has been an exceedingly rich strike made in the Green mountain ledge near here, at a distance in the tunnel of 125 feet. I saw 12 pounds of the ore, which was estimated to contain from \$1300 to \$1500, with 6000 or 8000 more lying in the tunnel. Besides, there is almost 200 tons of good milling ore on the dump. I have no doubt that is the best strike since Gold Hill on Rogue river. The people in this country don't seem to realize the richness of the mine."

#### UTAH.

**REVIEW.**—Salt Lake Tribune, Sept. 24: The week has been a heavy one in the shipment of ores, and the activity has been marked in our mining regions generally, the advance in silver having given great relief, though this advance is by no means what it ought to be; but it has given renewed hopes of yet further relief in the same line. The receipts of ore for the week ending Sept. 22d, inclusive, were of the value of \$97,737.62—an unusually heavy quantity. Since the shipments out were not heavy, it follows that the smelters must be absorbing very largely. The receipts of bullion for the same week were \$106,430.33. For the previous week the total receipts were \$160,235.14, of which \$114,793.56 was in bullion and \$15,441.58 was in ore. The Ontario product for the week was 12,694.57 ounces of fine bullion and \$23,669.62 from three lots of ore sold, a total, approximately, of \$36,364.19. One hundred shares of Ontario stock sold in New York on the 11th at \$25. The Daly product for the week was seven tons of fine bullion, 9473.88 ounces; no ore sales. There were received here during the week \$13,500 in gold bars; \$27,143.12 in fine silver bars, and \$19,800 in base bullion. The Stormont shipped up \$6690 in fine silver bars. The Hanauer smelter produced during the week \$23,061 in base bullion; the Germania, one ear, \$1702.99. There is nothing to report of the Horn Silver. Its operations (if it has any) are veiled in a dark cloud of secrecy. Ore receipts were \$45,342.19 by Wells, Fargo & Co.; \$40,552 (including \$4495 Queen of the Hills, \$3660 Overland, and \$8200 Crescent) by Wells, Fargo & Co.; and \$11,843.43 by T. R. Jones & Co.

**DETROIT DISTRICT.**—Cor. Salt Lake Tribune, Sept. 24: Detroit Mining District, Millard county, Utah, is 35 miles from Oasis, a station on the line of the Utah Central Railroad. Though the district is older, gold was not discovered here until about three years ago. Previous to that time the work done was on copper indications, trying to find silver mines, ignoring entirely and not testing the large veins of apparently barren quartz, because it had no copper stain. The veins are true fissures, large, and crop out boldly, thousands of tons of quartz lying on the surface, assaying from \$10 to \$30 in gold per

ton, and even more. The average value in gold of the ores of said district can safely be placed at \$15 per ton. The gold is free, and the ores, so far as examined, carry but a trifling amount of sulphurets. A few of the more prominent mines are the Marette, Cave, Golden Carrier, Ibex, Juno and Jupiter. The Marette is developed by one shaft to a depth of over 100 feet, and by several other openings not so deep. It is a very promising piece of property, and has produced some very fine ore averaging \$25 gold per ton. There is a large dump now on hand assaying over \$15 per ton. The gold here is free but very fine. The Cave is opened to a depth of 160 feet or more, and it is hard to place an estimate on the ore now in sight in this mine. The ore of this mine is softer than that of the former, and the gold in it is coarser, quite bright and free. The Golden Carrier is best described by saying it is a mountain of quartz. There is a large, bold vein of iron-stained quartz, and a sample taken across 25 feet or more lately tested, assayed over \$18 gold per ton. The Jupiter also is a very large vein and pans very nicely. The few claims here mentioned (and there are many more as good, if not better) have enough ore that can be quarried to run 50 stamps, or even 100 stamps, for years. Here are fortunes lying on top of the ground, awaiting the advent of capital and energy. Having stated the bright side, it is but fair to name the drawbacks. The camp has one serious drawback—that is, the absence of water. There is no water in the immediate vicinity of the mines. There is quite a large spring five miles in a north-westerly direction from the mines, but this water would hardly do for milling purposes on account of the sulphur contained therein. But, the same distance away from the mines, in a northeasterly direction, there is a depression on a little valley where I feel confident artesian water can be obtained at not more than 150 feet from the surface. Taking everything into consideration, it seems strange that capital has not found its way down there before now. Perhaps the district is too near home. The Marette Company are, so far, the only ones who have gone to work seriously. Thirteen miles west from the mines, where they own a large spring of crystal water, they have built a five-stamp gold mill of the free-milling pattern. It is their intention to work ores from the Marette and Cave mines, which mines contain quantities of ore that will assay over \$50 per ton. They deserve to make a grand success of their undertaking. The mill was running nicely when last seen. The mortar, stamps, engine and boiler are first-class, and were furnished by the Utah & Montana Machinery Company. The gold in some of the mines is, as stated above, very fine, and cannot be saved to advantage through the simple battery process and running the ore over copper plates, nor do I think that any of the patent arrangements would answer the purpose. Pans and settlers would answer were it not for the increased first cost of a plant and the heavy expense of running them.

**ALTA.**—Cor. Salt Lake Tribune, Sept. 25: Active overhauling the machinery of the New Emma mine is going on pending the arrival of the fine new pump from the East, which is expected here daily. Time, however, is not lost by shutting down the mine for the present, as the repairing and close looking after the steam pipes which is now going on is very necessary work, and will doubtless save the stoppage of operations hereafter. Operations at the Highland Chief have been actively carried on and a large quantity of high-grade ore has been extracted and got ready for shipment. The work in the Equitable mine is progressing rapidly. A good vein of ore was developed in that mine a few days since by the contractors. C. S. Harker, the manager of the McKay and Revolution Mining Company and Smelter, arrived yesterday for the purpose of looking after the property of the company here and to make arrangements for buying ore in order to start the smelter immediately. Superintendent Moses Hirschman has made all the necessary arrangements for soon starting the Eclipse mine. The work will be for the development of that on a larger scale. Work in the Flagstaff mine is being pressed forward with the greatest energy, and the rumor is current that a somewhat important strike of ore was made there last Saturday.

**PARK SHIPMENTS.**—Record, Sept. 27: For the week just ended the Mackintosh sampler received 444,530 pounds of Ontario ore, 27,740 pounds of Daly, and 25,510 pounds of Sampson ore; total, 497,780 pounds. During the week the Crescent shipped 158,700 pounds of concentrates. The Daly bullion product from the Marsac mill was 7 bars, on the 18th, containing 7504 fine ounces of silver, and on the 24th (yesterday) 7 bars containing 7656 fine silver ounces. On the 20th inst. the Ontario shipped 22 bars of bullion, containing 11,425 fine ounces of silver, and to-day the shipment was 27 bars, containing 14,579 fine ounces of silver.

**PARK CITY.**—Cor. Salt Lake Tribune, Sept. 18: Received at the McIntosh sampler for the week ending September 16th: Ontario ore, 460,180 lbs.; Daly ore, 49,020 lbs.; Sampson ore, 175,570 lbs. Bullion shipments: September 13th, Daly, seven bars, 7593 ounces. The Crescent concentrator is doing excellent work since the improvements have been made. They are turning out daily about 125 tons of ore. The tramway is bringing down about the same amount per day. The Marsac mill closed down on Wednesday for repairs, and it is expected it will start again in a few days. The mill has had a most successful run since it started, having turned out, up to this date, 269 bars of bullion.

**EUREKA DISTRICT.**—Cor. Salt Lake Tribune, Sept. 18: Eureka, which has been the scene of so much activity the past few months, is comparatively quiet just now. The two companies—Eureka and Beck—have done a large amount of work since they got into court. The mines have been developed faster than ever before, and the output has been larger. Both were taking out ore as fast as possible for a time, but when the court decided adverse to Beck, men were discharged and the output reduced. When Beck promised his hands last week to take the case to the highest court, it put a stop to the Eureka taking ore from disputed ground, if they had been doing so. It was only last week that some 70 men were discharged, but since then some of them have been put to work again, while the force at Beck's has also been lately increased. The Beck is down 420 feet, half of which is the work of the past ten months. From 80 to 100 men were employed up to one month ago, when the number was reduced to about 20; but they propose to soon have 70 men.

## Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveat filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government,

delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

### Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

### DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

### San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK. OR PACIFIC IRON WORKS, SAN FRANCISCO.

91 & 93 FRONT ST., PORTLAND, OREGON.

Ore Car, . . .	\$ 40.00
Rock Breaker, . . .	100.00
Quartz Mill, . . .	350.00

## THE JAMES QUARTZ MILL

Saves a Higher Percentage than any other machine.

Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the **WHOLE WEIGHT** and **FORCE OF BLOW** ACTS ALTERNATELY ON EACH DIE. In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

**STURTEVANT MILL.**

This Mill as a Crusher and Pulverizer is without rival.  
Is in operation in leading smelting works and mills.

## Foundry Notes.

The Pacific Rolling Mills are now quite busy and have about 500 men at work. They are just completing the Ninth street cable railroad, among other work on hand.

The Fulton Iron Works, Hinckley, Spiers & Hayes, is at work on engines and machinery for the new ferry steamer for the South Pacific Coast R. R. Co. The steamer itself will be built by the company. The engine is a "walking-beam," one of large size, and the boat will be about the same capacity as the *Bay City*. These works also built the machinery for the new Government dredger, just completed, for use on California rivers. We described this in detail at the time the contract was awarded. The hull of this dredger—70 feet long, 36 feet wide, and 8 feet deep—was built by Alexander Hay at the foot of Sixth street. The machinery was made at the Fulton. There are two 12x12 engines and two large boilers. The capacity of this dredge is supposed to be 2000 cubic yards per day. It is built in a most substantial manner, at a cost of about \$50,000.

There is no material change in the situation at the Pacific Nail Works in Oakland, the company still refusing to concede to the demands of the nailers. Labor organizations all over the State have adopted resolutions encouraging the strike.

The Union Iron Works has received plans of the five cruisers the Government is to build, and will bid upon them. It is greatly to be hoped that this firm will obtain a contract in this connection. They now have a plant suitable for work of this character, and with a few additions will have it complete in all details. We have had very little of the Government work to do on this coast—far less than we should have had. Vessels are built East and sent here at greatly enhanced expense. Now, however, that we have equal facilities for building, improved tools and all necessary appliances, we should be very glad to see our home industries encouraged by the Government. The Union Works have just made their first shipment of castings for the great dome of the Lick Observatory, which they are building.

The Wainwright Manufacturing Co., 65 and 67 Oliver street, Boston, Mass., and 98 Liberty street, N. Y. City, manufacturers of feed-water heaters, filters, expansion-joints, radiators and corrugated mining, have been forced, by their numerous orders, to enlarge their plant, and are erecting an addition to their factory at Medford, Mass., of four stories, 31x78 feet, which will contain machine shop and corrugating and radiator departments. Their former building has been utilized as a machine shop, having been moved to another site. By this change they will be enabled to increase their product some three or four times, and meet the demands of their business.

## Rural Health Retreat.

We take pleasure in again calling the attention of our readers to this popular resort and sanitarium. The original building has recently been thoroughly refitted, and the extensive additions are now complete. The rooms are well-furnished, ample and sunny, the gymnasium abundantly supplied with the most approved modern appliances for calisthenic exercises, and the bath-rooms are commodious, convenient and under competent management. The elegant and cosy cottages are admirably adapted to family use. Two thoroughly studied and well-experienced physicians, with two lady assistants, have charge of the medical and surgical departments. This retreat is kept open the year round, and its pure water, salubrious mountain air, fine walks and campus, and picturesque surroundings will ever make it a pleasant and inviting home, not only for invalids but for all who are in need of a few weeks' rest and recreation and surcease from toil.

The autumn season is one of rare beauty and enjoyment to the visitor and sojourner in the foothills of Napa valley. Its fine fruits, genial atmosphere and changing foliage add to its usual charms. There is no better season to induce the health and pleasure-seeker to tarry at this desirable resort.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

From 1865 to 1882 our production of pig iron increased from 931,582 tons to 5,178,122 tons.

CAMPO SECO, Calaveras county, presents a lively appearance on Saturday nights and Sundays, since work on the copper mines has commenced in earnest. The people in general in that vicinity are hopeful of better times.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING SEPT. 21, 1886.

- 349,295.—SASH-FASTENER—E. H. Alvord, Seattle, W. T.
- 349,299.—SAFETY AIR CLUTCH FOR ELEVATORS—H. W. Bracken, S. F.
- 349,479.—CABLE GRIP—H. Casebolt, S. F.
- 349,632.—TRACE HOOK—Chas. Dudley, Stockton, Cal.
- 349,489.—GAS METER—A. F. Fisher, Chico, Cal.
- 349,586.—CHECK VALVE—A. D. Glace, Rocklin, Cal.
- 349,498.—TRUSS—J. G. Henderson, Grizzly Flat, Cal.
- 349,650.—ELECTRIC SYNCHRONIZER FOR CLOCKS—M. E. Hunter, Oakland, Cal.
- 349,512.—ENGINE VALVE-GEAR—R. A. McLellan, S. F.
- 349,450.—FRUIT EVAPORATOR—A. C. Penniman, San Jose, Cal.
- 349,404.—MOLD-BOARD FOR PLOWS—J. W. Peters, John Adams, Cal.
- 349,459.—ADDING MACHINE—Shattuck & Thorn, Jr., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

AMERICAN NEWSPAPER ANNUAL.—N. W. Ayer & Son, of Philadelphia, have favored us with a copy of their "American Newspaper Annual" for 1886. It contains a carefully prepared list of all journals and periodicals published in the United States and Canada, corrected up to last July, giving their names, times of issue, general character (as political, agricultural, medical, etc.), age, size, circulation and advertising rates. These are arranged by States in alphabetical order, with a deal of other valuable information, compiled in handy form, and all made easy to refer to by table of contents and index. It makes a handsome octavo volume of over 1000 pages, and is altogether too convenient for editors and advertisers to be without.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
FRANK W. SMITH—Utah and Colorado.  
M. S. PRIME—Marin Co.  
W. J. TULLIS—Humboldt Co.  
Geo. McDOWELL—Fresno and Tulare Cos.  
O. F. BERGMAN—Tehama and Colusa Cos.  
S. S. LANTON—Nevada, Sierra and Plumas Cos.  
JEANNETTE HOUGHTON—San Mateo Co.

PROF. A. VAN DER NAILLEN, who has been sojourning at that delightful resort and sanitarium, the Rural Health Retreat, near St. Helena, in a brief letter, says: "Here I am and well contented. It is about the calmest and healthiest place I ever saw—Switzerland and Italy notwithstanding. They have a kind remembrance of you here, and of Dr. McKaig."

TACOMA, the western terminus of the Northern Pacific R. R., which in 1880 had a census population of 1098, now claims 9000 inhabitants.

## Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,  
252 Market Street, San Francisco.

## Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patschen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochuk's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quick-silver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DEWEY & CO., Publishers, 252 Market St.

## Acid-Proof Paint.

Among the meritorious exhibits at the Mechanics' Fair, to which was awarded a Silver Medal, is the display by the Paraffine Paint Company, whose main office is at 310 California street. The property which this paint possesses of resisting acids and chlorine gas, as well as defying the effect of long submersion in water, makes it of particular value in gold mills using the chlorine gas process, the tanks containing the solution being rendered watertight and impervious to the acid by its use. It has been adopted, among other places, at the Amador Reduction Works at Sutter Creek, and the Phoenix works at Drytown, Cal., where a variety of substances had been used without success. This paint is also used extensively in woolen mills for coating tanks and iron pipes in contact with acids.

FROM October 1, 1884, to July 1, 1886, the Tombstone mine yielded 27,875 tons ore, from which \$1,073,872 was extracted. The expenses were correspondingly large, so there was nothing left for stockholders.

## LUBRICATION.

Our readers can procure of CHARLES J. WOODBURY Manufacturer of Oils, 123 California St., San Francisco, a fine Lard Engine Oil, unsurpassed by any other Oil for general use, and which will flow through any feeder at all temperatures. Also, Cylinder Oils, Refined Cylinder Tallow, Lubric Compound, Farm, Machine, and strictly pure Lard Oil. The Woodbury Oils are in use on the Central, Southern, and Northern Pacific Railways, and nearly every Railroad and Steamship line on the coast.

## DIVIDEND NOTICE.

OFFICE OF THE

## Paradise Valley Mining Company

San Francisco, California.

At a meeting of the Board of Directors of the above-named company, held September 29, 1886, Dividend No. 9, of Twenty Cents (20c.) per share, was declared, payable on Thursday, the 30th day of September, 1886, at the office of the company.

W. LETTS OLIVER, Secretary.

OFFICE—No. 328 Montgomery Street, San Francisco, California.

## WANTED!

Man of Capital and Mining Experience to buy a number of claims, all in the hands of prospectors. Three Locations on same vein, 10-25 feet; formation, slate hanging, granite footwall; assays from \$10 to \$90 per ton in gold and silver, with a little copper in it. Can be opened and worked with tunnels to a depth from 400 to 2000 feet. Plenty of water and densely timbered. Title perfect. About 20 miles from N. P. R., Montana. No Reduction Works in the vicinity. Will bear close investigation. Great chance for practical mining men of some means. Price, \$30,000. For further particulars, address

J. W. LIND,

Marysville, Lewis &amp; Clarke Co., Montana.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & CO., Publishers, 252 Market St., San Francisco.

## Rural Health Retreat (Crystal Springs,) St. Helena, Cal.

Among the many delightful places for rest, recreation and restoration of mind and frame in California, is the "Crystal Springs Rural Health Retreat," shown in above engraving on this page. The Retreat is situated on the slope of Howell mountain, 1200 feet above tide level, 500 above and overlooking Napa valley, and two and a half miles from St. Helena, in Napa county. Among the natural advantages are stated: "Pure water, dry atmosphere, balmy sunshine, even temperature, mild breezes and the absence of high winds. Across the valley lies the Sonoma mountain range, breaking the sea breeze and shielding the Retreat from the chilling atmosphere of the coast, and presenting a safeguard against catarrh and lung diseases. The grandeur of its mountain ranges, with shrubby canyons lying in beauty at their feet, the famous Mt. St. Helena rearing its lofty head to the clouds, the grassy plain lying beneath, reflecting the sunbeams like a grand mirror before the Retreat, all perfumed with a variety of wild flowers, lend an enchantment to the scene. There are no stagnant pools or marshes within range; rainfall is plenteous, rendering irrigation unnecessary, and malaria is a stranger at the Retreat, and in all this beautiful valley. In fact, the purity of the air on this hillside and in the upper valley is a

specific for malaria, and all diseases affecting the head, throat and lungs, producing a healthy circulation through the mucous passages generally."

The Rural Health Retreat is twofold in its character. In the first place it undertakes to do direct work in the cure of diseases by hygienic and rational practice, by thoroughly competent physicians resident in the Retreat. While a radical table is furnished for invalids, and proper diet prescribed for each individual case, no one is confined to a starvation diet, and better and more ample variety is furnished at meals than is usually found upon invalid tables elsewhere. The managers have the services of two thoroughly competent physicians from Eastern cities of many years' experience in practice. They are assisted by two lady attendants having a two-years' course at one of the largest hygienic and surgical sanitariums in the world, with five years' subsequent practice.

The Retreat is also a summer and winter resort to all who desire to spend a few weeks or months in recreation, and receive the benefit from rest and breathing this mountain air, whose healthfulness and purity is unsurpassed. For such, a liberal table is especially provided. While the chief object of this institution is to afford a sanitarium for those in need of hygienic and surgical treatment, ample means are afforded for recreation, and entertainment is

provided for all boarders and pleasure-seekers who love decency and good order. Winding and picturesque roads, walls of blasted rock terracing the side-hills about the main building, cottages and driveways, a fine campus, spacious woods, shady groves, arched seats, swings, swinging rings, swinging chairs, will be furnished; dumb-bell and Indian club exercises given to such as may desire them. Calisthenic exercises will also be led by a competent leader. To accommodate their increasing patronage the proprietors have been enlarging and building quite extensively, and in many ways improving their facilities for making the Retreat yet more comfortable for their guests.

It is certainly one of the best sanitariums, all things considered, in the United States. We feel an especial interest in the Rural Health Retreat, because one of the proprietors of this paper, with his family, has greatly enjoyed a recreation season there. They assure us that they are exceedingly well pleased with the Retreat for its natural and added beauties and comforts, and for the pure moral tone, the kindness and cordiality which prevail in the management. The accessibility of the Retreat should also contribute to its desirability, both to the invalid and the pleasure-seeker. We advise health and pleasure-seekers to send for printed reports and further information.

JAMES LEFFEL'S  
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL &amp; CO.,

Chicago, Ill., and Denver, Col.

PARKE &amp; LACY, General Agents, San Francisco, Cal.

## DEWEY &amp; CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY.

W. B. EWER.

GEO. H. STRONG.

## A Good Opportunity for a Machinist.

A variety of good Tools, Patterns, etc., with business for sale cheap by a party retiring from business. A splendid opportunity for an enterprising mechanic.

Address A. B. O., care of this paper.

## WANTED.

To exchange one-half interest in three mining claims, in Montezuma District, Sonora, for a reasonable amount of money, to be used in developing said claims. One claim has paid a fair profit for over a year. The capture of Geronimo and band by Gen. Miles makes this the safest investment on this coast. For further particulars, address

J. E. BICKERTON,  
1069 Grove St., Oakland, Cal.

## REGISTRATION

—FOR THE—

## General Election.

All electors desiring to vote at the General Election, to be held November 2, 1886, must be registered regardless of any previous registration.

Registration for the General Election to be held November 2, 1886, will commence at the office of the Registrar of Voters, in the basement of New City Hall, on WEDNESDAY, August 4th, and will continue until MONDAY, October 11th, inclusive. Office hours, 9 o'clock A. M. to 5 P. M.

By order of the Board of Election Commissioners.

P. F. WALSH, Registrar.

August 1, 1886.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street

San Francisco, Cal.

THE CONSUMERS' COMPANY.

### VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.

218 California Street, San Francisco, Cal.

### THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**RANKIN, BRAYTON & CO.,**  
BUILDERS OF  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

## BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed. BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**  
**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## The Copper-Lined Furnace.

The first thing to displace the old adobe furnace for copper ores in the Clifton district, Ar., was the copper-lined furnace introduced in 1871. As might have been expected, the intense heat generated by the burning of coke in the copper-plate furnace proved too great for the copper plates, which were rapidly burned out, and this eventually led to the abandonment of the furnace and the substitution of the well-known type of copper water-jacket furnace now so extensively used. As a matter of interest, however, to copper smelters, we reproduce engravings of this copper-lined furnace, with a description which was read before the American Institute of Mining Engineers by A. F. Wendt.

In stopping up the holes burned by the corroding slag in the adobe lining of the small Mexican furnaces, a piece of copper was once accidentally used. It was noticed that instead of this copper melting, as was expected, it remained intact, the cooling action of the air being such that, notwithstanding the smelting going on at the face of the bar of copper, the bar itself did not melt. This led to the building of one of these small furnaces with copper-plate sides or walls, with the striking result that these plates, although reaching a red heat, failed to melt, and answered every purpose of a refractory furnace lining. Long campaigns could thereafter be made without trouble. If a plate of copper did melt out, it was simply charged into the furnace and run out as copper bullion, and the plates themselves were cast on the spot. Gradually the size of these copper-lined furnaces was increased, and a further improvement was made by building the bottom of crushed quartz, until the invention resulted in a furnace having a smelting capacity of 30 tons of ore per day.

This is shown in Figs. 1, 2 and 3, in which A is the body of the furnace, built of common red brick, and resting on two brick pillars at the rear, and two pillars, D, made of three short columns of cast copper, in front. The crucible of the furnace is built of an outer and an inner wall, B, of brick, between which clay is stamped. The bottom of the crucible is of crushed quartz stamped in place. On the inner brick wall rest the copper plates, C, which, as shown in the drawing, are made in sections and flanges, resting one upon the other. There are four tuyeres at the back of the furnace, supplied by blast from the blast-pipe, G. Canvas boots, E, connect the tuyeres with the nozzles of the blast-pipe. The front of the crucible is closed by an iron or copper plate, F, with a slag-lip and tapping-hole cut in it. The copper plates, C, if found to sag from the melting away of the lowest plate, were supported from the outside by bars of iron; and the bottom-plate, covering the front of the furnace directly over the cinder-notch, was cast in the shape of a box as shown in Fig. 3, and kept full of water. If there was a tendency of one side of the furnace to run too hot, a spray of water was thrown against that side, and it was rapidly cooled and brought to a normal condition. In running the furnace, the fuel was charged against the back wall and the ore to the front, and smelting was carried on with "noses." Charcoal was used for fuel, before the introduction of coke, and when coke was used the furnace burned out too quickly.

In Humboldt district, Arizona, chlorides are taking out a great deal of rich silver ore,

## Arizona Mines.

The first result, from a mining point of view, of the capture of the Apaches in Arizona is the preparation of plans for a new 160-stamp mill in this city for shipment to Arizona. For many years the advance of this Territory has been retarded by the Indian troubles, and for the past few years particularly the miners there have had hard times. Men with good "prospects" or good mines have been unable to work or sell them. Capitalists would not venture to put their money into mining schemes in a region where there was more or less danger to life and property. While the Indian difficulties by no

## Manganese.

Although several deposits of manganese ore are known on this coast, and a few have been worked in a desultory sort of manner, there is very little encouragement in this class of mining. A gentleman of this city, owning a deposit near the railroad line, recently went to work and got out 75 tons or more of this material, but when he had marketed it he found there was no profit to be made out of manganese ventures. And this is the experience of others also in this line.

It may be of interest to our readers to know that from an official report, lately issued, it ap-

FIG. 3.

Plan.

FIG. 1.

Side-view.

FIG. 2.

Front-view.

COPPER-LINED FURNACE.

means prevailed all over Arizona, outside people believed that they did, so the result was the same. The different camps have all felt the influence of this matter. The mining regions of Arizona are very extensive and rich, and in the future will attract much more attention than formerly. There is no reason, the Indian question being settled, why rapid development should not go on in all directions. There are plenty of opportunities to get good mines there. The miners themselves can now go to work with some sort of surety of making money.

Work has been discontinued in the Marysville Tunnel and Quartz Mining Company's mine at Timbuctoo, and will not be resumed until the arrival of machinery for crushing.

The Chicago M. & R. Co., at Ophir, are putting up a concentrator. This will enable them to work all of their low-grade ore, of which they have an almost inexhaustible supply.

pears that the production of manganese in Russia is steadily increasing. The exports for the first four months of this year amounted to 9000 tons, as against 4500 tons for the corresponding period of 1885. This is shipped principally from Poti, where it is conveyed by the Transcaucasian railway from the mines, in order not to interfere with the petroleum trade of the neighboring port of Batoum. Owing to the bad condition of the conveyance used in transporting it from the mines at Tchiatour to the Transcaucasian railway, large lumps of ore only can be carried, the result being that the smaller pieces, which are equal to two-thirds of the total quantity extracted, are wasted, although equal in quality to that exported.

Gold nuggets, varying from \$1 to \$10 in value, are alleged to have been recently panned out by a prospector from gravel obtained near the summit of "Old Baldy," a mountain peak near Pasadena, Los Angeles Co., Cal.

## The Mud and the Straw.

We have on our list of exchanges a great many newspapers, the most of them published in the mining regions of this coast, principally in California. In a majority of cases these papers are large, handsome sheets, neatly printed and ably edited, being filled with carefully written leaders, spicy news items and such other original matter as ought to find place in an enterprising and well-conducted journal.

But with all their excellences, many of these papers, we are constrained to say, are at times sadly deficient in mining news. Though published in the mineral regions, where their conductors have the best of opportunities for collecting full and reliable information in regard to the condition of the mines and for noting what is going on there, these papers come to us often with hardly an item pertaining to matters of this kind; not a word is said on the subject, or it is dismissed with a few brief paragraphs, as if it were of no importance to any class of their readers. Such is the dearth of mining intelligence in these, our exchanges, that in making up our weekly summary we have to glean over several hundred papers or more to fill the two pages of which this department consists.

We have before alluded to this subject in the columns of the Press, and now recur to it in the hope that our brethren in the mining districts, giving more heed to this our plaint, will see that there be less cause for it hereafter. That they should decline to write up worthless mines, or unduly magnify discoveries reported in their neighborhood, is much to be commended, and we hope to see no departure from this policy in the future. But, avoiding these mistakes, there is always enough of general concernment to be said about the mines and the various operations in every district, and which, appearing in the columns of the local paper, would interest readers both at home and abroad. Everybody likes information of this kind, it being highly acceptable to journals like the Press, that make mining a specialty.

Then the local editor should consider the benefits that may be expected to accrue to his constituency by having their mining properties noticed in a paper having such a wide distribution as ours. We issue a large edition of the Press, which circulates over a wide extent of territory, reaching capitalists and business men of all classes, not only in this, but to some extent also in foreign countries. But to obtain such notice we must ourselves be advised of the existence of such property through some trustworthy channel.

In writing on this subject on a former occasion, we likened our condition to that of the Hebrews in Egypt, who, when reminded that there was need for more building material, replied: "How shall we make bricks without straw?" We are in much the same fix as regards a constant want of matter for making up current mining news. If our mountain contemporaries will supply us with the needed information, we will undertake to produce, if not a first-class brick, at least a fair article of adobe. We will furnish the mud if they will furnish the straw.

DURING the month of September the Cortez mine shipped through Wells, Fargo & Co.'s office at Beowawe to San Francisco 25 bars of bullion, weighing 2631 pounds, valued at \$24,000.

### The Miners and Trees.

The San Francisco *Chronicle* advocates the renewal of the cultivation of forest trees, and favors an arbor day. It goes without saying, says the *Foothill Tidings*, that the *Chronicle* is able and practical generally in whatever it favors. But in one aspect of this tree business it has somehow become entirely wrong; and in this: the *Chronicle* wants a law passed to prevent the miners, among others named, from destroying timber, as if the miners wantonly caused or made that destruction. Our distinguished cotemporary ought to know that miners are tree planters and are very jealous of tree destruction. Grass Valley, for instance, is the largest gold-mining town in California, and perhaps in all the world. This town is filled with trees and all around in the vicinity are trees. The most of these are fruit trees, but there are a vast amount of timber and shade trees that are growing and that were planted and cultivated by men more or less interested in mining. Every miner here has his trees. In the matter of the young pines that grow up, the miner tries to guard them from destruction by fires. It is true that the miners use timbers to prop up the rocks so as to prevent caves that would kill men who are working underground, and who are taking out wealth for the world; but there is nothing wanton or wasteful in that use. The miners do not crowd wood into the mines merely for the sake of getting the trees off of the surface. On the contrary, the interest of the miners is to have trees grow. And in the mining belt of the Sierra Nevada the destruction of forests is not going on. It is above that belt where the sawmills are eating up the trees. This is done to get lumber for fencing the fields of the treeless wheat-growing plains and to supply boards for the making of packing boxes for fruits and other merchandise. The box-manufacturing mills at Truckee use more lumber in a month than do the mines of Grass Valley in a year. And the cities get some of the lumber of the Sierra Nevada. We do not doubt but that Mr. De Young's beautiful theater, the Alcazar, and his residence, both in San Francisco, have in them lumber made from the sugar pines of these mountains.

The miner has to have lumber for his house and wood for his warming fuel and to cook with, and he has to have timber to prevent his mine from collapsing; but all these wants need for their supply not a tithe of the lumber used by the farmers.

But it is a habit of late years for the San Francisco press to lay all disasters and wrongs on the miners. Probably the idea is, that the valley farmers are placated by blaming miners. That is quite a mistake. Neither farmers of the valleys nor business men of the cities want to see the great industry of mining stopped.

### Prospecting in Death Valley.

David L. Handley, for years a Nevada prospector, and one of the discoverers of some of the richest of the mines of the famous Comstock in that State, has arrived in Los Angeles from an extended prospecting trip to Death valley and the Panamint country.

Requested by a Los Angeles *Express* reporter to recite some of the results and incidents of his trip, Handley commenced by stating that during his journey in search of gold he had traversed the country east by north from Mojave to the borders of Panamint desert, which he crossed nearly two months ago. He prospected the desert from the northern to the southern border, and, as far as he could ascertain, half-way across. Unsuccessful on this search, he next sought Death valley, and after enduring untold hardships and privations he reached the valley on the first of August. The scene before the prospector as he reached the edge of the mesa overlooking the terrible valley, he says, is something beyond the power of man to describe. Destitution of even the scrub foliage of the desert, its sandy wastes stretching miles beyond to the mountains, the first sight of Death valley, Handley said, made an impression upon him that time can never efface.

Pushing boldly on, however, he had soon put four or five miles between him and the mesa, and camped for the night. Prospecting was in order next morning, and all day the search for "croppings" was continued, but without success. Handley states that he spent three weeks in the valley, penetrated it at least 60 miles, and traversed it from north to south from its borders to the hills. He regards the published recitals of the trio of prospectors, who claim to have unearthed vast mineral wealth in the valley, the purest of pure bosh, and states that, outside of some wealthy "pocket" placers, he saw during his stay in the valley not a single sign of quartz croppings or other indication of hidden riches. Handley, while disappointed in his mission, expresses himself as satisfied with his trip, and that an old-time belief in the mineral wealth of that desert country has been, with him at least, exploded.

CARSON MINT AS AN ASSAY OFFICE.—Acting Secretary Fairchild has authorized the reopening of the Mint at Carson, Nevada, as an assay office and for the receipt of deposits of bullion. This action was taken on the recommendation of the director of the Mint, and with the full

approval of the President. It is intended as an experiment, as it is said at the department that it is doubtful whether the deposits at the Mint will warrant even its being conducted as an assay office. Its future operations as a coinage mint will depend altogether upon the extent of its deposits.

### "Are We Dependent on Foreign Skilled Mechanics?"

The *Mechanical Engineer*, under the above head, after quoting from several of our leading technical journals extracts wherein those journals assert that we are keeping our own young men and would-be mechanics in the back-ground and importing skilled mechanics by thousands from Europe, thus placing ourselves in a position of dependence upon foreigners for skilled mechanics, denies the asserted fact as "stuff" and "nonsense" "scribbled in back rooms."

So far as our native mechanics are charged with lack of skill in designing machinery, etc., and their power to "create and construct" is called in question, the *Engineer* may be correct; but we do hold it as a fact that by the stringent rules of labor unions in regard to taking apprentices we are gradually depleting our shops of native skilled labor, thereby forcing our boys into idleness or into the overcrowded classes of employments where the unions do not interfere with the wishes of employers. This disposition on the part of our mechanics is already working great harm and is much to be deplored. But, as a general thing, American boys, when they do get into a shop, especially the better educated and better disposed portion of them, take readily to the work, make rapid progress, and are the ones who soon come to the front as "designers" and "creators." So long as even a very few of our native boys, brought up and educated here, whether of native or foreign-born parentage, are allowed to enter our machine shops and manufactories, we can depend upon a good supply of native mechanics to fill all the places where superior intelligence and skill are required, and we need have no fear that we shall ever become "dependent on foreign skilled mechanics."

The trouble chiefly complained of is that too large a portion of the ordinary positions in the shops are being filled by newcomers from abroad—not that the positions where special skill and genius are required are thus monopolized. Our cotemporary correctly says, and gives himself away in so saying, that our "machine shops are besieged with young men by the hundreds who want to learn the trade, but cannot get in because there are so many ahead of them. Ask any leading machine firm in the country if they have not a long list of applicants to learn the trade, and the reply will be as we have stated."

Why is it that these long lists of applicants have to be turned away? Is it not because of the overstringent rules of the unions, which keep down the number of apprentices below a reasonable figure, in order that the newcomers, with trades already learned, may be accommodated with work? Is it a reflection upon the good sense of our people that there is not a wider door opened for our own young men—our boys—to enter and obtain for themselves a trade by which they may be able to secure a good living for themselves, and support for a possible future family? The assertion of our cotemporary of the *Engineer* that our young men choose clerkships and other light work because they "think that honest labor, which soils their hands and makes their backs ache, disgraceful," and "that they ought to be poorly paid or not paid at all," is a libel upon the great numbers of boys in every manufacturing city in the Union, who make earnest application for opportunities to learn trades, and are refused "because there are so many ahead of them." Employers would gladly open their doors wider and admit a greater number of apprentices, if they could do so without coming in collision with their adult employees, who assume to say to their employers whom they may and whom they may not employ.

The *Scientific American* very truly says: "We are accustomed to believe that demand and supply regulate themselves, but in this very problem of the future of our boys we are brought face to face with a curious incongruity. We see on the one hand the overcrowded professions, and hosts of clerks who are ready to apply for any vacant position, however low the salary, while on the other hand we see a market for labor which is so far from being glutted that its supplies must be brought from foreign countries."

Every person of ordinary observation knows that the above remark is true to the letter, and yet our cotemporary refers to it in the following unjust and flippant manner: "Now what is the object of writing such stuff as this? \* \* \* If these writers were machinists or engineers out of a job, and would take a trip through the country trying to obtain one, at prices proportionate to their ability, they would learn some facts about the labor market that they will never get by reading exchanges and scribbling nonsense in back rooms." The question of employment for our young men and boys is of too serious a nature to be treated in such a trifling way, and it is truly "not the least of the counts against the unions that they stand resolutely in the way of young Americans, who wish to acquire knowledge of any craft."

### Local Cable Railroad Notes.

Work on the new cable railroad on Ninth street, from Market to Brannan, is being rapidly pushed forward, and it is expected that it will be in running order by the 15th. With the exception of about 200 feet between Mission and Howard streets, and one street-crossing, the roadbed is all completed, and the turntable and gearing for taking up the slack cable is in position on Brannan street. The whole work is being done in the most thorough and substantial manner. The cable tunnel is formed of concrete. The grips and rails are of steel manufactured in this city at the Pacific Rolling Mills. The latter weigh 40 pounds to the yard, and are of a peculiar pattern. They rest on yokes made of flat iron placed three feet apart, and instead of being spiked down as other rails, are held in place by malleable-iron clamps attached to the yokes, which are clinched firmly over the flange of the rail. The roadway the whole length between the tracks is paved with basalt blocks, the interstices between the blocks being filled in with cement. The residents of the lower part of the Mission, the Potrero and adjoining district, are eagerly looking forward to the completion of the road, which will give them the rapid means of entering the city of which they have so long stood in need.

#### Market-street Engine-house.

The offices and engine-house of the Market Street Railroad Company, situate at the junction of Valencia and Market, are at present undergoing an extensive system of improvements. The buildings of the corporation have been up to the present entirely composed of wood, and it is now intended to replace these structures by a more permanent and imposing edifice of brick. The construction at present in course of erection will consist of a solid red-brick building, with a frontage of 50 feet on Market street, and a depth running back at right angles to Mission street. The grounds to be covered by the new buildings are at present occupied by wooden sheds, where the steam and cable dummies used on the lines are located. The different workshops incidental to the establishment are here. The company's purpose in erecting the substantial buildings now in course of construction is not only stability and elegance of design but also security from fire. The frontage is to consist of an ornamental brick facade 50 feet in breadth, with a depth of 177 feet. The space in rear will be occupied by an engine-shed, two tightening-sheds, cable-rope manufacturing sheds, boiler-rooms and other necessary buildings. From foundation to roof the new edifice is to be fire-proof. The Market Street Cable Company have obtained a franchise to extend their line by Market-street cut to Seventeenth street. This enterprise will not, it is believed, be undertaken before the beginning of the new year. When the construction of the line will have been completed, steam dummies will be entirely dispensed with.

#### Clay-street Road.

The directors of the Clay-street Hill Railroad have seemingly at last aroused from their slumbers, says the *Bulletin*. The contemplated road down and up Washington and Jackson streets has probably caused them to realize the threatened destruction of their property unless they keep up with the progressive spirit of the age. The Clay-street road once took the lead in enterprises of cable character, but it lost since the post of honor, and has for a long while been far in the rear. The management will doubtless do a good thing by extending the road-bed to First avenue, as now intended. There is a good settlement to be tapped by the operation, which will more than likely increase somewhat rapidly when car facilities are available. But the company can do yet greater benefit to its stockholders and the public by carrying the line easterly from its present terminal point at Kearny away down to the water-front. It must be done some time, and the present occasion is about as acceptable as any, while the expense will probably be never lighter than now. While in the improvement and extension mood, the directors had better make a neat and clean job of it and put the line in such shape that it will both begin and end somewhere, so to speak.

#### The Powell-street Railroad.

From the apparent apathy of the owners of this important cross-town railroad, many people are beginning to believe that its existence will be on paper only, like other similar undertakings that might be named. It should be remembered, however, that most of the few stockholders are business men of repute, who cannot afford to have their good name tarnished by any kind of trickery, especially when public interests are so directly concerned. We know that considerable difficulty has been experienced in securing a site for engine purposes, and have never lost confidence in the ultimate carrying out of the project, as originally designed. The obstacle noted was overcome last week by the purchase of the vacant 50-vara lot on the north-west corner of Washington and Mason, and plans for carhouse and other necessary devices are being arranged. It is fair to assume that the construction of the road will be pushed with energy and capital, as both are well represented in the management of the concern.

It is stated that in Butte, Montana Territory, a new railroad company has been formed with sufficient capital to build lines to all the principal mining camps.

### "Snow-shoe Thompson."

In the *Overland Monthly* for October is an excellent sketch by Dan De Quille of that well-known California character, "Snow-shoe Thompson." From this we take the following paragraphs:

The most remarkable and most fearless of all our Pacific Coast mountaineers was John A. Thompson, popularly known as "Snow-shoe Thompson." For over 20 years he braved the winter storms, as both by day and by night he traversed the high Sierra. His name was the synonym of endurance and daring everywhere in the mountains, where he was well known and famous in all the camps and settlements. He was seldom seen in the valleys or any of the large towns, except Sacramento, as he only went when business called him. Notwithstanding that he seldom left his mountain home, there are but few persons of middle age on this side of the continent who have not heard of "Snow-shoe Thompson," or who have not in times past read an occasional paragraph in regard to some one of his many wonderful exploits. Before the completion of the Central Pacific Railroad, when he was regularly crossing the Sierra Nevada during the winter months, with the mails strapped upon his back, more was heard of him, through the newspapers and otherwise, than during the last few years of his life; yet every winter up to the last he lived, he was constantly performing feats that excited the wonder and admiration even of his neighbors and friends, though for years they had been familiar with his powers of endurance and his undaunted courage.

John A. Thompson, the man to whom the people of the Pacific Coast gave the name of "Snow-shoe Thompson," was born at Upper Tins, Prestjeld, Norway, April 30, 1827, and died at his ranch in Diamond valley, at the head of Carson valley, 30 miles south of Carson City, Nevada, May 15, 1876, after an illness of but a few days.

Mr. Thompson was a man of splendid physique, standing six feet in his stockings, and weighing 180 pounds.

Mr. Thompson came from Illinois to California in 1851, settling at Placerville, then known as Hangtown, afterward going to Putah Creek on a ranch. Early in the winter of 1856, while still at work on his Putah Creek ranch, Mr. Thompson read in the papers of the trouble experienced in getting the mails across the snowy summit of the Sierra Nevada mountains. At the time he was engaged in cutting wood on his ranch. What he heard and read of the difficulties encountered in the mountains, on account of the great depth of the snow, set him to thinking. When he was a boy, in Norway, snow-shoes were objects as familiar to him as ordinary shoes are to the children of other lands. He determined to make a pair of snow-shoes out of the oak timber he was engaged in splitting. Although he was but ten years of age at the time he left his native land, his recollections of the shoes he had seen there were in the main correct. Nevertheless, the shoes he then made were such as would, at the present day, be considered much too heavy and somewhat clumsy. They were ten feet in length, were four inches in width behind the part on which the feet rest, and in front were four inches and a quarter wide.

Having completed his snow-shoes to the best of his knowledge, Thompson at once set out for Placerville in order to make experiments with them. Placerville was not only his old mining camp, but was also the principal mountain town on the "Old Emigrant Road"—the road over which the mails were then carried. Being made out of green oak, Thompson's first shoes were very heavy. When he reached Placerville he put them upon a pair of scales and found that they weighed 25 pounds. They were ponderous affairs, but their owner was a man of giant strength, and he was too eager to be up and doing to lose time in making another pair out of lighter wood.

Stealing away to retired places near the town, Thompson spent several days in practicing on his snow-shoes. His whole soul was in the business, and he soon became so expert that he did not fear letting himself be seen in public on his snow-shoes. He was so much at home on them that he felt he should do no discredit to his native land.

When he made his first public appearance, he was already able to perform such feats as astonished all who beheld them. His were the first Norwegian snow-shoes ever seen in California.

Snow-shoe Thompson did not ride astride his guide-pole, nor trail it by his side in the snow, as is the practice of other snow-shoers, when descending a steep mountain, but held it horizontally before him after the manner of a tight-rope dancer. Having satisfied himself in regard to what he could do on his snow-shoes, he resolved to take the trail across the mountains, making his first trip in January, 1856. He went from Placerville to Carson Valley, some 90 miles. With the mail-bags strapped to his back, he glided over the fields of snow that were in some places from 30 to 50 feet in depth. Having successfully made the trip to Carson Valley and back to Placerville, Snow-shoe Thompson became a necessity and was soon a fixed necessity in the mountains. Through him was kept up the only land communication that there was in winter between the Atlantic States and California. But he never failed, no matter how wild the storms.

The loads that Snow-shoe Thompson carried

strapped upon his back would have broken down an ordinary man, though wearing common shoes and traveling on solid ground. The weight of the bags he carried was ordinarily from 60 to 80 pounds; but one winter, when he carried the mails for Chorpenning, his load often weighed over 100 pounds.

While traveling in the mountains, Snow-shoe Thompson never carried blankets, nor did he even wear an overcoat. The weight and bulk of such articles would have encumbered and discommoded him. Exercise kept him warm while traveling, and when encamped he always built a fire. He carried as little as possible besides the bags containing the mail. During the first year or two after he went into the business, he carried a revolver. Finding, however, that he had no use for such a weapon, and it being of the first importance to travel as light as possible, he presently concluded to leave his pistol at home.

All that he carried in the way of provisions was a small quantity of jerked beef, or dried sausage, and a few crackers or biscuits. He never carried provisions that required to be cooked. The food that he took into the mount-

nice in this respect as to carry with them dope for different hours of the day, using one quality in the morning, when the snow is frozen, and others later on, as the snow becomes soft. As Thompson used no dope, soft snow stuck to and so clogged his shoes that it was sometimes impossible for him to travel over it. Thus it frequently happened that he was obliged to halt for several hours during the day and resume his journey at night when a crust was frozen on the snow.

Snow-shoe's night camps—whenever the night was such as prevented him from pursuing his journey, or when it was necessary for him to obtain sleep—were generally made wherever he happened to be at the moment. He did not push forward to reach particular points, as springs or brooks. He was always able to substitute snow for water, without feeling any bad effect. He always tried, however, to find the stump of a dead pine at which to make his camp. After setting fire to the dry stump, he collected a quantity of fir or spruce boughs, with which he constructed a sort of rude couch or platform on the snow. Stretched upon his bed of boughs, with his feet to his fire,

winters, he never, in all that time, encountered a grizzly bear, nor even saw a bear of any kind. Hundreds of times, however, he saw their tracks in the snow, and also in the mud about springs and brooks.

If not the swiftest, it was universally conceded that, even up to the time of his death, Thompson was the most expert snow-shoe runner in the Sierra Nevada mountains. At Silver Mountain, Alpine county, California, in 1870, when he was 43 years of age, he ran a distance of 1600 feet in 21 seconds. There were many snow-shoers at that place, but in daring Thompson surpassed them all. Near the town was a big mountain, where the people of the place were wont to assemble on bright days in winter, to the number of two or three hundred. The ordinary snow-shoers would go part way up the mountain to where there was a bench, and then glide down a beaten path. This was too tame for Thompson. He would make a circuit of over a mile, and come out on the top of the mountain. When he appeared on the peak he would give one of his wild High-Sierra whoops, poise his balance-pole, and dart down the face of the mountain at light-

line will never be seen again. The times and conditions are passed and gone that called for men possessing the special qualifications that made him famous.

In connection with this biography of Snow-shoe Thompson, it may interest the readers of the Press to see a sketch of some snow-shoe racing in the Sierras. The engraving was made some years since from drawings made at a race in Plumas county. This winter sport is a favorite one in some of the mountain towns of California.

**SPEED OF MINING CAGES.**—In the course of a discussion this morning between miners, on the speed with which a miners' cage can be hoisted and lowered in a shaft, one of them said that the fastest time ever made in lowering was in the Union shaft. A cage with men was dropped from the surface to the 2900 level in one minute and 12 seconds. This was at the speed of a little more than 40 feet in a second, and slightly less than 30 miles an hour. On another occasion, when a shaft was flooded through the breaking of a pump, 63 tanks of water were

SNOWSHOE RACING IN THE SIERRA NEVADA MOUNTAINS, CALIFORNIA.

ains was all of a kind that could be eaten as he ran. For drink he caught up a handful of snow, or lay down for a moment and quaffed the water of some brook or spring. He never took with him brandy, whisky, or liquor of any kind. He was a man that seldom tasted liquor.

Snow-shoe never stopped for storms. He always set out on the day appointed, without regard to the weather, and he traveled by night as well as in the daytime. He pursued no regular path—in a trackless waste of snow there was no path to follow—but kept to a general route or course. By day he was guided by the trees and rocks, and by night looked to the stars, as does a mariner to his compass. With the places of many stars he was as familiar as ever was Hansteen, the great astronomer of the land of his birth.

At the time Thompson began snow-shoeing in the Sierras nothing was known of the mysteries of "dope," a preparation of pitch, tallow and other ingredients, which, being applied to the bottom of the shoes, enables the wearer to lightly glide over snow softened by the rays of the sun. Dope appears to have been a California discovery. It is made of different qualities and different degrees of hardness and softness. Each California snow-shoe runner has his "dope secret," or his "pet" dope, and some are so

and his head resting upon one of Uncle Sam's mail-bags, he slept as soundly as if occupying the best bed ever made; though, perhaps, beneath his couch there was a depth of from 10 to 30 feet of snow.

When unable to find a dry stump, he looked for a dead pine tree. He always selected a tree that had to it a decided lean. If he could avoid it he never made his camp beside a tree that was perfectly straight. For this there was a good reason. It very often happened that the tree set on fire in the evening was burned through and fell to the ground before morning. With a leaning tree he knew the safe side on which to make his bed.

At times, when traveling at night, Thompson was overtaken by blizzards, when the air would be so filled with snow, and the darkness so great, that he could not see to proceed. On such occasions he would get on top of some big rock, which the winds kept clear of snow, and there dance until daylight appeared; the lateness of the hour and the blinding storm preventing his making one of his usual camps. A certain notch or pass in the mountains was much "addicted" to blizzards, and at that point was a big, flat rock on which Thompson danced many a midnight jig.

Although Snow-shoe Thompson traveled through the wilds of Sierra for more than 20

ning speed, leaping all the terraces from top to bottom, and gliding far out on the level before halting.

Snow-shoe Thompson seldom performed any feat for the mere name and fame of doing a difficult and daring thing; yet W. P. Merrill, postmaster at Woodford, Alpine county, writes me as follows, in speaking of some of Thompson's achievements: "He at one time went back of Genoa, on a mountain, on his snow-shoes, and made a jump of 180 feet without a break." This seems almost incredible, but Mr. Merrill is a reliable man, and for many years Thompson was his near neighbor, and a regular customer at his store. Thompson doubtless made this fearful leap at a place where he would land in a great drift of soft snow. I spoke of this feat to Mr. C. P. Gregory, formerly Thompson's neighbor in the mountains, but at present a resident of Virginia City, Nevada, and he answered that although he had never heard of that particular leap, he did not doubt what Mr. Merrill said. "I know," said Mr. Gregory, "that at Silver Mountain he often made clear jumps of 50 and 60 feet."

John A. Thompson was the father of all the race of snow-shoers in the Sierra Nevada mountains; and in those mountains he was the pioneer of the pack train, stage coach and locomotive. On the Pacific Coast his equal in his peculiar

raised to the surface from the 1300 level in the space of one hour. During this time it was necessary for the cable in ascending and descending to travel 2600 feet in less than one minute, making a total of nearly 32 miles traveled in the hour.—*Virginia Chronicle*.

**AN IMPORTANT CASE.**—The case of the Chicago Mining Company vs. John Oliver, to quiet title to land on Gold Flat near Nevada City, which is being tried before the Superior Court, involves some important questions. In 1870 the Central Pacific Railroad Company got a patent to the land under an act of Congress passed in 1862. In 1879 a quartz location, including a surface area of 1500 by 600 feet, was made within its boundaries, and in 1884 a United States quartz patent was issued to the Chicago Company. It is the first time a case of this kind has come up in Nevada county, and perhaps this is the first one involving all the same points that has been tried in the State. Judge Sawyer has decided in the Circuit Court that a railroad patent is good against mineral claimants, but the Chicago Company claim there are other decisions to the contrary.

**A GOOD FLUX** for soldering iron, brass, etc., is made by dissolving chloride of zinc in alcohol.

#### Passing Events.

The gradual advance in the price of silver, after long-continued depression, is very gratifying to the silver miners on this coast. Many mines were on the point of closing down when the advance commenced. Now we hear of renewed efforts on all sides.

The statement that a new 160-stamp mill would shortly be built in this city for Arizona has interested many, as it shows that people were only waiting for a settlement of the Indian difficulties to put capital into Arizona enterprises.

Activity in California quartz mines continues, and shows an increase also. Good gold properties are in demand.

Reports have come to hand of rich diggings of gold in the Stickeen mines, British Columbia. These reports have been so often received, however, and then been contradicted, that little faith is placed in them this time.

THE San Diego Union says that R. W. Waterman has purchased the Stonewall mine, near Julian, San Diego county, for \$150,000. This mine lay idle and practically abandoned for several years until a short time since, but has been paying well of late.

#### Coming into Line.

California has aptly been termed a land of excesses and deficiencies—of contrasts and extremes. These peculiarities are inherent to her natural conditions. They are impressed upon her topography, her soil, her climate, and even upon the races that have in turn inhabited the country. Nearly the entire State is divided into tall mountains and wide extended plains. Rich and well-watered valleys are opposed by a vast expanse of dry and sandy deserts—a wonderful production offset by a frightful sterility. Heavily-timbered mountains look down on treeless wastes, while peaks that lift their heads into the region of perpetual frosts stand over chasms so steep-walled, narrow and deep that the rays of the sun never reach their bottoms. We have but two seasons—a wet and a dry—hot days and cool nights being a notable feature of our summer climate. Even the ethnology of the country is marked by the same contrariety. The aborigines were sensual, godless and grossly materialistic—mere animals, possessing so little of the religious idea that they failed to rise even to the dignity of idolaters. Their successors, the Catholic Fathers, were schoolmen, bred to the church, and wholly devoted to spiritual things. Following them came the people who now occupy the country—ambitious, grasping money-makers, as little like these God-serving priests as the root-digging Indian who first possessed the land. Of a truth, the dwellers in this strange region have been quite as antipodal as everything else pertaining to it.

But many of these dissimilarities that have so long distinguished California, her people and their occupations, are gradually disappearing. Gold mining, at first the almost exclusive pursuit, has given way to a great variety of other industries. Even the climate, under the influence of land culture and irrigation, seems to have changed perceptibly. Instead of importing almost everything we consume, we have become large exporters of many commodities, sending some to the very countries from which we formerly obtained our supplies. We export now not only the product of our mines but also mining machinery and occasionally a mining expert. We swap rich men with other countries, some of our millionaires going abroad to live and the millionaires of other lands coming here to sojourn and sometimes make permanent abode. And so it is, many things once considered characteristic of California are undergoing a change. Fruit and grape growing is beginning to encroach on the deserts, water is being carried into the dry places, and arboriculture practiced on the treeless plains. Our pursuits are being diversified and extended, and the too strong coloring of California life so toned down as to bring us into harmony with the rest of the world.

#### Coal at San Francisco.

The importance of this port as a coal market is constantly increasing. The collieries up the coast have increased their output largely within the past few years, and there is scarcely a day passes that a cargo of coal does not arrive. For several years steam colliers have been doing a great deal of work, but to cheapen the products, sailing vessels have been again substituted. As the mines are opened their product is increased. Moreover, the rapid settlement of the surrounding country and the facilities offered by new and extended railroads enlarge our market. Although a great deal of coal now goes to Wilmington (the port of Los Angeles) direct, our imports here are increasing. Vessels coming here for wheat cargoes always bring coal, as a ready market is found here. The largest single fleet of coal ships that ever arrived in San Francisco in one day came on Tuesday last. Their combined freight tonnage was greater than that of any fleet that has ever arrived here. Following is the list of vessels and the quantity of coal carried by each: From Newcastle, N. S. W.—British ships Stockbridge, 3000 tons; Lancaster Castle, 3200 tons; British Ambassador, 2400 tons; Forrest Hill, 3120 tons; Ben Cruachan, 1982 tons; Ardencaple, 2000 tons; Hospodar, 2450 tons; British bark Akaroa, 1440 tons. From Sydney—British ship Celestial Empire, 2000 tons; Wennestay, 2400 tons; British bark Star of Scotia, 1569 tons. From Sunderland—British bark Westward Ho, 1530 tons. From Tacoma—American bark Eliza S. Thayer, 1776 tons.

Total, 32,083 tons. The appearance of so many coal vessels in port caused much comment from persons along the water front.

#### Foundry Notes.

In the East the iron business is beginning to be quite lively again, and though we have not felt the influence of this change here very much, there are nevertheless more hopeful signs. For a long time past the business at the foundries has been dull and unusually so. There has been, of course, more or less job work, but heavy contracts, especially for mining machinery, have been scarce. It is stated now that a contract will shortly be let here for a 160-stamp mill to go to Arizona, and probably more machinery will go in that direction before long.

At the Rolling Mills they have some 500 men at work.

The Pacific Iron Works have been running a large force for some time past, turning out an unusual amount of mining work. Among the more prominent jobs may be mentioned a 20-stamp silver mill for the Bolanos Company, in Mexico, all made in sections for mule transportation; a 10-stamp silver mill for the Manzanita mine, in Colusa county; a 10-stamp gold mill, with Duncan concentrators and chlorination furnace, for the Foster Gold Mining Company, of British Columbia; a 10-stamp gold mill, with Duncan concentrators, for the Golden King mine, of Idaho; a 40-ton smelting tunnel for the Portland Smelting Works, Oregon; a 30-ton plant for Lima, Peru; pumping and hoisting works for the Garden Springs Company, of Arizona; a wire rope tramway for the American Syndicate Company, of Honduras. The 20-stamp mill of the Cunnigar Company, of Australia, has recently been equipped with Duncan concentrators, as also a 20-stamp mill in Honduras and three 10-stamp mills in South America.

The Risdon Iron Works are at present running to their full capacity on mills for different parts of California. Among others, they have contracted with W. B. Bourne to build and erect at the North Star mine, Grass Valley, a 30-stamp gold mill, complete in every respect. The mill is to be erected next to the present North Star hoisting works, and when completed will be a model in every respect. They have just shipped a 20-stamp mill to P. Bargion, Shingle Springs, El Dorado county, and expect to have it in operation in a few weeks. Elwin Benner has gone to put the mill up. An additional five-stamp mill for George Ives and others, complete with necessary steam power, has just been shipped to the same vicinity. A complete 30-stamp gold mill is being built and erected by the Risdon Iron Works at the Rathgeb mine, San Andreas, Calaveras county. This mill will be run by water power, and is expected to be in operation in about 30 days.

For some time past the Risdon Iron Works have been experimenting with a new "Bryan" ore crusher. They have built several, and have the highest indorsement from those who are using them. One is at present on exhibition, and those interested are invited to call and examine.

#### Drawing Lead from Smelting Furnaces.

As far back as 1871, W. S. Keyes and Albert Arents, both well-known mining men, invented and patented a method of tapping or withdrawing molten lead and other metals from a smelting furnace. A small basin, set beside the furnace, is connected by a tube with the furnace, so that as fast as the lead comes from the ore, it passes through the tube upward to the basin, where it is removed at will. This system has been almost universally adopted. In some cases the patentees have had difficulty in collecting the royalty charged for its use. They have had several years' fight with the Grant Smelting Co., of Denver, which uses 13 furnaces, to collect the royalty of \$250 a year per furnace. The case has been five years in the Supreme Court. Messrs. Keyes and Arents have finally triumphed, however, and last week received their money for the use of the patent from the company. These gentlemen have carried on the fight for their automatic tap patent themselves, and there are very few examples where inventors have done such a thing and succeeded in the end.

#### Academy of Sciences.

At the meeting of the California Academy of Sciences last Monday evening, President Davidson exhibited two phials containing small particles resembling a dark metallic dust, which fell from the air during the eruption of Pabloff (St. Paul) volcano on the Alaska peninsula. The volcano is situated in latitude 55° 26' and longitude 161° 50'. One of the specimens was gathered at the town of St. Paul, on Kodiak island, by Fred Sargent, of the United States Coast and Geodetic Survey, on a cruise for tidal observation. The other was gathered by Captain Carlee, of the Alaska Company's schooner *Kodiak*, off Choumagin island, and forwarded by the United States steamer engaged in the survey. A vessel that was in the vicinity of the eruption at the time it took place, which was in August, will arrive here in a few days and bring the particulars. The extent of area over which the dust fell may be partially inferred from the fact that the quantity contained in one of the phials was gathered at a distance of 335 miles from the volcano. Prof. Davidson said he had tested the powder with a fine magnet, and found that it took up every particle, and under the microscope he found that they had a metallic luster and that at least every one in 10 contained silica or quartz.

Capt. W. Churchill spoke of the correspondence recently noted in the customs of the savages of Melanesia and those on the northwest coast of North America. He spoke of the making of nets, bows and arrows, and the tattooing of the women.

Mrs. Mary K. Curran, curator of botany, presented several species of recently-collected plants.

Dr. H. W. Harkness exhibited a new fungus from Auburn; also specimens of larvæ of *Cades fly*, found on floating leaves.

Prof. Davidson spoke on the subject of "Submarine Valleys on this Coast." He exhibited a map and pointed out the location of a number of those valleys, ranging from 200 to 500 fathoms in depth. He said that a deep valley was lately discovered running into the shore between Point Gorda and Cape Mendocino. Its existence accounts for the loss of two ships off the coast, the cause of which was never definitely known. The captains of the vessels marked the soundings between the ridges of the valley. When they found 25 fathoms of water they thought that they were a considerable distance from land, and shortly after ran ashore.

The resignation of Vice-president J. P. Moore was received and accepted. Mr. Moore is now in the East.

#### A Roasting Furnace for Shasta County.

Robert Skinner and Capt. Geo. H. Atkins have purchased the right for Shasta county, and will immediately put up a Russell furnace at Redding for custom work. There is a vast amount of base ores in that vicinity, and thus will give owners a first-class chance to test their mines. The furnace in question has been practically tested at West Point, Calaveras county, and we gave an account of it some months since in the PRESS. It has also been worked in San Francisco. There is very little free-milling ore in that part of Shasta county where the new furnace will be put up. Most of the ore needs roasting before further treatment.

Messrs. Skinner and Atkins propose to roast and work the ore and make returns to mine-owners. The company to carry on the enterprise will be formed in Redding. The furnace will be of 10 tons capacity.

Mr. Skinner, whom we met this week, states that mining matters thereabouts look very encouraging, but there is no property there with ore that can be worked without roasting. Furnaces are absolutely necessary. This one will prove what can be done. Mr. Skinner gave us the following results accomplished by a Russell furnace in Colorado: The ore contained 5½ per cent of sulphide of iron, 1 per cent sulphide of lead, 6½ per cent of sulphide of zinc, 3 ounces of copper, 25 ounces of silver and 2 ounces of gold. They worked the silver up to 84 per cent, and gold to 87½ per cent, which was a higher percentage than had been before obtained by any other furnace. Mr. Skinner has great hopes that the new furnace project will largely advance the mining interests of Shasta county.

## Verbal Leases of Mines.

A decision of great interest to miners has been rendered in Department 1, in this city. In effect, the decision is that verbal leases of mines may be revoked at the lessor's will. The action was brought to perpetually enjoin defendants from extracting and removing gold from the mining claim of plaintiffs in Placer county.

Defendants had judgment, from which and from an order denying a new trial plaintiffs appeal.

The amended complaint avers that on the 28th day of August, 1883, the defendants entered into the tunnel which penetrates the mining claims in question and at a distance of about 2000 feet from its mouth began to dig the gold-bearing gravel and bedrock on the sides of the tunnel and to take gold therefrom; that plaintiffs required them to desist from so doing, which they refused to do; that they have continued such acts up to the time of the commencement of this action and threaten to so continue; that defendants are insolvent, etc.

The answer to the amended complaint denies all wrongful acts on the part of defendants and avers "that ever since about the 14th day of February, 1883, and down to and including the 1st day of September, 1883, these defendants were lawfully possessed of and were actually engaged in working and mining said part of said claim, pursuant to a contract and agreement between plaintiffs and themselves; and defendants aver that they still are and at all times since the 1st day of September have been entitled, under said contract and agreement, to continue the working of said part of said claim."

Defendants justify their acts under this contract, but do not plead it except to the extent and in the manner above quoted.

At the trial the defendants were permitted, against the objection of plaintiffs, to prove that plaintiffs and defendants entered into a verbal contract, by the terms of which defendants were permitted to enter upon, occupy and mine a portion of the Paragon mining claim, the property of plaintiffs, in consideration of the payment to plaintiffs by the defendants of one-fourth of the gross yield of gold to be derived from such mining. The objection to the evidence under which this verbal contract was established was based upon "the ground that no contract was pleaded in the answer, and no issue raised on any contract."

The court decides that the verbal contract of February 14, 1883, as found by the court and jury under which defendants were to enter and work a certain portion of the mine if they saw fit, and to exercise their own discretion whether they worked it or not, did not create the relation of landlord and tenant between them and the plaintiffs. The contract gave to them no greater right and had no more force in law than a verbal contract for the sale of the land would have possessed. Their right under such a contract was not in and to the realty, but to the gold as personalty where it should be severed from the land. Had it been in writing it would have given to defendants merely an incorporeal hereditament, and being verbal, it operated as a license to them to dig and mine for gold within the specified limits, which license protected them from a charge of trespass while in force, but was liable to revocation at the will of the licensors.

There is a broad distinction between a lease of a mine, under which the lessee enters into possession and takes an estate in the property, and a license to work the same mine.

In the latter case the licensee has no permanent interest, property or estate in the land itself, but only in the proceeds, and in such proceeds not as realty, but as personal property; and his possession, like that of an individual under a contract with the owner of land to cut timber or harvest a crop of potatoes thereon for a share of the proceeds, is the possession of the owner.

The agreement was revocable at the will of the plaintiffs, and having been by them revoked before suit was brought, plaintiffs were entitled to a recovery. For the reasons given in the foregoing opinion the judgment and order are reversed and cause remanded for a new trial, with leave to defendants to amend their answer if so advised.

THE Oro Fino mill near Calico produces about \$12,000 a month.

## Shaw's Disk Concentrator and Amalgamator.

We give on this page an engraving of Shaw's disk concentrator and amalgamator, which received a medal at the recent Mechanics' Fair. In this machine there is a circular copper dish in the shape of a very shallow cone with the apex turned downward, to which an eccentric motion of about one-half-inch throw is communicated by a vertical spindle, which is geared even to a light horizontal shaft running from 200 to 250 revolutions per minute. The disk does not revolve, being subject only to the eccentric motion, the result being the "panning motion," considered so desirable in all concentrating appliances. When in operation the movement of the concentrates is toward the center, where they are discharged by means of the tube or pipe shown in the engraving. The tailings escape over the periphery of the disk into a circular trough. This is inclined, and is adjustable so the discharging point can be brought to any desired position to lead off the tailings and water.

In order to assist or retard the motion of the pulp toward the periphery, a number of revolving radial arms are provided, to which are secured, at short intervals, small notched stirrers of sheet copper, which dip into the pulp to

Shaw's Disk Concentrator and Amalgamator.

within about a quarter of an inch of the face of the pan or disk. These revolving stirrers regulate the discharge of the pulp. They are set like wings, and can be adjusted at different angles so as to throw the pulp out more or less rapidly as desired.

The appearance of the machine is well shown in the engraving. The inventor claims that it is lighter, more simple and works more efficiently and rapidly than ordinary concentrators. It is not an expensive machine, and will save both fine and coarse sulphurets. It is of a capacity to take the pulp from a five-stamp mill with a 40 screen. The disk can be silvered so as to catch the free gold in the pulp. Two of these machines have recently been shipped to Cornucopia (Pine creek), in Oregon. When packed for shipment, each one weighs 750 pounds. Mr. S. W. Shaw, the inventor, is at No. 308 Phelan Block, Market street, in this city. He has a machine set up for work, and will be pleased to show it to mining men who are interested in this essential of a mining outfit.

## Mining Accidents.

Near Volcanoville, last week, Mike Callahan was killed while engaged in sinking a shaft to prospect a gravel bed. The shaft was about 75 feet deep, and the bottom covered with large boulders. As he was being lowered by his partner, Mr. Nichols, the spliced rope pulled apart and he fell a distance of some 50 feet upon the boulders, breaking his neck.

Mr. Frank Blake met with a severe accident while working in his quartz mine at West Point, in Calaveras county. A large rock, while being loosened, fell on his foot, mashing the toes so badly that they had to be amputated. It was nearly 36 hours after the accident before Mr. Blake arrived at the hospital.

A miner named Manuel had his right hand badly crushed at the Emerald mine, Tombstone. He caught his hand in the king-bolt of the cage, almost completely severing the forefinger and mangling the others in a terrible manner. His wound was properly dressed and he will doubtless recover speedily—minus one finger.

On the 6th inst., at Deadwood, D. T., a box of 30 pounds of giant powder exploded in the 300-foot level of the Caledonia mine, blowing four men to pieces and injuring five or six others. A spark from a pipe is said to have caused the explosion.

## Centrifugal Pumps and Draining Machinery.

[Written for the Press by J. RICHARDS.]

NUMBER 3.

## History of Centrifugal Pumps (Continued).

In 1845, Henry Bessemer, the great steel scientist of our day, invented and patented a centrifugal machine, or pump, mentioned in the first chapter.

It is not necessary to give drawings of this machine. It has simply a disk wheel, or "inclosed runner," as we now say in this country, revolving in a free chamber or casing; the discharge or tangential force of the water being neutralized and lost in the surrounding body or stratum. The writer has reason to understand these pumps, having himself gone through perhaps the same chain of experiments and reasoning 40 years later, but with a different result. The principle or method of operating was found applicable to high heads or high pressure, the loss of power being compensated in other ways.

The pumps of Mr. Bessemer were a kind of "roundabout" way of attaining a simple result, and contained some kind of a pneumatic attachment that we need not now trouble ourselves to even inquire about, and much less describe. The pump, aside from its last-named feature, which was no essential part of it, had been not only anticipated, but exceeded, by Blake's of 1831, which was a better and more simple machine, embodying all the operating features of its pretentious successor of 14 years later.

I am not at all astonished at Mr. Gwynne's resentment respecting the Bessemer pump or the Appold pump of Easton and Anderson. Both of them were in a sense "upstarts," as their subsequent history has proved.

We must, however, concede to Mr. Bessemer and no doubt to Easton and Anderson, also that they were in ignorance of what had been done in this country more than 30 years before.

In 1846, after the Andrews pump had been applied to a great variety of purposes in this country, it was improved and again patented both here and in England, Messrs. Gwynne & Co. acquiring the right for that country.

At this date we find the inclosed runner,

Fig. 6.—Inclosed Runner.

Fig. 6, which so nearly conforms to the modern form that its invention may with all fairness be ascribed to Mr. Andrews and claimed for this country. This is conceded by impartial English authority of six years later, and adds another to the claims made in the first section of these articles.

In the same year, 1846, Messrs. Von Schmidt, of New York, patented in this country a new modification of centrifugal pumps, an adaptation or change of the Andrews pump, but having no claims beyond its early date that need receive attention here.

A glance at the drawings of this pump will show that the theory of their action was then but little understood.

In 1848, two years later, we come to the celebrated Appold pump, and my first comment must be like that of Mrs. Trotwood—"Why celebrated?"

It was made by Messrs. Easton and Amos, now Easton and Anderson, of London, then and now very celebrated hydraulic engineers; but in so far as Appold's pump, the only new feature was the curved blades conforming to the Barker mill pumps that had preceded. Appold's first pumps had diagonal vanes set at an angle of 45° from a diametrical line. The want of novelty in this arrangement is sufficiently proved by the fact that no patent could be procured, and the importance of this form of vanes, as before remarked, is dependent on speed and pressure.

In some cases for low heads, where a pump's

work is performed by impact, or "mechanical push" it may be called, more than by centrifugal force, curved vanes of the Appold would not only lose their function but lower the efficiency.

The change of Appold's wheel or disk from a tapering section, with discharge orifice of narrow width, to one with parallel sides, shows that at least one of the main laws of hydraulics, a change of velocity without change of volume, was not known or disregarded.

On the whole, we are justified at this distance of time, when the merits of various methods have been demonstrated by experience, in concluding, as just intimated, that the reputation of the makers and the contest at the exhibition did more to make the Appold pump known than its working merits.

Subsequent tests, notably one at the Chatham dockyard in England and one at Trafalgar square, London, showed that however important the curved vanes might be, other features of the pump were bad or wanting.

Messrs. Easton and Anderson are, however, very able engineers, and as will be hereafter shown, have constructed some of the best and most efficient centrifugal plants known.

The fact is that the controversy of 1851, so often mentioned here, removed the pump matter from the field of engineering investigation to one of commercial contention. In respect to vanes, for example, there were at the time in England plenty of engineers and scientific men who could have developed from mathematical data the true and best form for pump vanes at different heads. It is true Prof. Rankine did define a form of vanes which did not give a good result under certain circumstances. I am speaking from memory, not having seen the drawings for some years past; but as now remembered, the professor's method was suited for low heads only, and no doubt his computations were correct, as all must be, if the premises are not mistaken I may also remark in respect to Appold's wheels that such deductions would not in any case produce vanes of a true curve such as are shown in drawings of his pumps made at the time.

We come next to Bessemer's second patent of 1849, a treatise it might be called on the general and special adaptations of Mr. Bessemer's pumps to various purposes. It has been before noticed, and can be explained by Fig. 2, which is typical of all the modifications.

I need not again remind the reader of Blake's pump of 1831. The analogy is so complete that the variation of a line or two would enable the same diagram to be employed for illustrating both machines.

The inventions of Mr. Gwynne, or rather his adaptation and introduction of American centrifugal pumps in England, form the next stage of our history and bring us to that period when the best methods of construction and adaptation were discovered and applied; the period also when, to Messrs. Gwynne's credit be it said, the workmanship on centrifugal pumps and the engines to operate them reached a perfection that perhaps no other branch of similar engineering work could at the time claim. It was also seen, by comparisons then possible, that Harvey's engines, employed to drain Haarlem lake, in Holland, could have been excelled in performance at one-half the investment had centrifugal pumps been employed for the same work. This branch of our subject will form a new chapter.

IRON is firm and in brisk demand everywhere excepting San Francisco, where it is very dull. A circular says: "Recent cable quotations from Great Britain show a marked advance in rails, scrap and pig iron. So far no difference is noticeable here, but it will be later on, as importers are not seeking orders for loading at former quotations. Foundrymen still complain of a want of orders, business generally being very quiet."

QUICKSILVER is firm. The exports from this port by sea from January 1st to October 1st were 5513 flasks, against 11,439 in the same time last year, and 12,490 in 1884. The exports by rail up to September were 1815 flasks.

RECEIPTS of coal at this port during the first three quarters of the year were 636,200 tons, against 691,600 in the same time last year. The market is quiet and well stocked, while supplies on the way here are heavy.

## MECHANICAL PROGRESS.

## Mechanical Wiseacres.

At regular and frequent intervals some mechanical wiseacre makes, in his imagination, the alarming discovery that there is a constant falling off in mechanical skill; that mechanics 30 years ago were much more competent than they are to-day, and that in this respect things are getting altogether bad. There is never an atom of evidence going to show that there is any truth in this statement, but a good many well-meaning men believe it, and proceed to set up ingenious theories to account for the assumed fact. Of all statements that receive almost universal credence, this is by odds the most stupid. Thirty years ago it was comparatively rare to find mechanics who knew more about the trades they followed than was required to enable them to use the tools they worked with. When there was one who studied beyond this he stood out phenomenally, by contrast. At the present time all mechanics study the literature relating to their trade, and many of them are close students of the principles of mechanics. But methods have been changed in 30 years, and a good deal of work that was done then by skilled workmen is now done by those who do not pretend, or at least more than pretend, to be mechanics. Machinery which requires only the attention of a small amount of special skill is made to do much of the drudgery formerly done by the mechanic, hence it is common to find a good many men working in the trades but not at the trades. These are ranked by the superficial thinker as mechanics, and compared with those of the "old times." The mechanic of to-day who has learned his trade is, as he should be with the advantages of better facilities and immensely better opportunities for reading and studying in the proper direction, much better able to follow it intelligently than he would have been 30 years ago.

It would be just as reasonable, and quite as correct, to argue that business men were less proficient now than formerly, because they have come to make use of specialists in various departments of business; men who make no pretensions to an understanding of more than the particular part they do. But no one would believe this.

Akin to the wiseacre who sees ruin in the waning abilities of the mechanic is the one who, seeing things quite differently, but equally falsely, evolves the conclusion that machinery has done away with the need of skilled mechanics. Skill of a high order was never more in demand.

As we have at different times pointed out, there is danger that a disinclination on the part of manufacturers to take apprentices may make the supply of the right kind of mechanics scarce, but then the demand for them will be still greater. In any event, they will be more skillful year by year as long as the world continues to grow wiser.—*American Machinist.*

**RIVET HOLES IN BOILER-PLATE.**—In a report made by a committee of English master-mechanics, it appears that a large majority of railway master-mechanics advise drilling boiler-plate instead of punching. The committee made the following tests, all the pieces being from the same sheet of five-sixteenths-inch boiler-plate, and of one and three-fourths inch width. Three pieces were torn in two by hydraulic pressure at an average strain of 32,685 pounds; three pieces punched, one five-eighths-inch hole in each piece, broke under an average tensile strain of 13,485 pounds; three pieces drilled one five-eighths-inch hole in each, broke under an average tensile strain of 17,645 pounds. The average strength of the drilled plate was then 4160 pounds greater than that of the punched plate. Three pairs of plates, punched and riveted with the best five-eighths-inch rivets, one rivet to each pair, broke in the center line of hole at an average strain of 17,549 pounds, and three pairs of plates drilled and riveted in the same way sheared the rivet at an average strain of 16,342 pounds. It is not regarded as probable by this committee that the tensile strength of the boiler-plate, per sectional square inch, is impaired by drilling, but they are satisfied that it is impaired by punching; they therefore recommend drilling and the use of one-third-inch rivets.

**ON CASTING STEEL.**—A practical steelmaker writes to a foreign paper as follows: "Every steelmaker will admit the desirability of allowing the metal to stand in the ladle as long as possible before casting, and then casting as slowly as possible. I have always found that the slower the ingot has been cast and cooled the better it has worked under the hammer, and the greater the ductility of the test-pieces, to say nothing of the greater soundness of the ingots and consequent saving in the amount of scrap produced."

**A NEW PROCESS OF WELDING STEEL.**—Mr. E. D. Wassell, of this city, has invented a new process of welding steel, by which steel bars of any content of carbon can be piled and welded together. He has demonstrated this by making a homogeneous weld of a pile made of bars containing 65 points of carbon. The process is not applicable to bars alone, but any miscellaneous steel scraps may be put up in fagot form and welded in the same manner by the rolling process. Another feature of this method is that

the carbon can be reduced to any point desired; that is to say, steel of 65 points can be reduced to 10 points in carbon while in the solid form without remelting. The process will cover the working of old rails and old steel scrap. The great usefulness of the invention consists in that piles can be welded from which plates can be made as large as 10x4 feet, and thus, it is claimed, the method will cover the whole agricultural field and like branches of the steel industry.

**CRACKING OF CYLINDERS IN LARGE ENGINES.**—A correspondent of the *London Engineer* asserts that the chief cause of cracked cylinders in large engines is starting the engines too soon. In large ships, he says, the steam can be got up in an hour in the boilers, but the engines should, as a rule, have from two to four hours to warm the cylinders, so that the metal will have no undue strain on it through unequal expansion when starting—sometimes they get it, and at other times not. When the steam is up, and just when the cylinders are warmed enough to put the inner ring of metal in a state of compression, and the outer one in a state of tension, the engines are started at a speed quick enough to bring over a few buckets of water from the boilers, there are a few bangs and bumps, and then everything appears to be all right; but some time after, when the cylinders are opened, there is a crack found in one. Again, some of the cylinders in the merchant service, according to this writer, are very large, but they receive quite another sort of treatment; steam is up from four to six hours before starting, and when they do start there is no stopping, with few exceptions, till the ship gets in port again.

**STRENGTH OF CAST IRON.**—No considerable strength in large iron castings can be calculated on unless they cool, after pouring, slowly and in such a manner as not to leave them subject to much internal strain. Where there is any considerable internal strain a large casting may be broken into many pieces from a blow with a small hammer or even a sudden jar. Some years ago some bridge girders were cast at the Tinsley Park Works, near London, England. Several of these girders were broken in cooling. The patterns were then changed a little so as to more thoroughly equalize the cooling. Still, one out of every six broke on cooling. At last six girders that were considered perfect were sent out, every one of which soon afterward broke from the jar of heavy thunder in a single storm. Cast-iron boilers have been known to crack after a heavy peal of thunder. These facts were made public on no less an authority than that of Zera Colburn. Of course, improper conditions of cooling were the cause in each instance.

**SMOKE BURNING NOT ECONOMICAL.**—There is little doubt, says Prof. Lodge, but that the experience of many engineers and manufacturers is hostile to the complete combustion of fuel—technically called the consumption of smoke—regarded from the point of view of economy. In boiler fires it is continually found that as smoke is consumed, so is the output of steam decreased; and, so long as this is the case, it is hopeless to expect the non-emission of smoke from boiler fires, except under very severe penalties, which the community would be very loath to exact. In high-temperature furnaces, experience of smoke consumption is far less discouraging, and there are not wanting manufacturers to assert, on apparently good grounds, that they effect some 40 or 50 per cent economy in coal now that they adopt a more perfect system of firing.

**SKILL WITH THE HAMMER.**—In an interesting article in the *Industrial American*, Mr. Joshua Rose calls attention to the usefulness of the hammer, and the many departments of work in which it is necessary to perfection of output. "I know a man," says Mr. Rose, "who was paid \$50 a week for his skill in using a hammer, and I have seen a man use a hammer to make work straighter than the finest and most delicate tools had been able to do."

**A NEW TELEGRAPH WIRE.**—As is generally known, compound telegraph wires consist of copper deposited upon iron and steel. A wire, however, is now being brought out in England in which the relation of the two metals is reversed, the steel surrounding the copper. The wire is said to be drawn from compound metal consisting of a hollow ingot of steel filled with copper.

**WIRE OR FIBROUS NAILS** are coming into use, and are claimed to be, in some respects, quite an improvement upon the ordinary cut nail, especially on the score of tenacity. They are not only tough but stiff, and will penetrate hard wood, where cut nails would break sharply off or become badly crooked.

A REASON why steel will not weld as readily as wrought iron is that it is not partially composed of cinder, as seems to be the case with wrought iron, which assists in forming a fusible alloy with the scale of oxidation formed on the surface of the iron in the furnace.

A MANCHESTER, ENGLAND, firm has just made the largest locomotive frame-slotting machine ever turned out. The bed is 30 feet long, 5 feet wide, and will weigh 60 tons. It has improved arrangements for driving. It is attracting the general attention of engineers.

## SCIENTIFIC PROGRESS.

A NEW ATTACHMENT to the microscope has been devised, the object of which is to observe the melting points of minerals while under the process of examination. The device is called a "meldometer," from the Greek word *meldein*, to melt. It consists of an adjunct to the mineralogical microscope, whereby the melting points of minerals may be compared or approximately determined and their behavior watched at high temperatures, either alone or in the presence of reagents. It consists of a narrow ribbon of platinum, 2 mm. wide, arranged to traverse the field of the microscope. The ribbon, clamped so as to be readily renewable, passes bridgewise over a little scooped-out hollow in a disk of ebony. The clamps also take wires from a battery, and an adjustable resistance being placed in circuit, the strip can be thus raised in temperature up to the melting point of platinum. The disk being placed on the stage of the microscope, the platinum strip is brought into the field of a one-inch objective, protected by a glass slip from the radiant heat. The observer is sheltered from the intense light at high temperatures by a wedge of tinted glass, which further can be used in photometrically estimating the temperature by using it to obtain extinction of the field.

**VOLAPUK** is the name given to a new and what is intended to be a "universal commercial language," which was originated about five years ago by Herr Schleyer, of Switzerland, and which seems to be meeting with greater favor than has been accorded other projects of this kind. It is reported that Volapuk is already spoken with facility by thousands of Europeans; knowledge of it is being disseminated by 53 societies scattered over England, Germany, Austria, Sweden, Holland, Asia Minor and many other countries. Volapuk grammars for the use of Hottentots and Chinese, besides all the European nations, are either in the market or in course of preparation; and two reviews, one entirely of Volapuk, and the other with a translation on the alternate pages, are regularly published. The special advantage of the new language is the ease with which it can be learned, eight lessons having enabled a Parisian class to correspond with students in foreign countries.

**SOIL, CROPS AND MOISTURE.**—The interesting researches in Germany, by Prof. E. Wollny, have shown that both soil and crops have a great influence upon the proportion of moisture in the atmosphere. Other things being equal, the atmosphere moisture is greatest over humid soils, least over sands, and takes an intermediate position over clays. The air over flat and concave surfaces is moister than that over adjacent slopes, while easterly and westerly inclines take an intermediate place. The moisture is greater over a plant-covered tract than over a bare soil, and increases with the density of the vegetation. Among ordinary crops, meadows impart most moisture to the air; then follow perennial fodder plants, such as clover and lucern; then summer crops which have a prolonged vegetation, such as turnips, maize, oats, beans and potatoes; then those of briefer growth, as flax, rye, barley and peas; and, lastly, winter wheat.

"BORE" OR "EAGRE" is the name given to those peculiar phenomena in which the tide moves all at once in the one direction or the other. The best and most noted examples of this phenomenon are said to be furnished by the mouths of the rivers Amazon, Hoogly and Tsientang. In the case of the last mentioned river, in China, the wave plunges on like an advancing cataract, four or five miles in breadth and 30 feet high, and thus passes up the stream to a distance of 80 miles, at the rate of 25 miles an hour. The change from ebb to flood tide is almost instantaneous. In the Amazon the whole tide passes up the stream in five or six waves following one another in rapid succession, and each 12 to 15 feet high. A very noted example of this phenomenon is also seen in the Bay of Fundy, on this continent.

**ELECTRICITY UNDER AIR PRESSURE.**—A German scientist, Mr. Walter Hempil, has recently made a discovery that may lead to important results. He has observed that the quantity of electricity furnished by a machine increases considerably when the latter works in an atmosphere of compressed air. A machine that, under ordinary atmospheric pressure, produces, for instance, 15 sparks a minute while making 400 revolutions, produces 32 when the pressure is increased to two atmospheres. By further increasing the pressure of the surrounding air the quantity of electricity generated increases in considerable proportions. This curious phenomenon will most likely add greatly to the economical value of electricity.

**THE LATE ECLIPSE OF THE SUN.**—Important photographs of the sun have been secured at Granada, where the eclipse has been seen to great advantage. The corona extended nearly two diameters from the sun and exhibited a feathery structure at the poles. The coronal spectrum was similar to that of the eclipse observed in 1883 in the Caroline islands.

**SCIENTIFIC EXPLORATION.**—W. G. Blunt, the naturalist, has been commissioned by the Smithsonian Institute to institute a thorough scientific exploration of the botany and archaeology of San Miguel island, off the southern coast of this State. The island is said to abound in Indian mounds and relics of a somewhat peculiar character. The exploration will be undertaken by the consent and through the courtesy of W. H. Mills, Esq., the owner of the property.

**WHEN TREES WORK AND SLEEP.**—Science tells us something very different from what we would naturally think—namely, that the fruit on trees slumbers in the daytime and works at night. The fruit of the cherry laurel, for instance, has been found by Dr. Krauss, of Halle, to increase at the rate of 90 per cent at night and only 10 per cent by day, while apples increase 80 per cent at night and 20 per cent in the daytime. While the juices enter and enlarge the fruit chiefly by night, the warmth and light of the sun by day elaborate the same and cause it to assume its proper relation and conditions in the particular fruit into which it has entered.

**PRACTICAL USE OF METALLIC HYDROGEN.**—Two Germans of unpronounceable and unspellable names have recently published in an unpronounceable technical journal a very interesting paper on the application of metallic hydrogen to analytical chemistry. Following Graham, they find that hydrogen, absorbed by palladium—which they consider as metallic hydrogen—possesses a remarkable reductive power, nearly all the metals being precipitated by it in a metallic state. The authors use a thin rolled plate or a wire of palladium saturated with hydrogen by the galvanic process.

**SPANISH GEOGRAPHY.**—The field for geographical explorations is not yet exhausted even in Europe. Schrader states that in the north of Spain several ranges of mountains exist, some reaching a height of 10,000 feet, which have no place on any geographical map. In the Aran valley another discovery has recently been made. Triangulation showed a gap unfilled between two chains of peaks which, approached from different sides, had been supposed to form a single range, and further exploration proved that the gap contained a large and hitherto unknown lake.

**A NEW FORM OF TIN.**—An American paper says a new form of tin, called by the inventor, Albert Assam, of Rahway, N. J., "assayne," is produced by a special treatment of tin. It has all the good qualities of the latter, can be pressed into any shape, or cast into statuary, or used for plate ware of any description. A beautiful bronze color can be given to the latter, or any shade from bronze to a silver color; and as it does not in the least corrode, it is especially valuable as a silver solder. It melts at a temperature of 430°, or 18° less than tin.

**A CURIOUS FLOWER** is said to have been recently discovered on the Isthmus of Tehuantepec, Mexico, which has a faculty of changing its color during the day. It grows on a tree. Another peculiarity of this floral chameleon is that it only gives out perfume at noon. One of the strangest things about this flower, however, is that it should be found in Mexico, when its colors are those of the United States flag. In the morning it is white, at noon it changes to red, and at night it adopts a soft blue color.

**MAGNETISM AND HEAT.**—Scientists are now discussing the curious fact that the usual heat produced by friction is conspicuous by its absence when the articles are magnetized. One example described was where a workman fastened a couple of powerful magnets to his lathe to hold more securely a piece of metal which he wished to drill and turn. The presence of the magnets kept the metal so cold that no water was needed to keep the drill moist, a very unusual circumstance, which may lead to important mechanical advantages.

**THE RECENT EARTHQUAKE AT CHARLESTON** has brought up numberless reminiscences in regard to former earthquakes on the North American continent. Among others the dwellers in the Merrimac valley in New England are reminded that, at the time of its first settlement by whites, frequently and seriously shaken were they by internal convulsions in the lower Merrimac, where the city of Lawrence now stands, ruptures of the earth occurred, and sulphurous deposits offensive to the noses of the pioneers were thrown out.

**PEAR PHOSPHATES** for extracts are made as follows: Take Bartlett or other good pears, cut or chop very fine, press, allow to settle, pour off supernatant liquid. To one pint of this pear juice add one pint acid phosphate and one pound of sugar, or enough to sweeten. The acid phosphate referred to is generally a solution of the phosphates of lime, magnesia, potash and iron, in such a form as to be readily assimilated by the system.—*Scientific American.*

**A REMARKABLE EXPLOSION** recently occurred in Germany, which shows the force possessed by finely disseminated dust, and the facility with which it may be exploded. A sack of flour, falling downstairs, opened and scattered the contents in a cloud through the lower room where a burning gas flame set fire to the dust, causing an explosion which lifted part of the roof off the mill and broke almost all the windows.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**TRACE-HOOK.**—Chas. Dudley, Stockton. No. 349,632. Dated Sept. 21, 1886. This invention relates to that class of trace-hooks in which a plate is secured properly to the trace, and has on its end a suitable engaging-hook. This hook has a guard projecting within the space inclosed by said hook, which prevents any accidental disengagement. A fold of the trace also guards the entrance to the hook to prevent any portion of the harness from becoming entangled.

**OSCILLATING GAS METER.**—Anson F. Fisher, Chico, Butte Co., assignor of two-thirds to Allen Henry and A. M. Barley. No. 349,489. Dated Sept. 21, 1886. This invention relates to that class of gas meters in which an oscillating cylinder or drum is operated by the inlet and exhaust of the gas passing through it; and the invention consists in the novel cylinder or drum in connection with the water seal on which it operates; in the peculiar valve-mechanism operated by the cylinder, whereby the gas is admitted and exhausted, and in certain improved details of construction.

**TRUSSES.**—Jesse G. Henderson, Grizzly Flat, El Dorado Co. No. 349,498. Dated Sept. 21, 1886. The object of this invention is to provide a simple and effective truss—one which can be worn without inconvenience, and which, on the contrary, will give the wearer all the comfort to be obtained from a perfectly-fitting, pliable apparatus, the pad of which is soft and yielding, and on account of its construction and the connections of its securing-bands, cannot get out of place, but will remain in position no matter what may be the position assumed by the wearer.

**ENGINE VALVE-GEAR.**—Robt. A. McLellan, S. F. No. 349,512. Dated Sept. 21, 1886. This engine valve-gear consists of a lever centrally fulcrumed to the frame, and having its lower end connected with an eccentric in a radial plane with the crank, and a second lever, the upper end of which is suspended from the upper end of the first and its center connected with a second eccentric, set in advance of the crank. These are combined with a rod adjustable upon the second lever and connected with the steam-admission valves. The resultant motion, due to the action of the two eccentrics, is communicated by a rod to the valves.

**ADDING MACHINE.**—Arthur E. Shattuck, Sacramento, and Charles Thorne, Jr., S. F., assignors of one-third to Geo. C. Gaylord, Nevada City. No. 349,459. Dated Sept. 21, 1886. The device is an apparatus for mechanically adding columns of figures. It consists of one or more open belts, slides, or chains, passing over rollers having digits imprinted upon them, and tables with corresponding digits, and mechanism connected with the rollers, whereby those representing the next higher denominations are properly rotated and prevented from turning too far; and, in connection with these, of an independent drum or roller having a series of figures only upon its periphery, whereby the higher amounts may be indicated without increasing the number of chain wheels and connected mechanism.

**MINES IN EASTERN OREGON.**—Professor Clayton says he has in the Blue mountains of Eastern Oregon an old vein precisely similar to the blue lead which runs through Plumas, Sierra and Tuolumne counties in California. Where the rim of this Oregon dam has been broken down in places, rich placer mines and many nuggets, running from an ounce up to \$1000, and in one case up to \$3237, have been found. The professor believes that if the bottom of the ancient channel can be reached, the greatest gold deposit of the West will be uncovered.

To all appearances the experiment of bringing white cigar-makers to this city for the purpose of supplanting the coolie labor engaged in that occupation has proven a failure. Many of the men have been sent back to their Eastern homes. The cause of the failure is said to be due very largely to the advertising given the blue label, which had the effect of flooding the local market with Eastern cigars, 26,000,000 having been imported in a single month. There were also other causes which operated against the white laborer.

**FRANK OLIVER and Mr. Johns**, our harness-maker, have been doing some prospecting on "Jump-off Joe" creek during the past ten days, and obtained \$28 of the very choicest coarse gold for about six days' actual labor performed. The manner of work was by sinking holes and cleaning the bottom of them up.—*Or. Courier.*

**THE DISPOSAL OF SNOW BY STEAM HEAT** is successfully practiced in London, and at a much less outlay of money than is required to cart it from the streets. Pits are provided with steam coils at the bottom; into these pits the snow is shoveled, and being rapidly melted, runs into the sewers.

## USEFUL INFORMATION.

**FRENCH MASONRY.**—The walls of buildings in French cities are generally built solid, and the method of working and fixing is different from that followed in England. The masons are divided into two classes: first, those that take the rough block as it comes from the quarry; two men generally working together sawing and roughing out, and making beds and joints. The principal tools used are the axe and a kind of drag, formed out of a piece of wood about eight by three inches, with six pieces of saw plate inserted. The prepared stones are taken by laborers to the lift, which is in most cases a square, fixed scaffold with patent crab at the bottom, which can be worked by hand or steam power. These scaffolds are fixed at the commencement of building to the intended height, and are built of timber from eight to ten inches square, braced with bolts and dogs. The stones are drawn up the height required, and are then rolled from the scaffold to the wall, and placed in by means of bars, no other appliances being used. This is certainly no improvement on the English system of fixing. The beds and joints are rough and large, varying from one-half to three-quarters of an inch. In fixing and working, the men do not regard the position of beds and joints. These often come close to the nose of architraves in the center of pilasters and close to breaks. After the wall is built, they start from the top of the structure and work down. The masons who do this part seem to be very good workmen, finishing their work quite as well as English masons. Their tools are similar, excepting that they use planes which are formed to suit any kind of molding. These tools would not answer for English soft stones, which are more subject to veins and bars.

**USE OF MOLASSES FOR MAKING BRIQUETTES OF COAL AND ORE.**—A German chemist and metallurgist, Dr. Kosmann, strongly recommends the use of molasses for forming small coal and fine ore into solid briquettes, as first proposed by Saltery. A mixture of from one to one and a half per cent of molasses was sufficient to make coal-dust of very lean Silesian coal, into good solid blocks that gave a strong coke. Such blocks are also excellent for gas-making. In similar manner blocks can be made of any powdery iron ore, such as some magnetic ores and pyrites' residues. For the direct production of iron from ore so treated, it is proposed to have chambers built in connection with coke ovens in such a manner that the gases from the ovens can be made to pass through the charge of iron ore. Worked, for instance, in connection with a range of Coppee ovens, as each Coppee chamber will hold three tons of coal, the chambers for the iron ore would require to be about one-fifth the size in order to hold the same amount of ore of from 65 to 70 per cent. Such a charge would give about two tons of iron sponge, and a charge could be put in, reduced, and drawn out every four hours, so that in 24 hours 12 tons of sponge would be produced. The sponge would be squeezed and hammered, and the bloom, after reheating, drawn out to bars, which would be cut up and used as excellent material in the Siemens-Martin or in the crucible steel process.

**GRINDING VS. FILING SAWS.**—The majority of sawyers now grind their saws. It is quicker than filing, is cheaper, and leaves the saw in good shape. Some writers say "grind square across," and we have tried it, but we think it is better to have the front of the teeth a little "fleaming," even for hard wood, and more so for soft. According to our principles, as laid down in our article on cutters, this should be so. Saws that are filed by the average shop hand often look as though they could "gum it" better than they could cut with their teeth. Don't run a saw with the teeth half filed down; gum your saws and keep them gummed. Some room must be left for the sawdust to fall into as the teeth cut it out. Give the saw a liberal set. If you are afraid of using up too much lumber, get a thin saw. Thin saws are the ones to do the work, but they must be kept out of the hands of cheap men. Many shop-owners have the idea that it is a saving to have one man furnish the brains to run the shop, and hire 75 cent men to run the machines. This works well enough in theory; but in practice cheap hands will run in every knotty or poor piece of stock available, and the cost of keeping their machines in order is more than equal to the amount saved from their pay. Put the best men in the shop that you can get. Establish a set of premiums for better work, and better methods of doing it, and your shop will pay.

**AN ELECTRIC SWORD** has been invented which, when the point touches the party attacked, sends a powerful shock through him, and if not immediately killing will at least put him *hors de combat*. The sword is an ordinary military saber, but along its whole length is let in a fine platinum wire which ends at the foil of the weapon. A small but very powerful storage battery is strapped about the waist, much the same as a cartridge-box. Insulated wires connect this battery with the sword, and by pressing a button the holder can complete the circuit at pleasure.

**FACTS CONCERNING TIMBER.**—Some timber is more durable in wet ground or immersed in water, such as elm, beech, alder; while others,

such as ash, oak and fir, are more durable in dry situations. The increase in strength due to seasoning of different woods is given as follows: White pine, 9 per cent; elm, 12.3 per cent; oak, 26.6 per cent; ash, 44.7 per cent; beech, 61.9. The comparative value of different woods showing their crushing strength and stiffness, is: Teak, 6555; English oak, 4074; ash, 3572; elm, 3469; beech, 3079; mahogany, 2571; spruce, 2522; yellow pine, 2193; sycamore, 1833; cedar, 700. Regarding the relative degrees of hardness, shell-bark hickory stands the highest, calling that 100; white oak is 84; white ash, 77; dogwood, 75; scrub oak, 73; white hazel, 72; apple, 70; red oak, 69; beech, 65; black walnut, 65; yellow oak, 60; white elm, 58; hard maple, 56; wild cedar, 55; yellow pine, 54; chestnut, 52; white pine, 30.

**REMOVING OIL, ETC., BY INFUSORIAL EARTH.**—Scouring or removing oil or grease from substances such as wool and woolen cloth, by means of either infusorial or fullers'-earth, is claimed as an improvement by Groth. This kind of earth is one that absorbs a great quantity of liquid, and is what is used to absorb nitro-glycerine and make it into dynamite. The patentee states that it is this extraordinary power of taking up liquids which enables it to withdraw oil from textiles containing it. The process is to warm the textile with the infusorial earth in some apparatus where the temperature may exceed by 10 or 20 degrees the melting point of the oil or grease. As soon as it is liquefied, the infusorial earth takes it up from the textile. After this the materials are passed through warm water which washes off the earth, leaving the cloth clean.

**A POINTER FOR MOLDERS.**—A correspondent of the *American Machinist* writes: "I was making at one time some castings with a very steep joint. I used to get lake sand, wet it and sleek it up. One day a tramp came along and stood looking at me. Said he, 'Why don't you get some rags for that job and use them in the place of that sand?' I got some rags, wet them and put them on, and they beat all the parting sand and paper I ever tried."

**A FIRE SCREEN** has been devised, the object of which is to prevent the spreading of fires in cities. It is a broad netting of iron wire which is carried on trucks and run up on proper appliances in such a way as to cut off the flames from a burning building. It operates on the same principle as the Davy safety lamp.

## GOOD HEALTH.

**COLOR-CHARGED WATERS.**—A new remedial agent seems to be seeking recognition, as witness the following from E. D. Babbitt, M. D., in a late number of *Herald of Health*: "Now, as the seasons of summer complaints are upon us, I wish to impress upon all readers the great importance of the blue-charged water to check diarrhea, dysentery, summer complaints, spasms, nervousness, etc. Put ordinary water in a blue bottle, and let it stand in the sun from an hour upward, the longer the better, and then for a child afflicted with summer complaint give a teaspoonful every 30 to 60 minutes until relief comes. For diarrhea, etc., give an adult a tablespoonful at a time. Hundreds of cases have been cured thus. A case of chronic diarrhea in Brooklyn, which had baffled eminent physicians for years, was easily cured by this blue-charged water.

"I want to call attention once more to the yellow-orange or amber colored bottle in which to sun-charge water for curing constipation, rousing the liver into greater action, etc. One of the millionaire business men of New York, whose name is like a household word throughout this and several other countries, had such inactive liver and bowels that he had to take medicines daily to bring about action. I furnished him with a yellow bottle, and although he was somewhat faithless as to its good effects, he found he could throw aside the drugs he had been taking. He said it was worth a thousand dollars to him, and that he had not been so well for three years. This yellow principle is especially nerve-animating, and is very useful for those who tend toward paralysis."

**DOGS ARE SUBJECT TO "RUNNING FITS."**—The talk about Pasteur and hydrophobia, a dog-fancier informs us, has had a marked effect on his trade. The sending of people across the water to be treated for hydrophobia has riveted attention to the danger of keeping dogs, and many fashionable ladies have disposed of their pugs and other four-footed beasts, and babies are growing in popularity as pets. "Hydrophobia is a fraud and Pasteur is a humbug," said Fourfoot, the fancier. "Dogs have running fits which will pass off if they are let alone. If caught by the windpipe and salt put in his mouth, a dog will be cured of these fits. They may bite sometimes, but hydrophobia results from nervous fright." But such talk, even though widely advertised, will not help the trade. Dogs with "running fits" will continue to be treated as mad, and they are not likely to get the benefit of any doubt on the subject, either.—*New York News.*

**MEDICINAL QUALITIES OF VEGETABLES.**—Spinach has a direct effect upon the kidneys. The common dandelion, used as greens, is excellent for the same trouble. Asparagus purges

the blood. Celery acts admirably upon the nervous system and is a cure for rheumatism and neuralgia. Tomatoes act upon the liver. Beets and turnips are excellent appetizers. Lettuce and cucumbers are cooling in their effects upon the system. Beans are a very nutritious and strengthening vegetable. Onions, garlic, leeks, olives and shallots, all of which are similar, possess medicinal virtues of a marked character, stimulating the circulatory system and the consequent increase of the saliva and the gastric juice, promoting digestion. Red onions are an excellent diuretic, and the white ones are recommended eaten raw as a remedy for insomnia. They are a tonic and nutritious. A soup made from onions is regarded by the French as an excellent restorative in debility of the digestive organs. With vegetables, as with everything else, much depends upon the cooking and the care and preparation beforehand. Washing in several waters is necessary to prepare nearly all kinds of green vegetables for the table, and great care must be given in examining spinach, lettuce, greens and cauliflower, as often very minute insects are lurking in or under the leaves of these.—*Phila. Grocer.*

**CHOLERA-INFANTUM.**—Absolute cleanliness is the first thing to be observed. Bathe your child every morning two hours after its breakfast. Keep a flannel bandage about its abdomen throughout the summer. Change all its clothing on putting it to bed at night. Keep it in the open air about eight hours a day. Feed it at regular intervals of about four hours. Offer it pure cold water several times a day. If you feed it artificially, you must pay the strictest attention to the cleanliness of the nursing bottle. You cannot trust this to any one else; you must attend to it yourself. The bottle when not in use should be kept standing in cold water. It should be daily placed in boiling water. When a child is actually suffering from this disease, give rice water. This has been found highly satisfactory, and been the means of saving many a child during such an attack.—*People's Health Journal.*

**LEAD POISONING FROM EATING AN APPLE.**—The *Journal de Medecin de Bruxelles* reports that a lady who had previously enjoyed perfect health was suddenly taken with violent colic, which, though very severe, passed away, and the next day she consulted a Parisian physician, who diagnosed lead colic. No possible source of the lead could be suspected, however, until the lady called to mind that the day before the attack she had eaten an apple in which she had found, on eating, a shot pellet. It was then concluded that this pellet, in combination with malic acid of the apple, was the cause of the attack. The story shows, at any rate, what expert shots Parisian, as well as other physicians, sometimes are at a diagnosis.

**CLEANSING LADIES' HAIR.**—We object to the use of carbonate of potash by hairdressers for cleansing the hair of their customers. The cleansing action of this powerfully alkaline substance is very effective, but it is prejudicial to the hair at the same time. A teaspoonful of pulverized borax in a cup of boiling water, or cleansing the hair with the yolk of a fresh egg, and following this with a warm solution of borax or salt and water, especially sea water, is much preferable, and has the effect of cleansing and softening the skin of the scalp. Eastern ladies, remarkable for the beauty of their hair, adopt the latter mode of cleansing it.—*Herald of Health.*

**SMOKING AND DRINKING.**—Tobacco blindness is becoming a common affliction. At present there are several persons under treatment for it at one London hospital. It first takes the form of color blindness, the sufferers who have smoked themselves into this condition being quite unable to tell the color of a piece of red cloth held up before them. Sometimes the victim loses his eyesight altogether. Although smoking is to a large extent the cause of the malady, and so gives it its name, heavy drinking is also partly responsible.

**THE KING OF SERBIA** seems to have a parental care over his subjects, as witness the following edict, which, it is said, he has recently issued: "Whereas, it is irrefutably proved by science that the so-called antiseptic treatment of wounds yields more beneficial results than all other methods, we are pleased to order that henceforward the said antiseptic plan of treatment be solely employed in all the hospitals of our kingdom, and that corrosive sublimate and iodoform be used until our further disposition."

**GRIEF ANTICIPATES AGE.**—Dwelling on the inevitable past, forming vain hypotheses as to what might have been if this or that had or had not been, acquiring a craze for a recounting of what has occurred—these acts do more harm to future health and effort than many things connected with real calamity. Occupation and new pursuits are the best preventives for mental shock and bereavement.

**NUTMEGS POISONOUS.**—The common nutmegs are poisonous in large doses. In a case which came under medical treatment, a lady had eaten a whole nutmeg and a half, which caused extreme drowsiness, then great nervous excitement, followed by subsequent depression and pain in the region of the heart. This case points to the presence of an active principle which should be investigated.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Alameda.

**MAGNESIA.**—Livermore Herald, Oct. 2: John Hayes has started a train of four mules between the magnesite mine and the end of the chrome road on the top of Cedar mountain. The distance is nearly two miles, and the difference in altitude 1200 ft. Each mule packs out two sacks of magnesite at a trip, aggregating 225 pounds. There are now five men at work in the mine, and the rate of production has been largely increased. The average is now nearly a ton a day of cleaned and assorted magnesite. There is but little change in the appearance of the vein now being worked, though that little is for the better. The first carload will be shipped as soon as it can be hauled in, which will be by the middle of next week. A second carload will be ready soon after. The product goes direct from Livermore to New York by rail.

## Amador.

**SUTTER CREEK.**—Amador Ledger, Oct. 2: The rock at the Lincoln is getting scarce, and in all probability operations will soon come to a standstill for awhile. As soon as one of the adjoining mines starts up, however, there will be a chance to resume work, as taking the water from the Mahoney will drain the Lincoln, and the presence of so much water without adequate facilities to control it is the trouble with the latter. Three gentlemen interested in the Mahoney mine came up from San Francisco this week. It is evident they intend to do something with the property soon. It may not be anything more than surface work, but even that will be hailed as a decided improvement upon the inaction which has prevailed so long. It is expected that the job of cleaning up the Eureka mill will take until near Christmas to complete. The water in the Amador canal is running low, and considerable machinery has come to a standstill in consequence thereof. The South Spring Hill mill is idle for want of water.

**MISCELLANEOUS.**—A force of six carpenters was set to work Monday last to erect hoisting works on the McKay mine, in Hunt's gulch. The works are to be run by water-power. Eight hundred feet of pipe is being made by Hewitt Bros., and the fall will be about 150 feet. The mine is said to be looking well as far as prospected. The depth of the shaft is 50 feet. It is the intention to sink a couple of hundred feet before thinking of erecting a mill. There has been some talk that the Moore mine has been sold, but we are unable to say whether there is any truth in it. The mine is said to be developing in grand style, and giving better promise than ever of becoming a permanent and paying property.

## Calaveras.

**BONDED.**—Calaveras Citizen, Oct. 2: The Rathgeb mine, situated about three miles from San Andreas, has recently been bonded to an English company, and active preparations are being made for the erection of a large mill on the same. The machinery is on the road, and a large force of laborers was set to work grading a place for the mill, which will be erected on Calaveras creek, a short distance below Binn's. George Wiggins, of the Banner mill, has the contract to furnish the lumber, and now has several teams busily engaged hauling it.

**ANGELS MINING NOTES.**—The Gold Cliff mine, situated about half a mile from Angels, is closed down at present, pending the repairs on the Union Water Company's ditch. As soon as the ditch is completed and the water turned in, the Gold Cliff will resume operations. A 60-stamp mill will be erected as soon as all the material can be got upon the site. Lumber is being hauled at present, and soon the ringing of saws and hammers will be heard echoing through the hills. The Stickle mine is also at a standstill, awaiting the arrival of water. Mr. Carter has been appointed superintendent, vice Mr. Rose, resigned. The Tozer mine, which has been closed down for the past three months, will also resume operations as soon as water can be had. Steam is generated tri-weekly for the purpose of freeing the mine from water. It is reported that a new 20-stamp mill will be erected to take the place of the "cannon-ball" mill, which formerly did the work of pulverizing. The Utica mine, superintended by Chas. Lane, is running in full blast night and day. The mill sends forth an incessant roar, and is pulverizing some very rich ore at present. A large cleanup is expected. The Utica is the only mine in operation in this place at present. The large reservoir recently constructed by the Utica Mining Company on Bald Hill has proved a profitable investment this season during the repairing of the Union Water Company's ditch. The reservoir was filled while water was plentiful, and has aided materially in keeping the mine in operation during the repairing of the ditch. The Matson mine is shut down for the same cause that the other mines are. It will start up with the balance. As soon as the mines start up the mantle of dullness, which has grown monotonous, will be lifted, and the busy hum of activity will again enliven every avenue of this village.

## El Dorado.

**SHINGLE SPRINGS.**—Independent, Oct. 3: A load of machinery came up on Wednesday for the Oro Fino mine. The Vandalia mine, we are informed, has been bought by Kelly, Ives & Co., who will proceed immediately to put on a five-stamp mill and steam power. The Old Church mine, north of the Springfield, has been bought by a company which is now to be called the Ruth Mining Company, who are now putting up machinery for developing the same.

**MENDON.**—Placerville Observer, Oct. 2: There are quite a number of people living up here in the woods, and all seem to be doing something. Quite a number are working in the timber regions, some are farming, while a goodly number are prospecting for quartz. The Crystal mine, L. L. Alexander, superintendent, under the supervision of John Richards, a miner of great experience, is kept running night and day. They are running a tunnel in to cut the ledge. The tunnel is now in something over 700 feet, and they have several hundred feet yet to run before tapping the vein, when they expect a bonanza. The Parker Brothers have done considerable

work on their mine, and are at present erecting a mill. There are several hydraulic mines in this part of the county, which bid fair to develop into good properties. Among these is the Slug Gulch mine, owned by Mr. Hale, the Hale and Buchanan mine at Indian Diggings, the Ball mine, and also the Claghorn mine, owned and worked by our worthy deputy assessor of that name. We have also several promising mines east of this place, one of which has been sold recently by Mr. Jas. Oxley, who has since accepted the position of foreman of the Slug Gulch mine.

## Inyo.

**MILL STARTED.**—Inyo Independent, Oct. 2: For several weeks past preparation was making to start up the Hawley mill, at Keeler. Nothing had been done at the mill in a long time, but now a good deal of ore is on hand and the mill is likely to be kept busy for some time. It was expected that everything would be ready for starting yesterday or to-day, and in all probability the mill is now running.

## Mono.

**THE BODIE.**—Miner, Oct. 4: North drift on 620-foot level is extended 23 ft in good ore. South upraise from 700-foot level is extended 12 ft. Middle upraise from 700-foot level is extended 11 ft. South drift on 800-foot level is extended 30 ft. West crosscut from south drift on 800-foot level is extended 7 ft. North drift on 800-foot level is extended 14 ft in \$25 ore. Winze from 700-foot level is extended three feet in fair ore. There were employed 15 miners and 2 carmen at \$4 per day, and jointly with Mono 2 firemen, 1 blacksmith's helper, 1 carman, and 1 watchman at \$4 per day; 1 blacksmith and 6 engineers at \$5 per day; 13 carpenters, 9 laborers, 1 bricklayer and 1 foreman.

**THE MONO.**—We are taking out ore below the 700-foot level. There were employed 2 miners at \$4 per day, and jointly with the Bodie Con., 2 firemen, 1 blacksmith's helper, 1 carman and 1 watchman at \$4 per day; 1 blacksmith and 6 engineers at \$5 per day; 13 carpenters, 9 laborers, 1 bricklayer and 1 foreman.

**THE DUDLEY.**—The south drift, 700, is extended 10 ft with no change. There were employed 2 miners at \$4 per day.

**THE BULWER CON.**—The south drift No. 1, 100, is extended 16 feet in \$30 ore. The south drift No. 2, 100, is extended 10 feet in \$33 ore. The north drift, 100, is extended four feet in low-grade ore. Upraise No. 2, 200, is extended 12 feet; two feet good ore in face. All chutes, dead-work, etc., on this level are completed. The west crosscut, 300, is extended five feet. Upraise No. 1, 360, is extended 10 feet in rich ore. Upraise No. 2, 360, is extended five feet in low-grade ore. Upraise, 400, is extended 14 feet in good ore, with ledge increasing in size and quality. Have eight feet further to run to connect with the 360 level. There were employed 21 miners, 3 carmen and 1 blacksmith at \$4 per day; 1 shift-boss at \$5 per day, and 1 foreman at \$6 per day.

## Napa.

**QUICKSILVER SHIPMENTS.**—Calistogan, Oct. 2: The increase of price of quicksilver has evidently had a tendency to increase the production, as the shipments from Calistoga appear to be greater, and particularly is this true for September, for which month the following is a record: Sulphur Bank mine, 156 flasks; Great Western mine, 116 flasks; Napa Con. mine, 54 flasks; Bradford mine, 21 flasks; total, 347 flasks. The Sulphur Bank mine, since a couple of assessments on its stock have been paid, is doing finely, and present stockholders are evidently making money out of it. The Bradford brothers are doing the best business in quicksilver mining of all the rest. They are, of course, not producing as much as is taken from the larger mines, but they have comparatively little expense, the metal being very easily obtained. Furthermore, all the money they receive is theirs, there being no outsiders interested in the property. Their receipts the past month from shipments amount to about \$800.

**KNOXVILLE QUICKSILVER.**—Napa Reporter, Oct. 2: The balmy days of Knoxville are passed, if not for all time, at least for many years. Once the scene of great activity, when hundreds of men found constant employment in the Redington quicksilver mine, it now has the appearance of a deserted village. In the old days referred to, quicksilver sold for \$1.50 per pound, and as long as these prices ruled the mine was worked for all it was worth, and proprietors, miners and teamsters were happy. When the price of quicksilver dropped to a low figure eight or ten years ago, the mines shut down in whole or in part, and though the price of the metal is now higher than it was a short time ago, work at the mine has never since been vigorously prosecuted. About 18 months ago the mine changed hands, Messrs. A. McMillan, who has been connected with it in one capacity or another for many years, and J. D. Langenour, of Woodland, becoming owners. Twenty-five men are now employed in two shifts, day and night, and the monthly output is about one hundred flasks. It is sent to market via Napa City. Since the new furnaces (Livermore patterns) were erected, much of the ore that was thrown away under the old style of roasting is now profitably worked. The old furnaces are, and have been for several years, idle, and will in all probability never again be used. Several men are at work in the tunnels, and recently a vein of very fine ore was struck which promises excellent returns.

## Nevada.

**WORK BEGUN.**—Nevada Transcript, Oct. 1: Fifty men were put at work yesterday, grading for the pipe line that is to convey the waste water from the Empire mine to the works of the North Star. A fall of 250 feet, giving about one-horse power for each inch of water, is to be had. The pipe will be extended in time to the Allison Ranch mine, giving at the latter 200 feet of fall.

**BOSS.**—North San Juan Times, Oct. 2: The Boss mine, or, as the head one of the owners termed it, the "mother ledge," is at work. How well it is doing nobody but the owners know, and they will not tell. They say, when interviewed, "We are satisfied with the results, and are not discouraged." From the best evidence we can obtain, and much of that is rumor, we are inclined to believe that the rock will pay on an average six or eight dollars per ton, and that with a 20-stamp mill in operation the mine would pay very extensively.

**RICH QUARTZ.**—Tidings, Oct. 5: We are informed that some rich quartz is being struck in the

vicinity of Rough and Ready. The strikes are mostly of the pocket order, being decomposed ore, and, when found, prove to be very rich. We understand that two parties of Rough and Ready struck a \$700 "pocket" last week.

## Placer.

**NEW MILL.**—Placer Republican, Sept. 29: The new mill at the Belvoir mine near Ophir will start up this week. It is about a year since this mill was begun, but it has been well built, and if the novel machinery which has been put in is found to be good, it will be one of the best mills in the county. Instead of stamps, a J. B. Low quartz mill has been put in and is the first one of the kind in this part of the country. This mill consists of a cylinder, four feet in diameter and about three feet thick, which revolves on a horizontal shaft. Within the cylinder is an iron ball, weighing about 1600 pounds, which, as the machine revolves, rolls in a groove on the inside of the cylinder. The rock runs through a self-feeding tube into the cylinder, and is crushed by the ball. The sides are covered with wire netting through which water carries the crushed rock. The Belvoir mill is fitted up with two of these machines which are expected to work from 15 to 20 tons a day. It also contains a concentrator made after original plans by Samuel Howe, who has charge of the mine.

**FOUR-FOOT VEIN.**—Mr. Huntington, inventor of the Huntington quartz mill, arrived from San Francisco last week and paid a visit to a quartz claim near Damascus, which he is prospecting. It is reported that the tunnel has just cut a four-foot vein of good quartz. Ten men are employed at the mine now, and if the report of the strike is true, a quartz mill will be at once erected and the working force largely increased.

**PIKE CITY AND THE ALASKA MINE.**—North San Juan Times, Oct. 1: We made a flying trip to Pike City on Sunday last. We had the pleasure of exploring the vast depths of the Alaska mine. We, for the first time, were lowered to the bottom of that mine, 500 feet below the surface, to the place where the great pump performs duty. It is a wonderful place and a wonderful pump. It keeps the mine at that place as dry as powder, throwing volumes of water at every stroke. Of course we did not explore the hidden mysteries of the mine, because our eyesight is too defective to follow the winding paths. The Alaska mine is running full-handed and at present is crushing some excellent rock. How well it is doing is past finding out, as the Alaska is a close corporation and not given to boasting. The Alaska Company is making extensive preparations for winter work, and have about 8000 cords of wood now placed in the yard and 2000 more in the woods ready for delivery. There are 125 men on the pay-roll, and wages range from \$2.50 to \$3.50 per day. The rock now being raised is not so rich as some heretofore crushed, but it pays handsomely. The Alaska is a good mine and under the present management is worked economically and successfully.

## Trinity.

**FROM DEADWOOD.**—Cor. Shasta Courier, Oct. 2: J. Falan, of the Vermont mine, has been hauling his quartz to Geo. Klein's cannon-ball mill, and last week from nine tons of rock cleaned up \$575, being within a small fraction of \$64 to the ton. His ledge is from four to six feet, and he is so well satisfied with his prospects that he has given up all ideas of either bonding or selling. His lessees, Wren & Leas, are also jubilant over what they have in sight, and are working vigorously. The Chlorination Works at the south fork of Deadwood gulch are progressing rapidly; ten men are employed. The clay for the bricks has to be hauled two miles, but they are determined to have everything solid and substantial. Everything about the Brown Bear and McDonald mines indicates prosperity.

## Tuolumne.

**TO COMMENCE CRUSHING.**—Independent, Oct. 2: Prof. Shraff expects to commence crushing at his mine on next Monday. The enterprise and speed displayed in building the mill and village at this mine is remarkable, and shows what Californians can do when they push things. We hope the ore will turn out the gold far beyond the fondest expectations, and wake up others to set other mines in active operation. These enterprises give occupation to a large number of workmen, and boom business of all kinds. Every man who starts up and makes a success of any one of the many good mines now idle is a public benefactor, and is, or should be, recognized as such.

## NEVADA.

## Washoe District.

**UTAH.**—Enterprise, Oct. 3: Have completed cutting a station on the south side of the shaft 472 feet below the surface, which corresponds with the 520 level in the Sierra Nevada mine, and have started a west drift.

**SIERRA NEVADA.**—On the 520-foot level west crosscut No. 4, started at a point 160 feet south from west crosscut No. 3 from the north lateral drift, was advanced 28 feet; total length, 28 feet. The face is in vein porphyry.

**UNION CONSOLIDATED.**—On the 700-level the work of advancing west crosscut No. 1 and the joint Mexican and Union Consolidated west crosscut at the south line is resumed.

**MEXICAN.**—Operations confined to extending the joint crosscuts mentioned above.

**OPHIR.**—On the 1465 level the timbering of the south drift from the Ophir shaft is being repaired.

**CONSOLIDATED CALIFORNIA AND VIRGINIA.**—On the 1400 level west crosscut No. 1 from the south drift from the C. and C. shaft was advanced 42 feet; total length, 293 feet. On the 1500 level from the station in the old Consolidated Virginia shaft, the south drift has been connected with the Consolidated Virginia stopes. On the 1600 level, the southwest drift, corresponding with the south drift on the 1465 level in Ophir ground, has been connected with the old California stopes. On the 1650 level, the timbering of the southwest drift running from the main west drift from the C. and C. shaft is being repaired. On the 1435 level, the south drift was extended 40 feet; total length, 75 feet. This drift corresponds with the 1300 level in Ophir. During the past week 1032 tons and 1595 pounds of ore were shipped to the Morgan mill. The average value of

the ore milled during the week, according to assays from battery samples, was \$18.38. Bullion of the assay value of \$25,941.53 was shipped to San Francisco since last statement.

**BEST AND BELCHER.**—On the 600 level a south drift started from west crosscut No. 1 in the 12-foot quartz body was advanced 18 feet; total length 87 feet. Operations at this point are suspended, as the face of the drift is near the Gould and Curry north line. East crosscut No. 1 was extended 57 feet; total length, 383 feet. The face is in vein porphyry, showing clay and a little water.

**GOULD AND CURRY.**—All work through the upraise connecting the 500 level with the 425 level is suspended. The station on the 425 level in the Bonner shaft is cleaned out and retimbered. The main west drift from this station has been reopened and timbering repaired a distance of 120 feet.

## Columbus District.

**YANKEE DOODLE.**—Candelaria fissure, Oct. 2: This promising claim is situated about one mile from the Mount Diablo. The tunnel is in about 30 feet. There is a four-foot ledge which will average about \$30.

**GLADSTONE.**—The owners have about 12 tons already sacked for shipment to San Francisco. The mine is looking fine, with a three-foot ledge of first-class ore.

## Cortez District.

**THE CAMP AND MINES.**—Cor. Silver State, Oct. 1: Any one wishing to arrive at Cortez all safe must leave the cars of the C. P. R. R. at Beowawe. The stage leaves Beowawe for Cortez three times a week. We have a population in our vicinity of perhaps 250. The mill in which the leaching process is used, of 50 tons per day capacity, is not surpassed by any in the State. Mr. Wenban pipes his water a distance of eight miles to his mill; thence it is pumped to the mine, a distance of three-quarters of a mile, and a height of 800 feet perpendicular, where it supplies his men with water, also his boiler for running his air compressor, which is used for driving the Barleigh drills, and supplying air for such places in the mine as require it, although the mine is generally well ventilated without the use of compressed air. It is only a short time since that the water for running the machinery, domestic purposes, etc., had to be packed on mules or hauled in wagons to the mine. The Garrison, which is the name of the mine—and it is truly well named, for 20 well-armed men could stand an army off—is situated well up on the mountain side, about 7000 feet above sea level. The formation is limestone, with a giant ledge of quartzite extending for miles along the mountain, losing itself in the valley, and making its appearance again on the opposite side, some 15 miles distant. The Garrison produces some very beautiful and rich ore, principally chloride. All that Nevada wants to bring it to the front is for silver to be put on a solid basis and at \$1.29 per ounce, where it ought to be. Mr. Wenban's mill is running steadily on ore from his mine, and doing good work. Everything around both mill and mine is run in first-class order, and the owner certainly deserves a great deal of credit for his perseverance and energy.

## Eureka District.

**ORE SHIPMENTS.**—Eureka Sentinel, Oct. 2: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Geddes and Bertrand, 25½ tons; Willow creek, 1½; Silver Lick, 17; Silver West, 2½; Macon City, 13; White Pine, 6; Marguerita, 2½; Bullwhacker, 10; Western Contact, 14. To the Eureka Con. works—Jackson mine, 3 tons; Beck, 2; Willow creek, 1½; Featherstone, 14; Basey, 1; Dunderberg, 33; Altoona, 36.

## Ophir District.

**THE MILL.**—Belmont Courier, Oct. 2: The mill at Ophir, owned by John Foster, H. H. Warne, Pat Leonard and James Cruickshanks, is running steadily and producing fine bullion. The ore reduced is from their gold mine in Ophir. They feel sanguine that their venture will prove profitable. The Chicago Mining and Reduction Co. continues to make regular shipments of silver bullion from Ophir. The mine is looking well, and easily produces enough good ore to keep the mill running steadily.

## Philadelphia District.

**SILVER.**—Belmont Courier, Oct. 2: Silver—96¾—is on the upgrade. We hope to see it 106¾ inside of a week. The quicker it reaches its par value the better it will be for mining generally in Nevada. The mines of Belmont would then be started up and worked for all that is in them, and deep mining would take the place of surface scratching. There are big bodies of ore below any of the present workings of the mines in Philadelphia District which will be cut into and uncovered as soon as the price of silver will justify the necessary outlay of capital to place them in a condition to become self-sustaining bullion producers.

## Robinson District.

**A PRODUCER OF GOOD ORE.**—Eureka Sentinel, Oct. 2: The Keystone mine in Robinson District, White Pine county, has produced very good ore of late. Mr. Featherstone recently shipped to the Eureka Con. furnace 24 tons, four of which worked 270 ounces of silver to the ton, and the balance about 80. He has on hand 15 tons which he says will furnace at least 300 ounces to the ton. He expects to make a shipment of from 12 to 20 tons every two weeks from now on until the winter sets in in earnest. By those who saw it recently, the mine is said to look very promising.

## Tuscarora District.

**BELLE ISLE.**—Times-Review, Oct. 2: Belle Isle and Navajo line crosscut has been advanced 22 feet.

**NAVAJO.**—During the past week No. 1 winze on the east vein, 350-foot level, has been sunk 8 feet. The vein shows some improvement in width and high-grade ore. Crosscut, 150-foot level, has been extended 8 feet. South drift, west vein, same level, advanced 9 feet. Have resumed work in south drift No. 2, west vein.

**NORTH BELLE ISLE.**—Have commenced work in No. 1 crosscut, 300-foot level. The formation is the same as that in the hanging wall of the vein on the 150-foot level. The rock is breaking well, and good progress will be made in extending the crosscut to the vein. Good progress has been made

in No. 1 winze, 150-foot level. The quantity and quality of ore show no material change since last report. It continues to carry down high-grade ore from the foot wall to and beyond the west side of the winze. The drifts along the vein from No. 1 and No. 2 crosscuts, on this level, are looking well. All other work in and about the mine is being forwarded as speedily as possible.

## ARIZONA.

**HASSAYAMPA DISTRICT.**—Prescott *Courier*, Oct. 1: The following items we glean from G. H. La Berteu, just in from Hassayampa mining district: The steam arastras, together with the Governor mine, on the east fork of Maple gulch, have been leased by Mr. H. Layton, an old-time Prescottite and thorough miner and millman, who is, at the present time, busily engaged in retimbering the working shaft of the mine and putting things in shape to commence taking out ore for reduction in his arastras, four in number, with capacity to grind six tons per day. The steam-works of these arastras are of the finest quality and capable of running ten stamps. The mine is well developed by shafts, levels and a 150-foot tunnel, the latter tapping the vein at a depth of 300 feet. This is a valuable property and should have a 20-stamp mill to supply its requirements. The U. P. mine, which includes two claims in length, has developed into a triple mine. Formerly this property was valued only for its moderately-sized but rich vein of gold ore. Although it was known that a large vein traversed the claims, it was passed over as worthless, as in those days nothing short of about 40-dollar rock was considered any account. Lately there have been developed two separate veins measuring inside of their walls about four feet. One of these veins is developed by a tunnel 40 feet, which will tap the mine at a depth of 170 feet, and shows good-looking gold quartz. The other vein has a shaft sunk on it 50 feet with 15 feet of a drift, and assays well in gold, silver and copper. These three veins run parallel, and from every indication extend through the entire length of two claims. Mr. Dunlap, a very intelligent gentleman and good miner, has been for the past two years engaged in developing two mines at the head of Maple gulch, both of which are large and will undoubtedly develop into a very valuable property.

**PLACER MINERS.**—Tombstone *Epitaph*, Oct. 1: For years past placer miners have worked at different times in the Canyada del Rio, situated about 25 miles north of Tucson, and all the time, says the *Florence Enterprise*, they have known that an iron lead, 25 feet in width, cut across the head of the canyon, but none of them considered it worth while to prospect this lead. They found the placer gold distributed all the way up the canyon to the ledge, and none above it, but did not stop to think this would indicate that the gold came from the lead. Last week, however, Dr. Vanholster concluded to prospect this iron lead, and discovered that the rock was thoroughly impregnated with the precious metal. How rich the rock is has not yet been determined, but the unusual width of the lead will give it great value, even if the ore should prove to be very low grade. The news of this discovery will cause prospectors, who have passed over the lead without prospecting it, to hire an able-bodied mule to kick themselves with. It is now a known fact that nearly all of the iron leads in this country carry gold to some extent, and the wise prospector will not, in the future, pass over one in the belief that it is barren until he shall thoroughly prospect it.

**SILVER BULLION.**—Prescott *Courier*, Oct. 2: W. C. Dawes arrived here yesterday from Alexandra, Peck mining district, with two bars of silver bullion, containing 2500 ounces. This goes to San Francisco, through Wells, Fargo & Co. Mr. Dawes is lessee of the Peck mill and mine. The mine was flooded when he took it. It cost him \$8000 to raise the water out of it and put it in working condition. He kept up expenses by working tailings; is now in good fix to go on and will, we most sincerely hope, make a stake. He gives employment to about 50 persons.

## COLORADO.

**ORE.**—Georgetown *Courier*, Oct. 1: Reilly & Co., lessees on the Humboldt lode, Ute creek, are said to be taking out ore which returns 25 ounces gold and 40 ounces silver per ton. Stopping is going forward on the Detroit lode on sulphurets from one to six inches in thickness which mills 592, 176 and 117 ounces silver per ton, according to class. The Lewis placer, below Idaho springs, is yielding from 2 to 2½ ounces gold per day. The shaft has reached a depth of 35 feet. The underground working comprises 150 feet of tunneling. Chris. Turpin and W. W. Hickman are driving the tunnel steadily ahead for the Argentine lode, on Leavenworth mountain. They are now in over 200 feet, and soon expect to reach the objective point. The Blue Ribbon lode, at the head of Peck gulch, shows two distinct veins of ore in the bottom of the shaft—one of three inches and the other of eight inches—which mill \$400 and \$150, respectively, to the ton. A shaft-house is now in course of erection, preparatory to the work being prosecuted all winter. The Lone Star lode is being worked by the owner, Al. Penery. A shaft has been sunk on the vein 23 feet, the bottom of which shows a large vein of mineralized quartz which assays well. A Hartford five-ton smelting furnace will be among the improvements soon to be introduced in this county. The Wallace lode, near the Freeland mine, is yielding large quantities of ore valued at about \$130 per ton. The water has all been raised from the shaft and lower workings of the Centennial lode, preparatory to sinking the shaft further.

**IDAHO SPRINGS.**—*News*, Oct. 1: More mining activity on Fall river than we have noticed for years. Some leasers are taking out good-looking quartz from the Williams lode, Virginia canyon. The ro-stamp mill of the Plutus company is running constantly on mill ore from that mine. It is reported that an excellent body of ore has been struck in the Lake lode, Virginia canyon. The Bald Eagle, Virginia canyon, is working continuously and turning out some good ore. A party has taken a lease of the German mine, and is taking out the water preparatory to working it. The Ramage stamp mill, on Fall river, is running on the ores from a group of mines owned by Mr. Ramage. The parties owning the Rover lode shipped to tons of sacked ore to Denver Wednesday. This property is showing up splen-

didly. The Mona, recently purchased by Mr. Hills, an Englishman, is having T-rail laid, and a contract will be let to drive it in Bellevue mountain. One of the biggest strikes of gold quartz on record has been made in a certain vicinity. It beats the palmy days of the old Specie Payment. But mum is the word until further developments are made. The large new air compressor and receiver, with the necessary attachments, has arrived for the Plutus company, occupying four cars in transit. This machinery will be put in place as soon as possible by McFarlane & Co., of Central, and in less than thirty days will be in full working order. This is a new departure in economical mining; and using compressed air for pumping and hoisting purposes will be the means of saving a large sum annually in the item of fuel. When this huge machinery is in place it will be quite an interesting point to visit and watch its operation. The sale of what is known as the Arizona, No Name and Gonda mines, which has been pending for some time, was brought to a close by the paying of \$32,000 to Messrs. E. W. Williams, Edward Jones, Hugh Hughes and Owen L. Hughes, the owners of the properties.

## DAKOTA.

**COMING BONANZAS.**—Black Hills *Tribune*, Oct. 1: Among the many mines attracting attention as prospective bonanzas are the Retriever and Cambrian. These mines are located on the divide between Nevada gulch and Fantail gulch near Bald mountain. The mines are quite extensively developed by a system of cuts and tunnels. These workings show continuous bodies of ore of a high grade, carrying mostly gold. Assays made by S. F. Molitor, of Deadwood, return from \$30 to \$120 per ton. Two men have been working on the Cambrian for a month, and in that time have taken out and stacked on the dump over 40 tons of fine ore. The width of the chute is, as yet, unknown, but from indications good judgment places it at over 40 feet. If work is continued on this property, as no doubt it will be, a short time will suffice to place many thousand dollars' worth of ore in sight. A force of men is also working on the Retriever, and splendid results obtained. One cut on the north end of the claim shows a large body of ore. About 40 tons of ore is stacked on the dump. Further south a succession of cuts expose a continuous ore body for several hundred feet. At present the workmen are uncovering an ore body which has been developed by two shafts and which averages over \$50 a ton. It is from this portion of the ore body that shipments will shortly be made.

## IDAHO.

**SHEEP MOUNTAIN DISTRICT.**—Challis *Messenger*, Sept. 28: The Summit mine is about eight miles northwest of the old Cape Horn house, on the left of the trail from Cape Horn to Sheep mountain, and about 12 miles from Sheep mountain in a nearly south direction. The Summit is owned by Emanuel Bell, Geo. Baldwin, D. C. Kerlee and Jas. Cearley; is developed by a 20-foot tunnel, from which they have made a small shipment of 10000 ore. The Clayton smelter reduced it. The vein is 12 to 14 inches in width; although the whole of it is not so rich, it is all profitable ore for reduction. The country rock of all this region is granite. The Maggie D. mine, owned by Baldwin, Bell & Kerlee, is on the mountain north of the Summit, running nearly parallel, and possesses about the same characteristics as to walls, strike, dip, size, nature of ore, but has had less work done on it. The Bell, owned by Baldwin & Bell, is also another location on the same mountain, of the same quality of ore, and looks very fine for the amount of work performed on it. The Victor, owned by Baldwin, Bell, Cearley & Kerlee, is of the same nature. On the next mountain to the west is the Birdie R., owned by Baldwin, Bell & Hurlbut, of similar indications, that is, of late discovery. Also the 49, owned by Boulette & Lamenstein; new discovery. The Baldwin mine, owned by Baldwin & Bell, is of older location. Some rich rock was shipped from this mine last year, and this season a trainload was shipped to the Clayton smelter, which went about \$325 per ton. It carries some lead. Then there is the White Goat, owned by Baldwin, Bell, Kerlee, Watson & Faulkner, the croppings of which have yielded assays from \$248 to \$350 per ton; located this summer. The Sea Foam, located on the next ridge or mountain west of the Baldwin, about a mile and a half, owned by Post & Co., has some high-grade ore on the dump ready for shipment. This is the same grade of ore as far as developed; development small and by an open cut. The Josephus, lying about five miles west of the Baldwin mountain, was discovered this month by I. N. Daily, and owned by I. N. Daily, Sam Robinson, A. W. Wilson and W. M. Oster, and is the great find of the season as far as we are now advised. From the top showings this is really wonderful. It, like the other veins of this country, carries sulphurets and chlorides and lies in the formation usual to this part of Custer county. It has an immense body of float lying in exact line, covering a space of about 20 feet in width and extending, boldly, nearly 1000 feet in length. Assays of the rock run from 400 to 700 ounces.

**BIG MINING FLUME.**—Coeur d'Alene *Record*, Oct. 2: Wednesday night Civil Engineer Miller completed the survey of the big flume of the Coeur d'Alene Water and Mining Company from Sullivan to Buckskin gulch. The total length is 19½ miles, and when completed it will contain over 2,000,000 feet of lumber and will be one of the largest and longest mining flumes in the United States. It is already completed as far as the crossing of Bear gulch above Raven, and to-day, Thursday, the boxes are being laid there across the top of the big trestle 65 feet above the bottom of the gulch. The mill at Sullivan is now turning out lumber faster than it can be used by contractor McDonald's force of carpenters. He is still unable to get as many men as he wants to push the work.

**ORE.**—Davidson Bros. and Griff. Thomas, leasers on the Elkhorn mine, sold six tons of ore to the Philadelphia smelters this week. The six tons brought \$3500. Harry J. Murdock has bought his brother's—Geo. L. Murdock—one-fourth interest in the Ophir mine, Boulder. Harry now owns a one-half interest in this valuable mining property. He intends working the mine to every advantage, and take out ore as rapidly as possible. M. Carey was down from the Irving Tuesday. He reports the un-

covering of a fine ledge in the Alvia mine. It is over ten feet in width and a true fissure. It was estimated the ledge contained an extensive ore vein a few feet further ahead in the tunnel, which is being run as rapidly as possible. The Alvia mine is owned by Mr. Carey and T. E. Clohecy.

**SLAGGERS INSTEAD OF ROASTERS.**—Ketchum *Bulletin*, Oct. 2: Two more of the roasters at the Philadelphia smelters are undergoing repair and will be converted into slaggers. By this process the ore, after being thoroughly roasted, is melted and drawn from the roaster in the form of slag. It is claimed the ore is easier smelted after this improved treatment in the roasters. Hereafter, all the ores will be treated by the slagging process in the roasters.

## MONTANA.

**ANACONDA AND PHILLIPSBURG.**—*Inter-Mountain*, Oct. 2: From a gentleman just up from Anaconda and Phillipsburg several interesting pieces of mining information are derived. At Anaconda, Saturday night, the company commenced running two shifts in the construction of its new concentrator, and the force thus employed, added to that at work remodeling the old concentrator, increases the total to about 500 men. Anaconda, he says, is now as lively, or even more lively, than Butte. A gigantic new crusher is being placed in a position at the new concentrator. It is a ball crusher and has a crushing capacity of from 800 to 1000 tons per day when doing its level best. It is also a fact, he says, that the company is making changes in the interest of economy at the mine, and it is evident that it is getting ready to produce copper with a sufficient additional saving to enable it to compete successfully with the Lake region or any other copper country. It was mentioned a few days ago that \$50,000 had been offered by foreign capitalists for an opportunity to examine the Cable mine, with the privilege of buying it at a larger figure than had ever been offered for a mine in Montana. The figure was not stated at that time, but it is now understood to have been \$3,000,000. The property, as is well known (or rather believed, for its secrets are never made known) is of fabulous richness and extent—30 feet of \$40 gold ore for the most of the way along the vein for 3200 feet, the extent of development. The offer, large as it was, was promptly refused. Gov. Hauser and other Helena capitalists last week paid \$60,000 cash for a quadruple claim parallel with and adjoining the Cable property. The Pyrenees mill is running steadily on ore from the deepest level (the new one), which is 125 feet below the one from which all previous ore worked has come. West Granite developments go steadily on, but what there is at the inner end of the workings has not been made public. The Blue-eyed Nellie, near Anaconda, keeps up its regular shipments of rich ore.

**STRIKE IN THE LEXINGTON.**—*Inter-Mountain*, Oct. 1: Within the past few days a very rich but singular discovery has been made in the Lexington. It has always been a silver mine. For ten years it has been a steady producer of silver ore. On the 800-foot level, where prospecting has been active of late and where a shoot of the usual character of ore was expected, a body of distinctively copper ore has recently been struck. The size of the strike has not yet been developed. The ore is a pyrites and beautiful color and assays from 25 to 30 per cent copper, and about 80 ounces in silver. Of course it can only be treated by smelting. The discovery dispels the idea that copper may not abound at great depth under all the silver mines in the vicinity of Walkerville. The freak of the Lexington is as interesting as it is important.

## OREGON.

**PLACER AND QUARTZ.**—Jacksonville *Times*, Oct. 1: Miners are generally making preparations for the coming season. The ore in the Hope ledge on Wagner creek is improving as work progresses. There is considerable activity in the Wagner Creek district, and ledges are still being located. The Chinese who have wingdammied Rogue river, near Galice creek, are said to be doing well. Parties from the East have been on Grave creek, inspecting several mines, with the intention of investing. Jack Layton has done well in his mines on Farris gulch this season, and is making preparations for the next. The Sterling Mining Co.'s ditch has been cleaned out, the flumes repaired, and everything will soon be in readiness. L. D. Brown's quartz mill is being put up on the site of the Swinden ledge, and will soon be ready to commence crushing quartz. Keaton, Klippel & Co. are drifting the ground they bought of N. S. Drew on Applegate, and seem well pleased with their prospects. More interest is now being taken in trying to develop quartz mines in and about the vicinity of Canyonville than formerly. Many apparently good prospects are being found. Hopkins & Moon will soon put up a quartz mill on Wright's creek, to thoroughly test the quartz ledge Messrs. Patton have discovered on the ridge north-west of Ashland. McKee & Co., of Forest creek, who are mining in the Elliott Creek district, have struck some excellent prospects, and expect to take out considerable gold dust before snow falls. All the machinery for Baume, Klippel & Co.'s quartz mill is on the ground, and will soon be in running order. The arastra, which will crush the blanket tailings, is now being constructed. J. N. Casteel has bonded the real estate on Forest creek belonging to the Hopkins estate for \$1000, and will immediately put it in shape for the coming mining season. It is supposed to be rich in precious metals. The tunnels being run into the Sugar Pine ledge on Galice creek by the parties who have bonded it are progressing rapidly, and there is every prospect of Green Bros. receiving the large sum of money for their property which it is worth. Alex. Watts was in Jacksonville Wednesday, from whom we learned that he was busily engaged in getting his mines in Josephine county, near Kerbyville, ready for winter. He has finished digging a ditch, and purchased the hydraulic pipe formerly used by Keaton & Klippel on Poorman's creek. The mining interests of Jackson and Josephine counties are looking up. Not only the placers, but the quartz mines, will soon receive the attention they deserve, and more solid work than ever will be done in the near future, when it will be definitely ascertained if our mineral resources will not warrant the investment of a large amount of capital.

## NEW MEXICO.

**BONDED.**—Silver City *Enterprise*, Oct. 1: Messrs. Irwin & Corbett, who have their mine bonded to J. H. Flagler, got returns from a 30-ton shipment of ore that netted them \$600 last week. These gentlemen have a group of claims that are attracting universal attention in mining circles. Mr. Kohlenberg, the principal owner of the Telegraph property, although a little discouraged at the loss inflicted by the big flood on the Gila to his dam and flume, is not a man to sit quietly down and brood over his misfortune. He has started to build a 300-foot dam across the widest place in the river near his property. This will be such a substantial piece of work that a dozen such floods as the last one can have no effect upon it. Six weeks will be consumed in building it, at the end of which time the mill will resume full operations. Mr. Comstock, an experienced mining man, arrived here lately to take charge of the Peerless mine. He started up the property on Monday with a force of eight men, which he will increase from time to time as he can do so with advantage. Although the ore showing at present upon this claim is not extensive, the mine is one of the most promising in Grant county. It is understood that Mr. Comstock has carte blanche to work it extensively.

**HERMOSA.**—*Black Range*, Oct. 1: Reavis & Foster made a shipment of ore from their lease on the Eagle this week. Beebe & Dunn also made a shipment of Antelope ore. Both shipments of ore are of high grade. The late floods carried away the flumes of Ledford's concentrator, which have been replaced and is now running steadily. The nine tons of ore lately shipped from the Palomas Chief gave returns of over \$300 per ton in silver and a good percentage in gold and lead. The Chief is looking well and has plenty of good ore in sight. Frank Reavis discontinued work on his Eagle lease, and is about to commence work on his Small Hope property. The Small Hopes make an excellent showing, and Frank will strike it rich. Mr. Marshall is working a newly discovered prospect from which he is taking out \$500 ore. J. H. Drake has purchased Geo. Leaming's interest in the Argonaut-Consolidated mine. Mr. Drake and Mr. Dunn are now equal owners in this property, which contains a good body of low-grade ore with kidneys of 365 ounce ore scattered through it.

## UTAH.

**SANDSTONE MINING NOTES.**—Southern Utah *Times*, Oct. 2: James Mutton has resumed work on the Annie. Thorne & Hurley are working the Vanderbilt mine, which is looking first rate. Al Hartman has drawn out of the Annie lease, and is prospecting on the Stormont. Bailey & Nesbit are making a good shipment of ore to their leachers, from the Bonanza mine. Dick Jarman and J. B. Smith are opening out the Emma, which is showing up in good shape. The Nesbit, Bailey & Co. leachers had to suspend operations for several days on account of delay of chemicals. Taylor & Lambson have leased a portion of the Leeds mine, and are taking out a lot of ore to work at the leachers. Henry Holland has out about eight tons of fair-grade ore extracted from the Silver Gate mine, which will be manipulated by the N. B. & Co. leachers. In consequence of some important connections having to be made in the Buckeye, the Stormont laid off 15 miners on Sept. 27th, the rest of the force being deemed sufficient. Oct. 1st, the River mill closed to remain inactive for 30 days; the daily shipment of ore to the mill will be continued on a curtailed scale. As soon as the necessary improvements are made work will resume as before. Erroneous reports are afloat concerning the wage cut in the Reef. The facts are as follows: The Christy is the only company which enforced the cut. This company in the first place announced a four-bit cut, to take effect on a certain day, whereupon most of the miners quit work and were replaced by new men at the old wages. September 15, without warning, the company again announced the cut and put it into effect at once. As I understand it, most of the new men stayed with the cut, and the Christy mines and mill are being operated by a full force. The first reduction was announced in connection with a promise of a restoration of the \$3 rate as soon as silver advanced to \$1.

**IMPROVEMENTS.**—Park *Record*, Oct. 2: The grading of the steep hillside, preparatory to erecting the contemplated hoisting works and new buildings of the Crescent, is going ahead. The grading will be finished long before winter sets in. Another improvement is the work of conducting water from the head of Thayne's canyon to the Crescent mine for culinary and machinery uses.

**THE NEW SHOPS.**—Thursday morning a force of masons and laborers was set to work grading and laying the foundation for the new mechanical shops of the Ontario and Daly Companies, just south of the Marsac mill. The main building will be 30x124 feet in size, and will be used for the principal machine and carpenter shops of the two companies. In the building 12x22 feet will be the electric-light dynamo to be run by water power. The old No. 4 works of the Ontario are being torn down, and the material is to be used toward constructing the new buildings, which will be pushed toward completion with all possible speed.

**CAMP CROSSCUTS.**—The entire force at the Anchor mine has been laid off temporarily; but three men, however, are clearing up things for the reception of the two large boilers which are expected to arrive from the East at any day. In a few weeks work will be renewed, and it will not be long before the dropsical mine will be relieved of the surplus water. J. M. Kennelly has put a few men to work on the Great Basin mine. Everything is going on with clock-work precision at the Ontario, Daly, Sampson, Crescent and Apex mines, and, of course, good results are forthcoming.

**ORE AND BULLION SHIPMENTS.**—For the week just ended the Mackintosh sampler received 498,760 pounds of Ontario ore, 152,750 pounds of Daly and 112,530 pounds of Sampson ore; total, 764,040 pounds. During the week the Crescent shipped 325,889 pounds of concentrates and 189,700 pounds of first-class ore. The Daly bullion product from the Marsac mill for the week was seven bars, containing 7879 fine ounces of silver. The output of Ontario bullion for the week was 31 bars, containing 18,493 fine ounces of silver. Add Dakota

THE CONSUMERS' COMPANY.

**VULCAN B B AND AJAX.**

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

 350,008.—CASTRATING INSTRUMENT—J. Trullinger, Silverton, Ogn.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Quartz But Not Gravel.

In the Superior Court, on the 4th inst., the County of Sacramento obtained an absolute injunction against J. B. Hobson for hydraulic mining on the American river, or allowing others to thus mine his mine, or to use the water thereof for hydraulic mining purposes. Soon after, Wm. Singer, Jr., representing the defendant, appeared before the Board of Supervisors, and they passed resolutions to the effect that Hobson would not be molested so long as he confined his operations to quartz or drift mining. The resolutions contained the following:

Whereas, the said J. B. Hobson has consented that judgment may be entered against him enjoining him as prayed for in the complaint in said action without costs, and his attorney represents that the said J. B. Hobson will not mine by the hydraulic process;

Now this is to assure the said J. B. Hobson that the County of Sacramento will not in the said suit prosecute the said J. B. Hobson for contempt, provided he mines only by the quartz process or the drift process, as now conducted and understood; and will not prosecute him for contempt if he mines by the sluice process, if running by the said sluice process he does not deposit in the American river or any of its forks, ravines, or tributary streams, any tailings, boulders, cobbles, gravel, sand, clay, debris, or refuse matter from mining ground, or allow others to do so, or allow his water supply to be used therefor, and shall not in any instance do any of the damages complained of; it being understood that the said plaintiff desires to obtain the result prayed for in the complaint, and will not prosecute said defendant so long as he does nothing to affect the result obtained by the injunction in said case.

## Mining Share Market.

The announcement that operations below the 2400-foot levels on the Comstock have been suspended is a severe blow to the stock market. The lower levels are to be stripped of machinery entirely, and work there abandoned. The Combination shaft is down to 3255 feet, and was sunk by the Chollar, Norcross and Savage Companies. The Savage have refused to pay their share of pumping expenses; hence the shut-down.

A prominent superintendent authorizes the statement that the shut-down will not be so disastrous as represented; that it is only temporary, and that negotiations are pending for the immediate starting up of the pump at the Yellow Jacket new shaft, the expense to be borne jointly by the Potosi, Alpha, Exchequer, Crown Point and Belcher. This will relieve the burden of the cost of draining, now borne solely by the middle mines.

He further stated that extensive prospecting operations will be inaugurated in the Chollar and Potosi mines above the 2400 level, and that the management of the Gold Hill mines are determined to drain the flooded levels for the purpose of thoroughly prospecting the 2700 level in the Belcher.

The following mines report cash on hand on the 1st inst.: Belcher has \$345,691; Bodie Tunnel, \$87,813; Crown Point, \$25,823.01, with an overdraft at Virginia City of about \$69,207.01; Con. Imperial, \$528,011; Dudley, \$14,671.10; Humboldt Hill, \$987,661; Manhattan has assets to the amount of \$43,729.32; Syndicate, \$417,295; Union, \$509,511.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. Virginia and California, Oct. 3, \$25,941; Moulton, Sept. 28, \$11,000; Marget Ann, 28, \$45,821; Lexington, Oct. 1, \$20,954; Germania, Sept. 28, \$36,241; Queen of the Hills, 28, \$28,901; Germania, 29, \$11,439; Alice, 29, \$14,762; Hanauer, 30, \$54,301; Stormont, 30, \$29,651; Hanauer, Oct. 1, \$25,601; Queen of the Hills, 1, \$36,001; Germania, 2, \$17,890; Hanauer, 2, \$25,280; Queen of the Hills, 2, \$13,350; Silver Reef (for September), \$28,619; Hanauer, 3, \$52,601; Queen of the Hills, 3, \$19,701.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
 G. W. INGALLS—Arizona.  
 E. L. RICHARDS—San Diego Co.  
 R. G. HUSTON—Montana.  
 FRANK W. SMITH—Nevada and California.  
 GEO. McDOWELL—Fresno and Tulare Cos.  
 O. F. BERGMAN—Tehama and Colusa Cos.  
 J. S. LANTON—Nevada, Sierra and Plumas Cos.  
 SEANNETTE HOUGHTON—San Mateo Co.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## Take a Receipt.

ALWAYS TAKE A RECEIPT from a newspaper agent. Not simply because a few out of many are tricky or careless, but because accidents will sometimes happen to the best of business men. It is a favor due to the publisher that every subscriber shall take a receipt from the agent, or clerk whom they pay. All our receipts have a corresponding stub which agents are accountable for and are required to return.

EL CALLAO mine, at Venezuela, produced \$293,000 in gold in July, from which a dividend of \$6.20, or \$257,600, was paid in London.

THE Small Hopes Consolidated mine paid a dividend of \$50,000 September 29th, making \$537,500 this year and \$2,276,500 since the beginning.

THE Idahoan mine, at Hailey, Idaho, paid a dividend of \$12,000 on the 17th of September, making a total of \$80,900 this year.

THE Honerine mine paid a dividend of \$12,500 on the 28th of September, making \$75,000 to date.

## About Obtaining Patents.

## Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

## Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fees. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$80 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

## Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

## Advantages to Inventors on the Pacific Coast.

## Books on Assaying.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.  
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

## Practical Hydraulics.

By P. M. RANDALL.

## A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of elaborate calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

## Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated, and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco.

## COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 252 Market St., San Francisco.

## WANTED!

Man of Capital and Mining Experience to buy a number of claims, all in the hands of prospectors. Three Locations on same vein, 10-25 feet; formation, slate hanging, granite footwall; assays from \$10 to \$90 per ton in gold and silver, with a little copper in it. Can be opened and worked with tunnels to a depth from 400 to 2000 feet. Plenty of water and densely timbered. Title perfect. About 20 miles from N. P. R. R., Montana. No Reduction Works in the vicinity. Will bear close investigation. Great chance for practical mining men of some means. Price, \$30,000. For further particulars, address

J. W. LIND,  
Marysville, Lewis & Clarke Co., Montana.

—MANUFACTURERS OF—

## RUBBER GOODS.

Patentees of the Celebrated "MALTESE CROSS" Brand Carbolized Hose.

TRADE MARK.

The Best Belting for Threshing Machines is our MONARCH RUBBER BELTING, made with Cotton Stays or Flexible Rivets.

We have also the Patent RED STRIP Rubber Belting, and our Superior STANDARD Rubber Belting. Send for Price List of kind wanted.

JAMES F. HOUGH, General Manager of San Francisco and Portland, Or., Branches 15 and 17 FIRST ST., near Market, SAN FRANCISCO, CAL.

## DELINQUENT NOTICE.

Truckee Ice Company.—Location of principal place of business, San Francisco. Location of works, Martis Creek, Nevada county, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment (No. 1) levied on the 1st day of September, 1886, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
McAulay, F.....	Not issued.	200	\$2000 00

And in accordance with law, and an order of the Board of Directors, made on the 1st day of September, 1886, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, in San Francisco, on Monday, the 25th day of October, 1886, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

GEO. W. SCOTT, Secretary.

OFFICE—202 Sansome St., room 4, San Francisco, Cal.

## DIVIDEND NOTICE.

OFFICE OF THE

Paradise Valley Mining Company  
San Francisco, California.

At a meeting of the Board of Directors of the above-named company, held September 29, 1886, Dividend No. 9, of Twenty Cents (20c.) per share, was declared, payable on Thursday, the 30th day of September, 1886, at the office of the company.

W. LETTS OLIVER, Secretary.

OFFICE—No. 323 Montgomery Street, San Francisco, California.

## A Good Opportunity for a Mechanic.

A variety of good Tools, Patterns, etc., with business for sale cheap by a party retiring from business. A splendid opportunity for an enterprising mechanic.

Address A. B. O., care of this paper.

## San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS &amp; CO.

411 and 413 Front St., San Francisco

## WANTED.

To exchange one-half interest in three mining claims, in Montezuma District, Sonora, for a reasonable amount of money, to be used in developing said claims. One claim has paid a fair profit for over a year. The capture of Geroumo and band by Gen. Miles makes this the safest investment on this coast. For further particulars, address

J. E. BICKERTON,  
1069 Grove St., Oakland, Cal.

AUGUST LUTZ,  
METAL SPINNER,

10 Stevenson St., 3d floor, S. F.

The only custom work spinner in the city. Personal attention given to all work. Orders respectfully solicited.

San Francisco, Cal.

### THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use.  
It has fewer parts, requires less power, is simpler in  
adjustment than any other. Feeds coarse ore or soft clay  
alike uniformly, under one or all the stamps in a battery  
as required.

In the Bunker Hill Mill it has run continuously for two  
years, never having been out of order or costing a dollar  
or repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

237 First Street, San Francisco, Cal.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold  
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.  
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting  
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,  
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded  
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-  
ties to suit purchasers.

BALFOUR, GUTHRIE & CO.,

316 California St., San Francisco.

## FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 220 Fremont St.,

San Francisco.

MANUFACTURERS OF

BABCOCK & WILCOX BOILERS.

## ENGINES AND BOILERS

OF ALL KINDS,  
Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish  
Tanks for Salmon Canneries  
OF EVERY DESCRIPTION.

Boiler Repairs promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines, Babcock and Wilcox Boilers,  
Tustin Ore Pulverizers.

MARINE ENGINES AND BOILERS—  
Propeller Engines, either High Pressure  
or Compound, Stern or Side-wheel En-  
gines.

MINING MACHINERY—Hoisting En-  
gines and Works, Cages, Ore Buckets,  
Ore Cars, Pumping Engines and Pumps,  
Water Buckets, Pump Columns, Air Com-  
pressors, Air Receivers, Air Pipes.

MILL MACHINERY—Batteries for  
Dry or Wet Crushing, Amalgamating  
Pans, Settlers, Furnaces, Retorts, Con-  
centrators, Ore Feeders, Rock Breakers,  
Furnaces for Reducing Ores, Water Jack-  
ets, etc.

BABCOCK AND WILCOX BOILERS.

## THE ORIGINAL Roller Ore Feeder.

This form of Ore Feeder is well adapted  
for its peculiar work.

In reference to a similar form of "Roller" Feeder,  
which is being manufactured and offered for sale in this  
city, and of which a cut appears in this journal, we have  
to say that the Superintendent of the Bunker Hill Gold  
Mining Company states that the "Challenge" is far su-  
perior to the "Roller," he having had both of them  
operating side by side. We shall be pleased to show this  
letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and  
"Stanford Improved."

Prices furnished by the

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco.

### ORE FEEDERS.

We direct attention to an advertisement, which ap-  
pears in our journal, of the "Original Roller" Ore  
Feeder, manufactured by the "Joshua Hendy Machine  
Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder,  
known as the "Templeton Roller," claim that it is su-  
perior to any other style, and cite those in operation at  
the "Bunker Hill" mill in Amador county, we expressly  
contradict the statement, and in substantiation submit a  
copy of a letter shown to us by a representative of the  
"Joshua Hendy Machine Works," which speaks for itself

BUNKER HILL GOLD MINING CO.,

AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont  
St., S. F.—GENTLEMEN: We have used the "Challenge"  
and "Roller" or "Templeton" Ore Feeders in our mill for  
the past three years, and I am free to say that I con-  
sider the "Challenge" far superior to the "Roller."  
Feeder, in that most important of all things in a quartz  
mill, namely, the regular feeding of ores to the bat-  
teries. If the "Roller" Feeder is regulated to feed finely  
pulverized ore, the coarser ore will choke the outlet of  
the Feeder, and no ore can reach the batteries. If, on  
the other hand, it is regulated to feed coarse ore, then  
the fine ore when it comes will slide right through and  
fill the batteries. The "Roller" Feeder requires constant  
attention. Yours truly,  
(Signed) N. W. CROCKER, Supt.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), London, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1880; December 22, 1874; September 2, 1870; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

## BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## THE JAMES QUARTZ MILL

Saves a Higher Percentage than any other machine.

Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the **WHOLE WEIGHT and FORCE OF BLOW ACTS ALTERNATELY ON EACH DIE.** In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.****E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR &amp; CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## Sluices.

A miner's sluice is a trough or box through which gravel or dirt is washed; and a flume is a wooden structure for water only. The facility with which gravel can be moved depends mainly on the inclination which is given to the sluice, and the question of grade is therefore of the greatest importance. Experience, thus far, has led to the adoption in most localities of what is called a 6 or 6½ inch grade, meaning 6 or 6½ inches to the box, 12 feet long, or, say a 4½ per cent grade. In some places in this State, where large quantities of pipe-clay are washed off, 9 and 12-inch grades to the box are used (6 to 8 per cent). In others, on account of natural obstacles encountered, a 1½ per cent grade, or 2½ to 3 inches per box of 16 feet, is used. Mr. Aug. J. Bowie, in his work recently published on "Hydraulic Mining in California," speaks as follows of the grades of sluice-boxes:

Light gravel containing clay or earthy matter can be moved on an easier grade and with less water than heavy gravel; nevertheless, when a 4½ per cent grade can be obtained, it is desirable, as it lessens the labor of handling rocks and more material can be washed. Moreover, as light gravel is generally poor in gold, this deficiency can be made up only by washing large quantities. Light gravel requires that the water should be run with sufficient force to carry off the rocks washed through the sluice, and yet be only of sufficient volume to prevent the packing of black and heavy sand. If too much water is used by superincumbent pressure, the sand drops and packs the riffles.

The best results are obtained with shallow streams on light grades. Coarse gravel demands from four to seven per cent grades and a proportionate increase of water. In washing this heavy material the water in the sluice should be deep enough (10 to 12 inches) to cover the largest boulders ordinarily sent down. As a large volume of water is sent through a sluice running heavy cement gravel, more material can be transported and washed if a proper proportion of light and heavy gravel is made. The rocks and cement, as discharged into the sluices, keep the sand stirred and prevent its packing, while the cement, rolling along the sluice, is disintegrated. With scarcity of water and heavy material, at some places in California they have used a grade of 10 to 24 inches per 12 feet.

The size of a sluice depends on the grade, character of gravel and quantity of water to be used. A sluice 6 feet wide and 36 inches deep, on a 4 or 5 per cent grade, will suffice for running 2000 to 3500 inches of water. One 4 feet wide, 30 inches deep, on a grade of 4 inches to 16 feet, will suffice for 800 to 1500 inches of water, and on a 4 per cent grade it is large enough for 2000 inches. A sluice 3 feet wide and 30 inches deep, with a 1½ per cent grade, is suitable for 600 to 1000 inches. As to length, the principle is to construct the line sufficiently long as to insure the most complete disintegration of the material, affording ample surface for the grinding of the cement and the best facilities for the gold to settle in the riffles. The length of the sluice should be governed by its yield, the rule being to keep extending the sluice so long as the yield exceeds the expense.

The following details of construction will be useful to miners, as they give the results of long experience in California. Sluices of a width of

4 feet and upward are made of 1½-inch or 2-inch plank, with sills and posts of 4x4 or 4x6-inch scantling. To guard against leakage of quicksilver, it is important that the bottom be tight. To secure this the bottom planks should be of half-seasoned lumber, free from knots, and the joints grooved, and a dry, soft pine tongue inserted. The bottom and sides are spiked together with

To avoid this the flume should be heavily weighted down by loading the ends of the sills with stones. In tunnels, the ends of the sills can be held down by braces extending to the rock overhead.

The annexed diagrams give the detailed construction of the tunnel sluice-box which was used at the North Bloomfield mines, the

SLUICE FOR GRAVEL MINING.

nails 4 inches apart. It is not necessary to plane either bottom or side planks. In many cases the planks are simply fitted well and closely nailed together.

The sills are placed from 3 to 4 feet apart, depending on the size of the scantling used, which is regulated by the width of the sluice; thus, a 4-foot sluice would require a sill 7 feet long, of 4x6 or 4x4-inch stuff. The posts are halved into the sills and firmly spiked, and every second or third post should be supported by an angle-brace. The bottom planks should be solidly secured to the sills by a liberal use of heavy spikes. The bottom of a new sluice is liable to be raised by the pressure of the water which collects under it and finds no discharge.

largest hydraulic mine in this State. The box is 6 feet wide, 12 feet long, with sides 32 inches deep. To each sluice-box was used:

8 posts.....	4 inches x 6 inches x 3 feet 2 inches.
4 sills.....	4 " 6 " 8 "
3 bottom planks..	2 " 24 " 12 "
4 side planks.....	1½ " 16 " 12 "
2 top rails.....	2 " 8 " 12 "
16 braces.....	2 " 4 " 2 "

On the outside of the tunnel the sills and braces are larger. The nails in the bottom are 30 penny; for the sides, 20 penny. The side lining, composed of worn blocks when available, is 3 inches thick, 18 to 20 inches deep, and is set 2½ to 3½ inches above the bottom. The riffle strips, between the blocks, are 1½x3 inches and 5 feet 11½ inches long. The blocks are 13 inches deep and 20½ inches square, and aver-

age about 19 to the box. When stone riffles are used, the bottom of the sluice is lined with rough plank. The top sluice on one side is for carrying seepage water when the blocks are being set. It is 13 inches wide and 14 inches deep, and is made of 1½ inch plank.

At the LaGrange mines, Tuolumne county, in this State, a sluice-box 4 feet wide, 32 inches deep and 16 feet long, is built as follows:

4 sills.....	4 inches x 6 inches x 7 feet.
2 end posts.....	4 " 6 " 8 " 2 inches.
6 intermediate posts	4 " 4 " 3 " 2 "
16 braces.....	1 " 6 " 3 " "
2 bottom planks..	1½ " 24 " 16 "
4 side planks.....	1½ " 16 " 16 "
2 side linings.....	1½ " 8 " 16 "
2 top rails.....	1½ " 8 " 16 "
12 riffle bars.....	1½ " 2 " 4 "

This aggregates 420 feet of lumber. There were 36 blocks, 14 inches square and 8 inches deep.

To each box 15 pounds of nails are used, viz.: 12 nails, 10-penny, side lining to sides; 160 nails, 12-penny, braces to posts and sills; 40 nails, 20-penny, posts to sills; 76 nails, 20-penny, sides to bottoms; 36 nails, 20-penny, blocks to riffle bars; 32 nails, 20-penny, bottom sides to posts; 64 nails, 20-penny, top sides to posts; 50 nails, 30-penny, bottoms to sills; 50 nails, 30-penny, top rails to posts and sides.

The cost was, per box:

420 feet of lumber, at 3 cents per foot.....	\$12 60
36 blocks, at 35 cents.....	12 60
15 pounds nails, at 4½ cents.....	64
Labor, at \$1 to \$2.50 per day.....	2 50

## Magnesium for Lighting Mines.

Magnesium is an element which has several times been tried and abandoned as a source of artificial light. It now, however, appears likely to come into use again, as a process has been discovered whereby pure magnesium can be economically prepared by electrolysis. At the works in Bremen, where the manufacture is conducted, prizes have been offered for the construction of a magnesium lamp, with clock-work attachment.

Light from this source is perfectly steady, unlike the arc electric lights. By its means colors—even the dark blues and blacks—may be distinguished at night. If the new process of preparing this metal is as successful as promised, it may before long be used for lighting mines, for which it is much better adapted than electricity. Wires in mines are bad, and if any accident happens to the dynamos or main wires, the whole mine is suddenly left in darkness. Moreover, there is danger to the men from the wires.

The magnesium light approaches very much nearer the color of daylight than that from oils, candles or gas, though it does not equal the electric light. It gives off no noxious vapors. Several kinds of magnesium lamps are made. In some a wire or ribbon of the metal passes through the flame of a spirit-lamp to insure continuous combustion. In others the magnesium is used in the form of dust and fed to a flame. The light has been used for photographic purposes, both in rooms and underground.

THE Hasting 20-stamp mill, on Queen creek, three miles from Pinal, Arizona, cost about \$75,000, and was bought recently for \$3000, by the Walker Bros., who will utilize the machinery at their Vekol mill.

SOME selected ore from the Drum Lummon mine, M. T., milled out \$13,000 the other day.

## Wood River.

## Deep Mining an Assured Fact—The Minnie Moore.

[Written for the Press by our Traveling Correspondent, FRANK W. SMITH.]

Wood River has been written up "sky-high," time and again, and many and marvelous are the "yarns" that have been "spun" on this wonderful country. Notwithstanding the fact that many and able writers and not a few artists have spread Wood River over the face of the earth, as it were, it is peculiarly a country that to be appreciated it must be seen. The mineral resources of the Wood River country have proved to be of a deep and lasting nature, and the grade of the bulk of its ores has been of an excellent and paying character.

## Diversified Resources.

It would take pages to properly portray the many resources of this great district. Briefly: The leading industry is mining, followed next by stock-raising and agricultural pursuits. Mining, of course, receives the most attention, and the blame for the neglect of many profitable ventures in agricultural interests can be laid at the door of this greatest species of gambling man ever was prone to indulge in—mining. Stock business, being easier and faster in making returns than farming, has been taken up by many, and to-day Wood River, as a stock range, is claiming a share of the notoriety heretofore accorded to mines and mining only. The soil, climate, and other advantages of Idaho in general, and Wood River in particular, are equal and, in many cases, superior to numerous otherwise more favored localities. While the mining districts of this much-talked-of and widely-advertised country have produced and are producing millions, yet there are large districts of unexplored and many poorly prospected regions that will pay well to locate and develop.

## The Mines.

To describe the mines of this district would be to write a book, and a big one at that. The ores are principally argentiferous galena, with some gold and copper-bearing formations discovered, but as yet the two latter minerals have not been either properly or extensively developed. Silver being the first mineral found, every prospector and mine-owner has sought for that metal, ignoring indications of gold that elsewhere would have created booms and paid big for legitimate working. It was "go with the crowd," as it were, notwithstanding the falling silver market and the expensive working of these ores. To-day there are a number of "gold districts" in the Wood River country that would pay handsome returns for less money than silver mines require. Among the leading mines of Wood River is the

## Minnie Moore Mine.

This property is "the belle" of Wood River silver producers. It is situated about one and one-half miles from Bellevue—the most promising mining camp of Alturas county. The lode is argentiferous galena, exceptionally large in size, rich in grade, and more depth and regularity than any silver mine of the West. The property is now managed by Thomas Charimical, who appears to thoroughly understand the situation, and is pushing work in a manner gratifying to miners and mining men. The development of the Minnie consists of levels, winzes and inclines on the dip of the ledge. Many of these are in on ore, the greater part of which is first-class. During four months the mine produced \$140,000 doing only development work, taking out jigging ore, leaving the first-class standing in the mine. To-day there is estimated, and I believe correctly so, over 600 feet of ore body standing in the many levels that will average from two to four feet in thickness and will run \$160 per ton. The concentrates run \$130 per ton. Adjacent to the mine a large concentrator has been erected and is running day and night on jigging ore. A visitor to this fine property seeing the vast and rich ore body standing in nearly every level is impressed with the idea that the mine is either on dress parade or that the management is making the low-grade ore pay expenses and holding the richest till there is a raise in silver. The deeper the Moore has been driven the more firm the vein has become and the richer the ore. The development of this mine has proved beyond all doubt that Wood River mines go down with a better showing than on the surface, and that deep mining in these deposits will stand the test. The fall in silver only will keep Wood River from being a great silver district and the Minnie Moore from being the biggest mine of the kind in the United States. To properly describe the Minnie and credit the present management with the praise merited, would require more time and space than can here be given. The latest assays on ore taken from the lower levels show an improvement in grade that is highly gratifying, as follows: Five assay 83.68-100 per cent lead and 133.68-100 ounces silver.

## Bellevue Concentrates.

The Minnie Moore ships 15 tons concentrates daily to Salt Lake.

The Bellevue Herald is a paper worthy of the support of the camp.

The Queen of the Hills ranks as the second best mine of the district.

Hailey, the county seat of Alturas, is only

four miles distant. Hourly stages make trips. Fare, 50 cents each way.

Other mines and camps will be treated in these columns in due course of time.

The "Short Line" runs a train daily, except Sunday, on the Wood River branch.

The International hotel is presided over by a most popular hostess, Mrs. Collins, late of Iowa.

There are some 12 or 15 saloons in camp, and every one of them is located on one side of the street.

Hailey, the county seat, is jealous of Bellevue, and well it may be, for the latter is not only making friends, but business, daily, and it is so situated that it bids fair to outstrip the former should its present prosperity continue.

## Arbitration.

To the average mind nothing seems more strange and inexplicable than the conflict between law and common sense in the law courts of the land. Submit any question of dispute to a few practical business men and they will settle it promptly on just and equitable business principles. Submit the same controversy to the arbitrament of a court, and common sense is straightway turned out of doors. The whole case is soon entangled in such a mesh of inscrutable technicalities of pleading and evidence that the parties to the controversy can scarcely recognize their own case. It is a well-known fact that justice does not always insure a verdict. The whole case may go off on an absurd technic. Judge Edward A. Thomas, in an article contributed to the *North American Review*, says: "Justice should be meted out with certainty, economy and promptness. Under our present system this cannot be done. The system itself is antiquated and unreliable, expensive and cumbersome. Litigation is feared and avoided by merchants, bankers and others on account of the delay, uncertainty and great expense which it entails."

The advantages of arbitration as a mode of settling disputes among business men are great and many. The arbitrators are the immediate choice of the parties and may be selected for their known integrity and intelligence. They hear a statement of the case, the evidence, and analyze and decide with the habits, instincts and tact of business men aiming to do what is fair and just between the parties. There need be no tedious delay, no unnecessary expense. The advantage of arbitration is no theory. The Boards of Trade in all our large cities have their courts of arbitration for settling disputes among the members. It is the rule among the Grangers, and the report is that troubles are promptly and satisfactorily settled in this way. A large class of cases may always have to be adjudicated in courts of law, but it is nevertheless true that many controversies may be settled more promptly and with less delay and expense out of court. Litigation is too slow, too expensive, too vexatious, too uncertain and too unjust to satisfy the average business man of to-day, and it is a good sign of the times that arbitration is growing in favor.

**ANOTHER SAFETY DEVICE.**—John Williams, a practical miner on the Comstock for years, as well as in Candelaria, California, Montana, Idaho and the old country, has invented a safety device to be attached to mining-shaft cages. It is intended as an improvement upon the safety clutches now in general use to prevent a cage from falling in case of breakage to the cable, causing the same automatically to act, especially in case of an unclutched reel, or a long line of broken cable lashing from side to side in the shaft, keeping up the tension on the kingbolt. In this device a stout chain placed over a set trigger holds the safeties in place independent of the kingbolt, so long as only the regularly required speed is used, but should it suddenly attain an extraordinary speed through breakage of the cable, a heavy hammer hits the trigger, knocking it and the chain loose, forcing the safeties to act immediately, arresting the fall of the cage. This hammer is hung on a pivot or upright shaft whirling around above the crosshead of the cage after the style of a "governor" of an engine, caused to do so by rollers of its own operating against the cage guides. Thus an undue rate of speed will cause the hammer to swing higher by centrifugal force, and strike the trigger, releasing the spring of the safety clutches and forcing them to operate instantly in arresting the fall of the cage. The device is a new and interesting one, works perfectly and commends itself to all mining engineers or others interested in such really important matters. Mr. Williams has a working model of his invention. —*Virginia Enterprise*.

**A BIG DAM.**—The Santa Cruz Sentinel says: "From A. F. Green, of Milbrae, who is in charge of the working forces of the Spring Valley dam, located up the San Mateo creek and back of the town of San Mateo, we learn that the work is being crowded ahead. The dam will be 161 feet high, cost \$1,250,000, and be five years in course of construction, forming a lake seven miles long and in one place a mile and a half wide. Excavations are being sunk to the bedrock across the creek and from point to point, and a bed of composition will be laid from the rocks to the water level of the lake that will make leakage next to impossible."

## American Industries—Their Future.

There is no sentiment in business—"business is business," the world over. Individuals transact business with each other from a purely business standpoint. Nations, in their transactions, are governed by the same universal principle. A New Zealand correspondent of the London *Ironmonger*, in explaining why the people of that island prefer Yankee-made iron and steel goods to those of English make, says:

"We should prefer to do business with you, but you must not ask us to take badly-finished, old-fashioned goods, which, no matter how they satisfied our forefathers, will not do for us. Would you be surprised to hear that no carpenter in New Zealand will use from choice an English hammer, saw, brace, or auger-bit? No buggy-builder will use English coach bolts and tire bolts if American ones can be obtained, even at 10 per cent more money than the English, because he can pick up a Yankee bolt and apply it immediately to his work, and with its nice square out thread there is less chance of nuts becoming loose. What is the case with the English bolt? He will search a gross over and find every nut 'jammed' so hard on the bolt that it has to be taken to the vise and there oiled and eased. This takes time, and as time is money, he cannot be blamed for preferring the Yankee article. I shall not touch upon the American axe question more than to say that the loss of trade to England is through sending rubbish out at first, and not caring to be gulled by our own kith and kin, who ought to have known better, we went elsewhere for what we wanted 'and got it.'"

The above furnishes a most excellent business lesson. It shows the advantages of doing business "on the square." Just, honest and upright dealing is always the most profitable in the end. Whatever you do, do it well.

American mechanics, as a class, have no superiors anywhere, either as designers, creators or workers. They are also the most intelligent and ingenious. Common observation at home and abroad and the well-known workings of our common-school system furnish abundant proof of the former. The records of our patent office, which record more inventions annually than all the other patent offices in the world put together, give ample proof of the latter. If more is wanted, the telling fact may be stated that at the recent International Electric Exposition at Paris, five gold medals were awarded for the five greatest inventions or discoveries, and all five crossed the ocean to the United States!

Mr. Herbert Spencer, a man strongly wedded to his country, which has greatly honored him and which he in turn has greatly honored, says that the United States has the best mechanical appliances and turns out the best mechanics in the world.

With all these advantages, added to that of "square work," as shown in the above extract from a New Zealand letter, published in a leading English technical journal, is there any reason why we, as a nation, should not ultimately attain to supremacy in the world's industries? Are we not already fast approaching that point? Let us examine a few figures:

From 1870 to 1880 the manufactures of France increased by the valued amount of \$230,000,000; of Germany, \$430,000,000; of Great Britain, \$580,000,000; of the United States, \$1,030,000,000. In ten years we had increased the total value of our manufactures \$450,000,000 in excess of the increase in Great Britain, hitherto the imperial mistress of the industrial world! Is it any wonder that Mr. Gladstone's keen forecast should have led him, years ago, to prophesy that the United States "would eventually become the world's head servant in the world's great household"? Notwithstanding the progress we have already made, we are, in fact, but just beginning to develop our resources.

The Cleveland Plaindealer, in this regard, most eloquently and truthfully says: "We are just beginning to develop our resources while many of the nations find theirs well-nigh exhausted. Even now, the superior intelligence of our mechanics can compete against the cheaper labor of Europe. Even now, in spite of their cheap labor, we can lay down our steel in Sheffield, our certain lower grades of cotton in Manchester, our electroplate in Birmingham, our watches in Geneva, and undersell European manufacturers at their own doors. If this is the beginning, what, then, of the possible future? And then add to this how just now our markets are being rapidly extended under the impulse of electricity and steam as never before."

"We are next neighbor to all the nations; to South America, just quivering with its new life; to Japan and China, just waking up from the sleep of ages; to Africa, with its wonderful and mysterious future greatness. Within these 20 years it was as if the dead bones of the nations had been flying into place and a living soul had entered them. It is the dawning of Christian civilization for a billion of people who do not yet enjoy it. And Christian civilization means higher, nobler material, as well as intellectual and spiritual wants. After the missionary always goes commerce. Five hundred American steel plows went to the native negro Christians of Natal, South Africa, last year. All the millions of Asia and Africa are going to have their civilized cravings, as we do, some day. India, just beginning to be a little Christian, took \$12,000,000 worth of cotton goods last year. What may all Asia want 100 years

hence? What may Africa want 100 years hence? With those vast continents added to our market, and all our natural advantages realized, what is to prevent our country from becoming the mighty workshop of the world?

"Realize the resources of our agriculture, equal to feeding 1,000,000,000 souls! Fully develop our mining and manufacturing industries, which would be enough to sustain the whole billion, gain the pre-eminence in every market around the globe, and become the handmaid of the nations. Did not Mr. Matthew Arnold say aright in his lecture to us a year and a half ago, that 'America holds the future'?"

**KIMBERLEY GOLD FIELDS.**—A Brisbane special in the New Zealand Herald says: "An old miner named Webb, who has just returned to this city from Kimberley, gives a most disheartening account of the gold field. He says that when he left Wyndham there were 700 men there waiting to take return passage by steamer." A Cooktown letter of the same date is as follows: "The steamer *Catterthun*, from Foochow (August 22d), via Port Darwin (September 3d), which arrived here yesterday, brought nearly 200 diggers from Kimberley. Of this number, 40 are proceeding to Sydney. These men all give bad accounts of the gold fields." A letter from a storekeeper in East Kimberley to his brother in Sydney gives the following details of the rush to the mines: "The route from Cambridge gulf to the mines is 50 miles shorter than that from Derby, but it is not so good, being only traversable by packs, drays being useless on account of the hilly and rocky nature of the country. Thirty drays had to return lately, being unable to go by that route. Now, to give you an idea of the Derby route—men are starting off from here daily with wheelbarrows. The road is like a bowling green all the way. All the barrow wheels I had in store have been sold, and I now have a hundred weight of provisions for the diggings upon each. Just fancy an array of men with barrows starting for a journey of 350 miles! Twenty-six camels have just arrived, which we will utilize for taking supplies to the fields. I intend to form depots along the route at intervals of about 100 miles. \* \* \* The steamer *Triumph*, which arrived here yesterday, has brought 280 diggers and 170 horses, with the necessary equipments. The men, as usual, are of all kinds of trades and callings. There are at present 1000 men on the field, and 1000 more at Cambridge gulf and 800 at Derby ready to proceed there."

**THE LARGEST MANUFACTURING CONCERN IN THE WORLD.**—America can boast of having the largest manufacturing concern in the world. The *Bulletin* of the Iron and Steel Association has been "sizing up" the large iron-making concerns of the world, and comes to the following conclusion: "We often see items floating around the papers about the 'largest manufacturing concern' in the world. Various establishments in this country and abroad have been accorded that honor, but it now seems to belong to the Carnegie interests in and near Pittsburgh. In the month of March the Carnegie establishments made 38,698 gross tons of pig iron and worked it into finished forms themselves, their products ranging from steel rails to wire nails and exceeding in that month a total of 35,000 tons. If any manufacturing concern in the world can even approach this production we would be glad to hear of it. The Carnegies are to-day adding more largely to their works than ever before in their history. By this time next year they will have a capacity of 50,000 gross tons of pig iron a month. As late as 1865 the entire State of Pennsylvania did not make so much pig iron."

**DIFFERENT SORTS OF GOLD DUST.**—In the early days buyers and sellers did not for a long time recognize any difference in the value of different classes of gold dust. The first gold discovered by Marshall and his associates was sold for \$8 an ounce, but ere long rose to \$16, and remained at that figure for years. Then no more difference was recognized in gold dust than to-day in different sands. Buyers would mix their dust when sent to the Mint and were paid an average price for it, but they afterward learned that some dust was worth \$9 and other dust \$20 or more. The difference in value is now known to be due to the fact that a greater or less amount of the baser metals—silver, copper, etc.—is always found in alloy with gold in its native state. —*Wood River Times*.

**THE PELTON WHEEL.**—A large force of men are constantly employed at Geo. G. Allan's foundry, this city, in manufacturing Pelton hurdy-wheels, the demand for which is rapidly growing as the merits of the invention become more widely known. They are now in use not only throughout most parts of this country, but in many foreign lands as well, and everywhere they are giving the most perfect satisfaction. One was sent a few days ago to parties in London, England. —*Nevada Transcript*.

**NEW GLASS WORKS.**—The new works of the San Francisco and Pacific Glass Company, at the corner of Seventh and Townsend streets, are nearly finished. The proprietors expect to start up the furnace by the first of November, when they can turn out eight tons per day.

**TAHOE LUMBERING.**—Another steamer for logging purposes will be built this winter by the Tahoe Lumber Company.

### Progress in Iron and Steel Works in the United States.

The "Directory" of the American Iron and Steel Association for 1886, just published, furnishes some interesting facts in regard to the growth of this great leading industry during the last two years. We summarize as follows:

#### Standard Bessemer Steel Works.

In September, 1884, the country contained 20 standard Bessemer steel works, with 45 converters and one new plant in process of construction. In August of the present year the number had increased to 27 steel works and 58 converters. These figures indicate a great advance in this important industry for the short term of two years. The ingot capacity of these works had increased in even a larger ratio—from 2,490,000 tons to 4,102,000 tons. This increase is due more to improved practice and increased machinery in old works than to the increased number of works.

#### Clapp-Griffith Works.

The erection of the Clapp-Griffith works has also made remarkable progress during the same period, viz., from only one in September, 1884, to six in 1886, with two in process of construction. The capacity of these works increased from 5000 to 200,000! The Clapp-Griffith process is first cousin (so to speak) to the Bessemer process, and was quite fully described and illustrated in our last issue. Its advantages over the former are very important. These works require but a very small outlay, as compared with the standard Bessemer works, and are capable of being economically operated on a much smaller scale. The steel made by them is mostly used for nail plates, wire rods and the smaller classes of steel manufactures, although it is capable of being carried on upon the largest scale and its products applicable to anything for which the standard Bessemer steel is applied.

#### Open Hearth Steel Works.

Two years ago this month there were 35 completed open hearth steel works in the United States and three others in process of construction, embracing 63 furnaces. At the present time there are 42 completed works and seven in process of construction, embracing 91 furnaces. The ingot capacity of these works in 1884 was 550,000 tons, and in 1886, 660,000 tons. Open hearth steel works are manifesting more activity than at any previous time since the commencement of the present decade.

#### The Crucible Cast Steel Industry

Is now scarcely holding its own in the present struggle with the cheaper modern methods of steel-making. In fact, it appears to be slowly retrograding, as will be seen by the following figures: In September, 1884, there were but 41 works of this description, with 3594 steel-making pots having a capacity of 115,000 tons of ingots. In 1886 there were only 40 works, with 3391 pots of 110,000 tons capacity. Open hearth steel is the leading rival of crucible steel. Many of our crucible steel manufacturers are adding open hearth furnaces to their crucible plant. For locomotive boilers and fire-boxes, locomotive and car springs and agricultural machinery, the use of open hearth steel is rapidly growing; but for all the more delicate purposes for which crucible steel has heretofore been used, especially fine springs and fine tools either with or without cutting edges, it will always be in demand.

#### Rolling Mills.

The number of rolling mills in September, 1884, was 434, with 4 in process of construction; but in 1886 but 425 are reported, with 13 in process of construction. The slightly-decreased number of rolling mills, notwithstanding the increase of steel production plants, is accounted for partly by the fact that a number of rolling mills built to roll iron rails have been abandoned, in consequence of the increased demand for steel rails. The number of trains of rolls has also decreased from 1555 in September, 1884, to 1475 the present month of 1886. But the aggregate capacity of the rolling mills has slightly increased—7,600,000 tons in 1884 to 7,613,000 tons in 1886. The increased capacity of some of the rolling mills has more than made up the deficiency in the number of mills.

#### Nail Manufacture.

Statistics show a large increase in the number of establishments devoted to the manufacture of nails and spikes, from 1882 to 1884. But only a slight increase from 1884 to 1886 is now noted in the number of such works, from 81 to 83, but there has been in the same time a large increase in the number of nail machines. From 1882 to 1884 these machines increased from 5030 to 5695, and in 1886 there was an increase to 6355. Many of the new machines erected since 1884 were built to make steel nails.

The new dredger being built at the foot of Sixth street for the use of the United States Government in the Bay of San Pablo is nearing completion. This boat will be of the best description with all the latest improvements in the way of dredging machinery, etc. The hull is 130 feet long and beam 46 feet. Messrs. Hinckly, Spiers & Hays have the contract for the machinery, which includes engines, boilers and all the dredging apparatus. The boilers are of steel and are a fine specimen of San Francisco work in that line. All the machinery will be placed on board before the boat is launched.

### Yerba Santa.

Many of our readers will recognize in the engraving on this page a very good representation of a twig of the native plant, Yerba Santa, known to the botanist as *Eriodictyon glutinosum*. This plant is well distributed over considerable areas of the State, and its healing virtues widely lauded. Dr. Vasey, botanist of the U. S. Department of Agriculture, from whose report we reproduce our illustration, gives a description of the plant, which will be read with interest.

The Yerba Santa is a low shrubby plant of California, growing from 3 to 5 feet high. The stems and twigs are smoothish and generally showing more or less of a resinous exudation, particularly on the vigorously-growing twigs. The leaves are thick and rigid, alternate, lanceolate in form, usually 3 or 6 inches long, acutish at the point, and tapering at the base into a

### Tuolumne Marble.

In commenting on a recent article in the PRESS on California marble, the Tuolumne Independent says: The sidewalk in front of the Palace hotel, San Francisco, is Tuolumne marble, as also the Broderick monument in the cemetery in that city. Unfortunately we have no railroad so that we can compete with inferior marble from other localities, and the wagon freight is a tariff not to be overcome. Another fact is, that Tuolumne marble is so hard that manufacturers below will not use it when they can work up the soft cheese they import from Italy and the Eastern States. Customers do not know this or they would insist, even at increased cost, to have their monuments, etc., manufactured of Tuolumne marble. Stones in the Columbia cemeteries, set over 30 years ago, are as polished and perfect as when first cut. The same can be proved in San Francisco by

THE YERBA SANTA—A NATIVE CALIFORNIA SHRUB.

short petiole, the margins irregularly toothed, smoothish on the upper surface, the lower surface with a prominent fine reticulation, whitened between the veins by a fine and close, woolly pubescence. The flowers terminate the branches in a panicle, and are collected in numerous small, rather crowded, cymes or clusters. The individual flowers are about half an inch long, the calyx small and deeply divided into five sepals, the corolla of one piece (monopetalous) rather trumpet-shaped, with the border five-lobed, its color varying from purple to white. Attached to the inner side of the corolla near the base are the five stamens. There are three thread-like styles nearly as long as the corolla, and at the base a roundish, two-celled pod containing the seeds. The plant belongs to the order *Hydrophyllaceae*. The upper surface of the young leaves and twigs are covered with a resinous, balsamic exudation. The under surface presents a beautiful network of veins with a fine, whitish pubescence between them. The leaves have a balsamic taste, and have long had a local reputation among the old Spanish settlers in diseases affecting the mucous membranes, as in chronic coughs, catarrhs, consumption, etc.

the Broderick monument. The stone-cutters make more money by using soft stone, and care little for durability—and their patrons know no better.

A CABLE RAILROAD SUSPENDED.—The Telegraph Hill cable road is being taken up. It has been in operation for about two years and a half, but has not paid since the first three months of its existence. The road relied chiefly for patronage on the visitors to the resort on the crown of the hill. The directors of the company, seeing that the expenses were greater than the income, reduced the hours of running the line from 13 to 6 a day, about six months ago, thus cutting down the outlay from \$750 to \$400 a month. But even with this reduction the road still did not pay. It was finally decided to suspend the operation of the road entirely, and the cable and other machinery of the line are now being taken up. The cars of the road are to be stored in the Valencia-street carhouse. The track will be left where it is. It was said yesterday that the traffic on the road might be resumed at some future day.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PRESERVING PILES.—James Cass, Cayucos Landing, San Luis Obispo Co. No. 349,853. Dated Sept. 28, 1886. This is a novel means of preserving piles and other submerged wooden structures from the ravages of marine worms and insects. The process consists essentially in coating the pile or timber (after the bark has been removed) with a compound; next surrounding said compound with a covering of ship-felt, then nailing longitudinal battens on the timber outside the felt, and finally securing the battens by hoops or holding-bands.

ANTI-FRICTION THILL-TIP.—R. W. Simpson, S. F. No. 349,817. Dated Sept. 28, 1886. A tubular tip or ferrule, preferably of metal, has on its under surface, near its outer end, a roller which is mounted on a journal or pivot which can be readily oiled and cleaned if necessary. These tips are secured on the ends of the shafts or thills in any suitable way. The rear ends of the tips are formed with circumferential grooves to provide for the attachment of the usual leather sheaths. The shafts, when not in use, rest on the rollers or the tips, and there will therefore be no wear upon them to sharpen them down.

MOLDING MACHINE.—Richard Savage, S. F. No. 349,815. Dated Sept. 28, 1886. This apparatus is for making molds for castings. It consists in a directing chute having front and rear walls, into which the sand is received from above; a joint or joints at some portion of the length of the chute, so that it may be deflected to direct the sand into different parts of the flask beneath; a means for supplying sand to the hopper, and regulating gates by which the supply may be cut off from any one or more of the sections. The sand is kept in a compact body by this chute, and is not scattered by the resistance of the air; moreover, the chute may be moved from one side to the other over the flask or mold below, and may incline to either side of the perpendicular, as the sand is guided by either side of the chute. There are certain other improved details in the apparatus.

MOVABLE ICE-CHAMBER.—Ignazio Allegretti, West Berkeley. No. 349,831. Dated Sept. 28, 1886. The invention relates to the class of compartments or chambers which are adapted to contain ice or other cooling substances, for the purpose of keeping cool the temperature of a room or other compartment, and which are specially adapted for use in fruit cars. It consists of an ice-chamber of peculiar construction, whereby it may be readily handled or moved about and used in various places, said box being sectional and readily divided into its several parts for transportation when not in use, and easily set up again. In connection with this box or chamber the invention further consists in a novel skeleton frame or casing, adapted to contain the box and to be readily and effectively secured to the apartment in which it is used, and removed when not in use, said casing and ice chamber being located in such manner as to afford access from without.

LABOR-SAVING MACHINES.—What would be the condition of this country without its labor-saving machinery and processes? To more clearly understand and better appreciate the advantages afforded, we direct the reader's attention to the fact that to perform the work accomplished by power and power machinery, in our mechanical industries and upon our railroads, would require about 35,000,000 men, but which is now done with the aid of only 4,000,000 persons! Look what an enormous loss this would be, economically and commercially. This encouraging condition of industrial affairs is of course largely attributed to the ingenuity of our inventors, who quickly recognize the needs and supply improvements. Nor is it likely the time will ever come when invention will have naturally outworked its mission, for it is now in a more prosperous condition than ever, and many improvements of unusual importance are continually produced.

MINING SUIT.—The heirs of John B. Gray have filed notice of a suit pending in the United States Circuit Court against the Quicksilver Mining Company, whose mine is at New Almaden. The averments declare that the object of the action is to obtain a decree adjudging that the complainants are lawful owners of three-eighths of all the mines, minerals and ores on the land and premises of the defendant, and that the defendant holds this three-eighths in trust for the complainants, and it is asked that the defendant be required to account to complainants for all the money realized by it or its predecessors in interest in the Quicksilver Mining Company, of Pennsylvania, from this three-eighths, and that general and equitable relief be granted. It further recites that the premises affected by this action are the Rancho de los Capitancillos, in Santa Clara county.

A LARGE LEDGE of coal has been discovered on the land of E. P. Fellows, on Stevens creek, Santa Clara Co., averaging six feet wide. Croppings, it is said, have been traced for more than a mile. The surface specimens are of an inferior quality.

## TABLE OF CONTENTS.

EDITORIALS.—Sluices, 245. Passing Events; Unsuccessful Deep Mining; Gold Dredging in Rivers; The Iron Trades; Miners' Valuation of Mines, 248. Dredging Machinery; Prices of Claims, 249.

ILLUSTRATIONS.—Sluice for Gravel Mining, 245. The Yerba Santa—A Native California Shrub, 247. Dredging Machinery, 249.

MISCELLANEOUS.—Wood River; Arbitration; American Industries—Their Future, 246. Progress in Iron and Steel Works in the United States; Yerba Santa; Tuolumne Marble; Notices of Recent Patents, 247.

MECHANICAL PROGRESS.—Aid and Encouragement which Inventors Need; Illustrating Machinery; Interesting Experiment in Casting Steel; Heat-Indicating Paint; Wire Nails vs. Cut Nails, 250. SCIENTIFIC PROGRESS.—Coloring Matter from Cotton-Seed Oil; Oil From Corn; A New Glass for the Microscope; How Incandescence is Produced, 250.

ENGINEERING NOTES.—A Gigantic Feat; New Water Ways for Russia; Electrical Navigation; An Endless Railway; From New York to Boston, 251.

USEFUL INFORMATION.—The Magney Plant; Cheapening Embroideries; A New Joint Material; To Clean Glass and Silverware; Flexible Glass; "Naught" and "Nothing"; Iron Rust in Dry Goods; The Animal Life Cost of our Ivory, 251.

GOOD HEALTH.—A Word of Caution to Woolen Mill Operatives; Boys and Cigarettes; Tetanus Treated by Rest; The Throat, 251.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 252-53.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 256.

## Passing Events.

The proposed cessation of deep mining on the Comstock will result in the discharge of many miners and be a serious set-back to Virginia City. The effect on the stock market here will probably be disastrous, as without the possibilities of bonanzas in the lower levels, transactions in mining stocks will amount to little.

The starting up of the Holcomb valley gold mines in this State, after years of abandonment, is but another indication of the increase of interest in quartz mining in California.

The new magnesite mine at Livermore, Alameda county, now being worked, adds another product to our mineral yield.

Explorations for oil and natural gas are going on all over the State, and in several places success has been met with of late.

A number of good mining strikes are reported this week from different parts of the coast, the details of which will be found in our mining summary on another page.

A MINE-OWNER near Sheridan, M. T., reports the discovery of a new metal. It carries considerable gold in places, but the latter cannot be separated from the strange material by any process of working gold ores. The mineral when melted is as white as silver, but much harder.

PREPARATIONS will soon be made for the resumption of work at Bullionville. A new process for the working of the rebellious tailings will be tried and it is hoped will prove successful.

THE Paradise valley mine was the only mine in Nevada that paid a dividend last month, and the amount was only \$20,000.

THE Iron Hill mine of Dakota is doing well, having produced 275,000 ounces silver to date.

## Gold Dredging in Rivers.

We have before stated in these columns that all attempts to mine in river-beds in California by means of dredging appliances have been failures, though many trials with various devices have been made. The English appear to have made a success of the system, however, especially in New Zealand, where river dredging has been carried on for 16 or 18 years on the river Molyneux (or Elutha), in the Provincial district of Otago. A correspondent writes us that the dredges are built, as a rule, in the city of Dunedin (the chief city of the district), but some of them are also built on the banks of the river. So successful is the dredging proving that three or four new dredges were built last year and put to work on the river.

The Molyneux is a very rapid-flowing river, taking its origin from three lakes, separated by a large tract of country—the Wakatipu, Hawea and the Wanaka. The former is 70 miles long by 2 to 10 broad, and has never been bottomed. The other lakes are not so large, and are connected. They are all three snow-fed, and the two rivers join at about 30 and 40 miles from the respective lakes and travel mostly through steep, rocky gorges another 120 or 130 miles to the seaboard.

A large amount of alluvial gold has been taken from the whole of the districts, and some rich quartz ledges have been partly developed, but have, in many cases, been abandoned in consequence of the want of the best modern machinery. Business might be done by some of our manufacturers here if endeavors were made to introduce some of our best and most recent quartz-crushing machinery. A number of American business firms have been established in Dunedin for many years. Since the discovery of gold in New Zealand (1861) the mines have yielded no less than \$240,000,000—a very handsome return from a country with only half a million inhabitants.

## The Iron Trades.

Business with the iron trades in this city has continued dull for a long time, the absence of large contracts having been greatly felt by the foundrymen and machinists. The increase of prices in the East and the enlargement of business has not been felt here as yet, though the signs of its approach are apparent in a much more hopeful feeling than has prevailed for a long time past. It usually takes some months for a revival of business East, to influence matters here. Though there is an abundance of money here it is not circulating as rapidly as those without it could desire. Still, should a revival of business occur, as appears likely, this money will seek new enterprises and enlarge old ones.

While business has been dull here there has been much competition, and work has been accepted at prices that paid no profit. This has been done to retain men employed and keep large works running, a fact that mechanics and laboring men do not always appreciate. The superintendent of one of the largest establishments in this city told the writer recently that he had several hundred men at work to no profit to the company, but with prices a little better he could work 200 more.

Though the foundries and machine shops report no special improvement in their lines, they are more encouraged than for some time past. The increase in quartz-mining operations in this State ought to benefit them eventually; and the gradual but rapid settlement of much vacant land in California is bringing new customers also. The Southern Pacific Company's rolling mills, in Sacramento, are now manufacturing 30 tons of iron every day, in all shapes, for railroad work. The roads now being built are causing a great demand for it. If one of our large foundries succeeds in getting a contract for one of the new cruisers the Government is about to build, it will be a great step in advance for our home industries, and there is a possibility of this being done.

JOHN COYLE writes to the Grant's Pass Courier from Galesville that in one blast in their ledge they broke and threw out upward of \$7000. He said that some of the ribbon rock from one to four inches was almost solid gold.

THE old Raymond & Ely mine, at Pioche, has been started up after a shut-down of several years.

## Unsuccessful Deep Mining.

The topic of interest among mining men at present is the proposition to cease prospecting on the lower levels of the Comstock lode, which is now under consideration. The pumping at the Combination shaft has been done by the Chollar, Hale and Norcross and Savage Companies, but the Savage Company has refused to pay its quota any longer. This action by no means involves the abandonment of the lode, but simply the lowest levels, which will be allowed to fill with water should no arrangement to continue work be made. Mr. W. S. Hobart, the well-known mine-owner, has stated that he did not think the shaft would be shut down at present to the 2400-foot level, but that the bottom of the shaft would be abandoned by stopping the pumps at the 3000-foot level immediately. After a little while, he thought, the next set of pumps at the 2600-foot level would be stopped, and eventually, in all probability, the shaft would be stripped to the 2400-foot level. When asked what he thought would be the effect of abandoning the lower levels in that way, Mr. Hobart said he was afraid it would have a very bad effect on mining in the Comstock. It would, he said, put a stop to the collecting of assessments, as he feared it would put a stop to all speculation in Comstock shares. The public, he said, have hoped for and have been educated to look for very large developments below the 3000 level. There is, he said, a great deal of unexplored ground in the upper levels, but no one looks for any great developments there.

The immediate cause of the shutting down was the refusal of the Savage people to bear their proportion of the cost of keeping the pumps going. This threw all the burden of the expense on the other two mines, and they did not care to carry it.

There was, he said, at one time a project for driving a long drift through the lower levels to drain the middle mines through those at the south end, and maps and plans of the proposed work were made; but the scheme fell through because no arrangements could be made which would be satisfactory to all the parties to be benefited by the drainage.

As to the statement that the pumps at the Yellow Jacket new shaft would probably be started up for the purpose of draining, so as to prospect the 2700 level of the Belcher mine, Mr. Hobart said he knew nothing, although he did not consider it improbable, as he had always been given to understand that the showings were very good in that mine when it was shut down.

Among other things it is now rumored that an attempt will be made to get Congressional aid to work a shaft to the 5000-foot level.

A curious feature of the proposed cessation of pumping is the fact that W. S. Hobart, one of the Chollar trustees, is also a large shareholder in the Virginia and Gold Hill Water Company. The shutting down of the hydraulic pumps at the Combination shaft will curtail the monthly revenue of the latter incorporation \$10,000. To offset this the rumor is revived that the pressure heretofore required to operate the hydraulics will be utilized to drive stamp mills to be erected in the canyon east of the Chollar old works for crushing ore from the mine, the extraction of which it is alleged will be resumed on an extensive scale. Repairs to the old hoisting works now in progress lends a shadow of plausibility to the rumor.

BANK OF CALIFORNIA.—At the annual meeting of the Bank of California this week it was reported that the aggregate movement of the bank for the year was \$598,319,559, equal to an average monthly movement of \$49,859,963. The amount of exchange reported was \$45,109,049, and the amount of bullion received \$7,701,800. The gross and net earnings for the year were as follows: Interest, \$462,705.41; other sources, \$80,359.85; gross earnings, \$543,065.26; expenses, \$136,438.86; net earnings, \$406,626.40. From the net earnings four quarterly dividends of \$75,000 were paid and \$55,085 was added to profit and loss account. The increase in business for the past year is in round numbers \$1,250,000. The real estate owned by the bank outside of the bank premises is put down at \$441,562, but is valued by experts at \$1,000,000.

A MILL is to be put up at Wright's Creek on the ridge north of Ashland, Oregon.

## Miners' Valuation of Mines.

By reason of the depression that exists in the agricultural, manufacturing and most of the other leading industries of the world, there is being manifested a more general desire than ever before to embark capital in the business of mining for the precious metals. This disposition is apparent on every hand. The English have of late been putting a great deal of money into the mines of India, Australia, Africa, Mexico, and of South and Central America, their investments in our own Western States and Territories having, meantime, been less than formerly. Why these British investors should have ventured their means in these other foreign and even more distant countries rather than in the great metalliferous fields of the United States is not at first glance apparent.

It becomes pertinent, then, to inquire why it is that these people go looking after mines in the jungles of far-off India, on the hot and malarious coast of Africa, and in the still more deadly districts of South America, into which every pound of machinery and most other supplies have to be imported, instead of coming to a region noted for the excellence of its climate, possessing every facility for the manufacture of machinery, and equally as rich in its mineral resources as these pestilential and savage lands. The reason we conceive to be this: In these other countries it is possible to secure a large extent of mineral-bearing territory at comparatively small cost.

These regions, though remote and, for the most part, hot and unhealthy, are sparsely populated, and that by a semi-barbarous and lethargic race, who either lay no claim to the mines, or, if they do, set little value upon them—knowing that if they retain their ownership they will not themselves ever derive much benefit from them. And so the English and other Europeans, with their superior energy and intelligence, their more ample means and better acquaintance with the business of mining, arriving in these countries find no difficulty in getting hold of all the mineral deposits they want—buying them for a trifle where they acquire them by purchase, or taking possession of them without this formality, as they very often do. Whichever course is pursued, there is apt to be little or no trouble about title—there being, at the same time, no occasion for middle-men, nor for the expenditure of much money at the start. If these mines are a long way off and in a country with which it is difficult to communicate, these are not, by the speculator and promoter at home, looked upon as insuperable obstacles, and may, even by this class, be considered an advantage—as affording means for preventing shareholders from becoming too familiar with what is going on abroad.

Turning now to California and the Pacific Coast, how different the conditions. The agent of Eastern capitalists or of a foreign syndicate coming here finds everything in the shape of a mineral deposit taken up and claimed. Every outcropping of quartz has been located, notices, during periods of excitement, having very often been placed on detached boulders, showing that they also had been reduced to ownership. Even promising "float" has sometimes been honored in the same way. In hardly more than one case out of ten have these locations been proved, upon only a few of them has anything determinate been done, nor do they, either through exploratory work or natural exposure, give positive evidence of a large or even a moderate wealth. That many of them will develop into paying mines is probable enough, but to accomplish this will take time and money, and in most cases a good deal of both. So far they are mere prospects; and yet let a stranger, or, for that matter, any old stager, approach one of these claim-holders with a view to buying his proprietary interest in these shadowy properties, and what is the result? Are they offered to him on anything like reasonable terms, or at a moderate figure? Hardly ever; a price is almost always asked for them that confounds the would-be buyer at the outset. Our claim-holder is a man of large ideas—hopeful and sanguine, yet hard and exacting withal. His talk is of thousands and tens of thousands, and he feels like chiding himself if he restrains it from running into the millions. His claim, he assures you, contains a veritable bonanza. The story of Monte Cristo seems tame compared with what he tells

you. The wealth of an Astor is poverty beside the treasures that lie buried right under your feet. The vaults of the Bank of England would be insufficient to hold them; he contemplates their enlargement. And so, adhering to these excessive prices and pursuing this extravagant style of speech, this class of claim-holders soon succeed in convincing buyers and promoters that it is useless to attempt negotiating with them for mining properties; hence the little that for some time past has been effected in this direction either here or elsewhere on the Pacific Coast, and if our miners expect to market their grounds or to get money to help open them up they will have to change their policy as above outlined. Many of these mountain men seem unconscious of the changes that in this regard have taken place during the past six or eight years, going on in the expectation that mere indications and partially-developed mines can be disposed of just as in the days of reckless investment and wild speculation, when these properties were bought for stock-jobbing purposes. They ought to know by this time that a halt has been called all along the line, capitalists being no longer willing to take all the chances—paying big money for mere possibilities.

Already the mining countries lying along and to the west of the Rocky mountains, California included, have been greatly retarded owing to the causes here indicated, and this notwithstanding their great store of mineral wealth and other natural advantages. Even moneyed men in the Eastern States, tiring of their unavailing efforts to get hold of mines and mining properties in these west-lying regions on suitable terms, are beginning to look south for better opportunities than offer here, Mexico, Central America and the United States of Colombia being the fields most attracting attention off that way. We are advised of several schemes that have recently been set on foot in New York and other cities on the Atlantic seaboard for operating on a large scale in one or more of these countries, some of these being directed to vein and others in hydraulic mining.

It is well understood that the mines there are no better, if as good, as we have in this country, and that they must be worked under many disadvantages. But these latter are supposed to be more than offset by the cheap labor obtainable and the little expense with which large mining properties can there be procured, the cost of these items being as three to one in favor of these foreign countries. The vender of mines, when reminded how often these mining ventures turn out badly, is apt to reply that this want of success is due to bad management, to a faulty choice of machinery or of processes for working the ores, or to other mistakes. Admitting such to be the case, this amount of failure may very properly be taken into the account by the investor when buying a mine, since it seems to be incident to the business. This is the rule adopted in all pursuits. The average of loss must be charged to the business as a whole. If the locator of a claim keeps and attempts to open and work it, he may himself commit these same mistakes and come out loser in the end. It is not our purpose to especially condemn the course pursued by this well-deserving class of men, nor yet to discourage them from exacting for their claims all they are worth, and all, in fact, that they can fairly get. Yet it would be well for them to remember how conditions have changed, how great have been the losses sustained by investors in mines, how seldom these properties turn out as expected, and how generally it has happened that the locator who sold when he had an opportunity has had reason to felicitate himself on having done so.

H. D.

### Dovetailing Machinery.

Machinery for cutting dovetails must of necessity be of a very ingenious nature, and when this is so arranged as to cut at any desired angle or size, it becomes most useful in the wood-making trades. The engraving on this page shows improved patent steam and hand dovetail machines which fulfill these requirements.

In the engraving, Fig. 1 represents a machine for cutting dovetails, invented by L. P. Garcin. The cutter is a circular saw mounted upon an ordinary arbor, whose bearings are upon a rocking iron frame, and the trunions of which are considerably above the plane of the saw arbor. The frame is caused to oscillate or recip-

rocate on these trunions by means of a connecting rod and eccentric, the stroke of which may be changed so as to make a narrow or wide dovetail. By lowering or raising the bearings of the saw, and the further lowering or raising

attachment for the exclusion of dust and wind on the edges of window-sashes and doors, as shown in Fig. 2. This cut illustrates the position of the rubber tube as inlaid on window sashes. It consists of a dovetail groove cut on

FIG. 1. Round-Bottom Dovetailing Machine.

FIG. 2. Application to Window-Sash.

FIG. 3. Straight-Bottom Dovetailing Machine.

FIG. 4. Dovetail Tenon-Cutting Machine.

### IMPROVED PATENT STEAM AND HAND DOVETAIL MACHINES.

of the table, the depth of the dovetail is varied. Several applications of the saw are made; by disconnecting the rod a cut may be made square, or at any angle to the table.

One of the applications of the groove cut by this machine is the insertion of the rubber-tube

the lower sash, and on the meeting rail of the upper one. Its adjustment on doors is equally simple. The rubber tube protrudes from the edges, so that the hermetic joint is effected by means of the compression which is obtained, on doors by simply closing them, and on windows

by means of the fastener shown in Fig. 5. Fig. 3 shows an adjustable straight-bottom, dovetail-cutting machine, by the same inventor. This machine is supplied with two saws, one in the rear of the other, and set at opposite angles. The arbors being mounted on a frame which rests on slides, a reciprocating motion is given to the frame by a device similar to that described in Fig. 1. By this motion each saw cuts one-half of the dovetail through a number of pieces, which are secured to an automatic feeding apparatus. The most important of the advantages of this machine is that it is provided with mechanism necessary to vary the size and distance apart of the dovetails.

Fig. 4 shows a dovetail tenon cutting machine devised by the same inventor. The dovetail tenon to suit the above machine is produced by revolving knives set on a horizontal square arbor whose bearings run in slides on the frame of the machine so as to allow, by means of a lever, the lowering of the knives through the pieces to be tenoned and their being raised back to their original positions. The work to be tenoned is fastened to the table beneath, entirely independent of the knives. This is inclined alternately to the required angle, first right and then left; the knives cut one side of the tenon at each of the two angles presented so that they are passed through the work twice to make the tenons. The machines are constructed to receive pieces from one foot to two feet wide, the ends of which are completely tenoned at two cuttings.

The size of the tenons are varied by changing the inclination of the table and their length by a gauge against which the pieces are set. The distance between the tenons is adjusted by changing the knives. Ciprico & Marais, manufacturers' agents, 104 Market street, are the agents for the above machines.

### Prices for Claims.

There is scarcely a more difficult thing to do than to put an exact valuation on a mining claim—one that will be fair to both owner and purchaser. The purchaser is apt to depreciate and the owner appreciate the property. It is different from ordinary commercial transactions. In purchasing an article of commerce there is a certain value at the time, which may be higher or lower afterward, but when bought is governed in valuation by other articles of the same character. But a mining claim may be worth millions or nothing when purchased. If the exact contents could be determined, a price could be set, but this is impossible. No one claim is exactly like another.

The miner has to search the mountains and find his claim; then he has to open it to some extent, and then he wants to sell. It is a characteristic of this class to be hopeful and sanguine. Small wonder, then, if they ask more money for their "prospects" than they are really worth. To them it represents so much time, labor and skill, and they think the capitalist who wants to buy should pay a good price for what to them seems of great value.

"H. D.," in an article on "Miners' Valuation of Claims," in this number of the PRESS, holds that because miners ask high prices, capitalists are being driven away from our border to other countries to buy mines. There are probably cases of the kind, but there are also hundreds of cases which might be cited where capitalists have got hold of good, rich mines, for a mere trifle compared to the ultimate yield. Miners remember these things, of course, and try to get the best prices they can for their properties.

There are hundreds of men in this State who have been made rich from mines that other people found, and which they bought. Of course if a man pays \$30,000 or \$40,000 for a mere prospect hole he lacks judgment, but one can scarcely blame the miner for getting all he can for his mine. There is a middle course in all such transactions for both owner and miner. But because a few foolish men charge exorbitant prices, it by no means follows that they can get them or that it prevents people generally from investing in mines. There are plenty of good prospects and mines in California today which may be purchased at reasonable prices.

The foreman of a mine at Indio, on the Colorado desert, was recently escorted to the railroad by the miners and told to leave that section of the country.

## MECHANICAL PROGRESS.

## Aid and Encouragement which Inventors Need.

O. Chanute, Esq., of Kansas City, gave some valuable hints on the progress of mechanical science in an address delivered before the American Association at its recent session in Buffalo. In regard to the true objects of the section of mechanical science, and the means of increasing its usefulness in the future, he said that, in marked contrast with the past, the present age is one of pronounced material development. Formerly the brightest and most gifted men devoted themselves to religion, philosophy, politics, exploration, art; but for the past hundred years the attention of leading men of the civilized world has been directed to increasing and cheapening those products which minister to the daily life and comfort of man. Farmers, mechanics and laborers live now more comfortably than did the middle classes of feudal times; the duration of human life has been materially lengthened, and all portions of society recognize the importance of further progress, and the advantage of organization and invention in securing it.

This era of material progress may be said to have commenced with the final perfecting of the steam engine, which, together with the various attendant machines, takes the place of hand and animal labor, which has increased and cheapened the production of the necessities and luxuries of life; and it has pushed the inventor and the engineer to the front rank in modern society. It may be useful to point out the absolute necessity of verbal and written intercourse between investigators and inventors, that the speculation and curiosity of the former may ripen into the effective invention of the latter. Nothing is more remarkable than the multitude of minds and facts which are required for the perfecting of even a simple machine, nor how little the last man may need to add to complete the invention. Facts and natural laws, known for years as curiosities, are taken up by some inventor, who fails in the attempt to render them of practical use; then a second genius lays hold, and, profiting by the mistakes of the first, produces, at great cost, a working machine. Then comes the successful man, who works out the final practical design, and, whether making or losing a fortune, he yet permanently benefits mankind.

The faculties of invention and discovery are generally separate. One set of men observe facts and deduce laws therefrom, and another set endeavor to turn the results of this observation and deduction to practical account in the production of labor-saving appliances. This section should be the place where these men may meet one another and profit by the interchange of ideas.

Ordinary technical societies usually discourage speculative papers and discussions, and prefer to hear of accomplished facts; but the busy men who are developing this country need something more—they need to keep up with discovery before it is reduced to practical account, and they need that personal contact and sympathy with men of science which nothing can replace. Engineers, as well as other practical men, owe it to themselves to come to these meetings, bringing accounts of what they have done and *hope to do*, and especially what they have *failed* to do, and why; and some speculative papers may well be allowed providing always that they are on a sound basis and tick to facts, for how often is it that the imagined things of to-day become the accomplished results of to-morrow!

## Illustrating Machinery.

The importance of using illustrations that will convey a correct idea to the mind of the construction of the machine or machinery is often overlooked. Some have thought that anything that in part represents the construction is sufficient; that parties interested will write making inquiry and then there will be an opportunity to present the facts. But this is an unwise conclusion, for the reason that our first impressions of mind about anything are difficult to change. A new machine is advertised; we are interested in such machinery, and examine it as far as we can from the illustration, and largely make up our mind as to its merits or demerits. If our impressions are unfavorable, we most likely never look after it further, unless something comes in our way to attract our further attention. Our unfavorable impression may be in part the result of a poor illustration; it may be rough, crude, dim or blotched, so as to be repulsive to us; otherwise, if the cut illustrating it had been well executed, we would have formed a very different impression, and possibly we might have become a purchaser of the machine. Those having any line of goods to sell will do well to spare no expense in having the very best work done in the engraving of their illustrations.

A woodcut engraving (well done) is best, showing a finished machine ready for the market. These woodcuts should be engraved from photographs of the machine. Photos may be photographed upon the wood direct the size desired and the engraving done from the latter. There is a wide difference in the skill of engravers; one is able to bring out every line and shade so distinctly that any one examining the illustration can almost see it in operation; another makes an indistinct illustration—one that might in some way serve to remind us of the machine if we had before seen it. The latter cut probably costs less money, but it makes fewer sales.

A woodcut should not be used to print with, if it is intended to preserve it for future use; but electrotypes should be taken from the wood engraving, and the woodcut preserved for other electrotypes to be taken from if they are needed using the electrotypes to print from only.

We have been thus particular for the reason that many persons are not familiar with the methods of obtaining cuts to illustrate with. We very frequently have inquiries to answer, and not infrequently the charges for engraving the woodcut are thought to be high and the electrotypes very cheap, whereas all the labor is expended upon the engraving. A rough sketch engraving can be done for half the cost of a fine engraving. The latter, however, is the cheapest in the end.—*The Clay Worker*.

## Interesting Experiment in Casting Steel.

In a recent discussion before the British Iron and Steel Institute, Sir Henry Bessemer gave some interesting particulars of an experiment he made 30 years ago, suggested by observing the difference between French and English lump sugar. The English sugar has a much larger crystal than the sugar made in France, and in the latter the material is cooled quickly and stirred while cooling, while English sugar is allowed to stand and crystallize slowly. Some kinds of sugar candy stand for days while in the process of crystallization, the operation being retarded by heat. In that case the crystals are very bold and pronounced.

It is also known that in heavy iron castings, where the heat is kept in a long time by the mass, large crystals are apt to be formed. The experiment above referred to was made in the following manner:

A hole was made in the earth and lined with sand; into this a mold, which would produce a spherical casting, was placed. Between the mold and the sand a quantity of charcoal was packed. The mold then had a quantity of malleable iron made on the Bessemer process poured into it, and the whole was covered up for 10 days. The metal had a heavy dose of phosphorus— $\frac{1}{2}$  to  $\frac{3}{4}$  per cent—but no carbon. At the end of the 10 days the globular mass was dug out. A smart tap with a two-pound hammer had the effect of sending off a shower of crystals, and there appeared to be no cohesion among the particles of the mass. On hammering one of the crystals on an anvil, it could be flattened down, thus showing that each individual crystal was a particle of malleable iron, although the cohesion of the crystals to each other was so slight. Sir Henry thought this experiment worth detailing, as it tended to show the great importance of the time allowed for cooling in iron and steel.

**HEAT-INDICATING PAINT.**—A few years since we noticed in *Iron* a paint for indicating, by change of color, a rise in temperature in objects painted with it. History repeats itself, and to-day finds another pigment, having the same object, introduced by Mr. Henry Crookes, of 4 Westminster Chambers, Victory street, London. We have tried a sample of this paint, which is of a brilliant red color and has the property of gradually becoming darker when heated, until, at about 160° Fahr., it attains a very dark brown color, and when allowed to cool for a few minutes it regains its original red. It is stated that this change of color is not affected by age or use, the paint being as good after 100 changes backward and forward as it was when freshly made. This property of indicating a rise of temperature in such a striking manner would appear to render this paint very valuable to engineers; for, if applied to the bearings of any machine or engine, it should act as a tell-tale of the temperature. As long as the paint remained red, the man in charge would know that the bearings were all right, without having constantly to go round and try them with his hand; while a change of color would warn him that the bearing was getting hot and required attention.

**WIRE NAILS VS. CUT NAILS.**—The impression generally prevails that the cost of manufacturing wire nails is greater than that of cut nails. A cotemporary thinks that a visit to a first-class wire-nail mill would readily enlighten the cut-nail adherent as to the possibilities of wire-nail manufacture. "With an output averaging 80,000 pounds of No. 5 rods per day, with but two furnaces and about a dozen men and boys, wire rods can be made cheaper than nail plate. Between the wire nail and the cut nail, so far as quantity is concerned, there can be no comparison. It is singular that there has been so little improvement in the cut nail. The change from iron to steel is a step in the right direction, but a change in the form of the nail is imperative. The bluntness of the cut nail is its chief defect, and it is a weighty one. The blunt nail destroys the fiber of the wood through which it is driven; in fact it usually punches a rough hole through it, thus materially lessening the holding power, and by leaving an open space around it, moisture enters and hastens the destruction of the nail by rust. But in all probability, in the near future the improvement of the cut nail will be compulsory, if it is to hold its place against the encroachments of the wire nail."

## SCIENTIFIC PROGRESS.

## Coloring Matter from Cotton-Seed Oil.

The uses of cotton-seed oil are leading to a rapidly-increasing industry. The total manufacture of this article in the United States has already reached to nearly 3,000,000 tons annually, of which about 300,000 are annually exported to Great Britain, and perhaps as much more to other countries. This oil has been applied to a great number of uses in the industrial art, and is constantly finding new sources of appliance. The latest and perhaps the most interesting application is to the dyeing industry, where it bids fair to find a large and most valuable use for mixing with the aniline dyes.

Crude cotton-seed oil is of an intense ruby—nearly black color, due to its holding in solution a powerful vegetable coloring principle, by which peculiarity it is most decidedly distinguished from all other oils. The oil-cells appear in the seed as brown specks dispersed through the albuminous matter. Hitherto the oil has been practically useless for many commercial purposes, for the reason that it communicated an ineffaceable stain, due to this active and persistent coloring principle.

By a recently-discovered method of refining the oil, this coloring matter is readily isolated, thus giving additional value to the oil, and also furnishing a most valuable addition to the list of dyestuffs. In its dry state, this coloring matter is a light powder, of pungent odor, of a brown, earthy color, and possessing powerful coloring properties. A small proportion is soluble in water; but the principal bulk dissolves only in alcohol or alkalies. It is quite insoluble in all acids.

With the whole range of aniline colors, the cotton-seed coloring matter seems to possess the property of forming definite chemical compounds, the nature of which is not yet fully investigated. It acquires the color of the aniline used and only a small proportion of the latter is necessary; in this way an infinite variety of brilliant dyes of perfect fastness may be obtained.

The above facts were first made public in a paper read before the Liverpool section of the English Society of Chemical Research in March last. Samples of cloth dyed by this material were exhibited, ranging in color from a light straw to a rich dark-brown. The entire paper, as read, is published in the *Paint and Drug Reporter*, which journal, in criticising the same, remarks that "there is a desire to learn some of the experimental foundations for the statement that the coloring matter formed chemical compounds with nearly all aniline dyes. If the nature of these compounds were known, the chemical nature of the coloring matter would manifest itself. It is yet questionable whether the real dyestuff can be isolated and whether it is capable of industrial application, the instances given being only experimental. Persons who attach any importance to this feature of the cotton-seed oil industry can satisfy themselves on this point by extracting the coloring matter from soap stock which is almost given away. Soap stock contains most of the dyestuff."

Considerable time has evidently been occupied in the investigation, but it is thought by some that much labor could have been saved if the experiments had been conducted in a more systematic and philosophical manner. English criticism of the paper has been anything but favorable. As a member of the Chemical Society remarked, "The age of random experiment was now past, and practice must be guided by theoretical knowledge in order to attain success." However, the author has opened the way for further investigation and has suggested a means of developing the dyestuff feature of trade, which should, and no doubt will, receive proper attention.

## Oil From Corn.

Chemical research is ever busy in looking for things new and useful from sources in which they have been hitherto hidden. In these two adjoining columns, which are always devoted to scientific progress, we this week note three important chemical discoveries, each of which promises to exert a marked influence upon industry and further research.

This present writing is to make a brief reference to the fact that a new source of oil has been discovered. Oil is now being extracted from corn at St. Louis, a bushel of corn yielding about half a grain of oil as a by-product in the process of distilling for alcohol, or in that of manipulation for glucose or starch. The oil is taken from the germ of the kernel, and in both instances, while furnishing a useful and important article of commerce, its isolation is of a decided advantage to the production of either alcohol, glucose or starch.

Experiments were made, some years ago, to obtain other than fusel oil from corn, but with trifling success. The attempt, however, was not forsaken, as recent results have demonstrated. Chemical researches have brought about a process in the manipulation of corn for its various products, which extracts, as a by-product, a clear, sweet, amber oil, suitable for culinary as well as for various other purposes. The true worth of this new oil has not yet been fully placed before the public; but if its manufacture, which has already been commenced on a large scale, is continued, as it doubtless will be, it will no doubt be found applicable to a

great variety of uses. Being a by-product, its manufacturers will be able to place it on the market at a lower figure than competing oils. If the various distilleries throughout the country possessed the improved process of extraction, the production of corn oil would be extensive; but we understand that the secret is in few hands, with the probability of remaining so for some time at least. The progress made thus far prompts the question, If corn produces a commercial oil other than fusel oil, why should not other cereals do the same by a similar process? It is said, also, that the cake is an excellent food for cattle, and that it will soon be placed upon the market, but not under the name of corn cake.

The oil is already being produced at St. Louis, Mo., and at Harlem, near New York. It is also said that the Toronto Glucose Company have acquired the right to use the patent in Canada, and are prepared to work up 700 bushels of corn per day.

It is claimed that the process is of special benefit to the distiller, from the fact that it removes the fusel oil, which is a great detriment in the production of alcohol.

A correspondent of the *Canadian Pharmacy Journal*, who has carefully studied the process, says that by the process of grinding, which constitutes the peculiarity of the patent, the albumen or starchy portion of the grain is thoroughly disintegrated, while the hull, with the embryo, are completely separated.

The germ is obtained in the form of a flattened, white, horn-like substance, and is with difficulty pulverizable. On being subjected to pressure it yields a quantity of fixed oil, and a similar product can be obtained by the use of appropriate solvents.

The oil has for some time been known to chemists, but has not been made the subject of investigation. It is of a pale yellow color, which quickly becomes greenish by contact with copper. Its consistence or viscosity is greater than that of olive, and is similar to that of almond oil. The taste is at first bland, but is followed by some acidity, and the odor is sourish, recalling the smell of a baker's workshop or distillery. The specific gravity of the oil obtained by pressure is .92.

It is readily soluble in chloroform, carbon disulphide, and oil of turpentine; mixes less readily with petroleum ether and fusel oil, and is sparingly dissolved by cold alcohol, but more soluble in boiling alcohol, from which it is separated on cooling.

The germ yields to cold alcohol a small quantity of oily matter containing a volatile odorous principle, of a very decided and penetrating grain-like smell, strongly resembling that of crude spirit. The separation of the germ from the corn, prior to the mashing process, would probably enable the distiller to secure a purer ethylic alcohol than at present possible. The experiment is one well worth making. The corn does not contain any alkaloidal body which responds to the ordinary reagents.

**A NEW GLASS FOR THE MICROSCOPE.**—Some five or six years ago Prof. Abbey and Dr. Scott commenced a series of elaborate experiments, at Witten, in Westphalia, to devise some new description of glass by the increased refractory powers of which additional power might be given to the microscope. After two or three years of work their funds gave out; but as they had already met with marked success in their experiments, the Prussian Government was induced to extend sufficient aid to enable them to continue their work, which they did until the fullest success finally crowned their efforts. With the best glass as heretofore made, the full power of the microscope has been equal to the distinct discernment of less than the one-thousandth part of an inch; while with the new glass it is claimed that over less than the one-millionth part of an inch is plainly discernible. The microscope has always been regarded as a most wonderful instrument, but if this alleged discovery should prove all that is claimed for it, its powers will have been advanced to an almost incredible degree. Ordinary glass usually contains six substances. The new glass made by Prof. Abbey and Dr. Scott is said to contain 14 different substances, the most essential of which are phosphorus and boron, neither of which has ever before been used in such manufacture. The difference between the new and old glass consists in the difference of the two in their powers for the refraction of light. As the discovery was made by government aid, it has been given to the world free of any patent restraints.

**HOW INCANDESCENCE IS PRODUCED.**—Incandescence is a white heat, or the glowing whiteness of a body caused by intense heat. The little glass bulbs, says an exchange, with their brilliant horseshoe of glowing filament, attract no more attention than the flickering gas jet. But the facts about the gas jet are easily and generally understood, while the electric lamp is still a puzzle to many people. Both produce light by incandescence. The molecules of gas are rendered incandescent by the heat generated by the combustion of other molecules. The blue portion of every gas flame is where combustion is taking place, and from there comes the heat which keeps the rest in a state of incandescence. With the electric lamp it is the heat produced by the friction of an electric current compelled to go through a fine carbon filament, which raises that filament to a condition of incandescence and produces light.

## ENGINEERING NOTES.

**A GIGANTIC FEAT.**—Probably the heaviest operation in moving architectural structures was recently performed by hydraulic means in the city of Boston. The Hotel Pelham, at Tremont and Boylston streets, was in the way of the process of widening Tremont street. The hotel is built of freestone and brick, 96 and 69 feet frontage. The Boylston-street wall is supported on eight granite columns, 12 feet high, three and four feet square. There is a basement and seven stories above the sidewalk. Eight above tramways on which it was moved, 96 feet. Weight, 5000 tons, exclusive of furniture, which was not disturbed during the removal, as also were not the occupants of the stores on the first floor and some of the rooms, the various pipe connections being kept up with flexible tubes. The building was forced to its new position by 56 screws, two inches in diameter,  $\frac{1}{2}$ -inch pitch, operated by hand against timbers arranged to uniformly distribute the pressure against the building. Much care and ingenuity were displayed in the details, in the arrangement and work. Two months and twenty days were occupied in preparation. The moving itself was begun on August 21 and finished on August 25, but the actual time of moving was but 13 hours and 40 minutes. The hotel moved about  $\frac{1}{2}$  of an inch at each quarter turn of the screws. The whole distance moved was 13 feet 10 inches. Four thousand three hundred and fifty-one days' labor was required for the work. The whole cost was about \$30,000. This is the largest building that has ever been removed, although larger ones have been raised, which latter is a much simpler and much less risky operation. The complete success of this undertaking is shown by the fact that cracks which existed in the walls prior to removal were not changed by the operation. Paper was pasted over them, before commencing, that any change might be seen.

**NEW WATER WAYS FOR RUSSIA.**—Active preparations are being made for the construction of a canal to connect the White sea, in Northern Russia, with Lake Onega, which is already in water communication with St. Petersburg. The length of the canal will be only about 37 miles over a favorable country. Besides opening direct water communication between the Arctic ocean and the Baltic sea, vast forest, agricultural and mineral regions will also be rendered available to Russian industry and commerce. Vast fishery enterprises will also be called into activity. Another project which will undoubtedly be carried out at an early day is the junction of the Dwina with the Viatka, an affluent of the Volga; the other, that of the Kama with the Vyteghda, in the direction of the canal, now abandoned, called "Catherine of the North." The department of railways is also charged to estimate the cost of the lines of junction between Archangel and the northern system, this port being destined as the entrepot of Siberian products. It is contemplated to prolong the Louniew line in the direction of the Dwina, and also to connect the beds of the Kama and Vyteghda. In both cases the construction would be on a cheap and simple plan, adapted to the light traffic of these thinly-peopled regions.

**ELECTRICAL NAVIGATION.**—A boat propelled by electricity, with which experiments have for some time been made on the Thames, recently made a successful trip across the English channel, from Dover to Calais and return—24 miles each way. She is called the *Volta*, is 37 feet long, has 7 feet of beam, can accommodate 40 passengers, and is propelled by 61 accumulators 8 inches square, placed as ballast under the floor and connected with a pair of electro motors. The advantages claimed for this means of propulsion, compared with steam, are economy, absence of noise, simplicity of management, saving of space, absence of smoke, etc. It is stated that the whole cost of the electricity sufficient for the 24-mile trip to Calais was only \$2, and that a speed of 12 miles an hour can be obtained. The principal obstacle in the way of more general use of electricity on boats appears to be the necessity of frequently replenishing the accumulators.

**AN ENDLESS RAILWAY** has been invented—a jointed polygon composed of 13 wooden bars with rectangular bases, each attached by a hinged joint to its two neighbors. A short piece of rail is carried by bar. By shifting spokes the whole is connected to a common central pinion. The wheel of the vehicle has a U-shaped tire which turns inside of the articulated polygon. As the wheel, under the effects of traction, advances, the polygon also rotates. Comparative tests were made on smooth pavements, over which gravel was gradually spread. With heavy loads, running as high as five tons, the polygon had an advantage of 25 per cent over the common car.

**FROM NEW YORK TO BOSTON.**—A project is on foot to cut a canal across Conanicut island, at its narrowest point, to run a steamer direct from Newport to the Narragansett shore, and thence connect with the Shore Line by way of Kingston. This would shorten the route to New York nearly an hour, and would be of great advantage to summer travel.

## USEFUL INFORMATION.

## The Magney Plant.

The way in which the Mexican liquor, known as pulque, is collected from the magney or century plant is described by a recent traveler in Mexico as follows: "The magney is one of the most useful plants in Mexico. From the fibers of its leaves the Mexican makes his ropes and cordage, weaves various articles of domestic use, makes paper, and, what to him is equally important, from it he extracts his pulque and from this he distills his tocala, a liquor about as strong and intoxicating as fourth-proof Ohio strychnine whisky. To his credit be it said, the Aztec does not use it, for we saw not a drunken man among them all the time we were in Mexico, only seeing it once or twice in the hands of his Spanish rulers. When the plant has about arrived at maturity it shows a central stalk about to shoot up 10 or 12 feet and bear flowers and fruit. This the Indian cuts off, finding quite a large cavity below. In this the sap intended by nature to feed the stalk and produce the flowers and fruit is collected. This the Indian watches and tends carefully. On his back he has a pig-skin which has been taken from the animal as nearly as may be whole, as one skins a rabbit. Of course all the orifices but one small one are securely tied up. He inserts a tube into the small hole of the pig-skin and makes it air-tight by tying it securely. With his mouth he then exhausts the air from the skin and tube, and holding the end tightly he inserts it into the sap below in the reservoir of the plant, and the weight of the atmosphere forces the fluid up into the pig-skin. When full, he trots to the depot and empties it into a large cask, and it is ready for shipment and for use. As it is best when fresh, trains of cars run out of the city every night and return every morning loaded with large casks of pulque. It is distributed all over the city, and for a few cents per glass and a real (dime) per bottle everybody who likes is served with it from scores of shops in all the streets. It looks like buttermilk, tastes something like it and is scarcely any more intoxicating. Physicians recommend it for kidney and some other diseases. Attempts have been made by carefully bottling it to ship it to other countries, but as yet it is an experiment of doubtful success."

**CHEAPENING EMBROIDERIES.**—A machine which will create a material change in machine embroidery has lately been exhibited in Germany. One cause of great expense to embroiderers has been the necessity of engaging threaders, women or girls, who would thread the needles preparatory to their being placed into the machine. This new machine will, it is claimed, thread 18,000 needles in 10 hours, including all necessary delays, at a cost of about 50 cents, which amount of labor, under the present system, occasions an outlay of not less than \$3.50. It is stated that embroideries, with needles threaded by the machine, have turned out in every way satisfactory. Another apparatus has lately been constructed by a German inventor which is of great interest to Swiss machine embroiderers, inasmuch as it enables them to have the most difficult designs enlarged by less experienced hands than heretofore. The design is placed into a slide, and by means of a scripton is reflected on a table in its properly enlarged form, from which it may be very easily traced by one possessing only ordinary artistic abilities. The apparatus is so arranged that the frame holding the reflecting lens and the design may be regulated at will by means of a string suspended from the same, and the whole affair has the additional advantage of occupying but little room and being easily moved, owing to its light construction.

**A NEW JOINT MATERIAL.**—Portland cement mixed with a solution of calcium chloride rapidly acquires considerable hardness. Setting begins in three or four minutes, and is attended with an elevation of temperature that may attain to 70° C. A slight expansion is also produced in the course of setting. Cement mixed with calcium chloride softens, if it is plunged immediately into water; but after having been air-dried for eight or ten days, it may be so immersed without inconvenience or detriment to its cohesion and hardness. Ordinarily damp air has no influence upon the mixture. The fact that, according to the *Journal du Ceramiste*, the runners of cement mills are repaired with this chloride cement mixture is a sufficient indication of the great strength which the compound is capable of acquiring. The stones are put to work within an hour of repairing and the cement is perfectly resistant, and wears less than lead, which is commonly employed for the same purpose. All joints can be made with great facility, and acquire in a short time extreme solidity with this chloride cement mixture. The slight swelling during setting is very useful in filling the hollows and making good adhesion. The cheapness of calcium chloride permits the using of the mixture for numerous purposes. When great hardness and quick setting are desired, the cement may be used pure; but in general an equal mixture of sharp sand will be found to answer every purpose.

**TO CLEAN GLASS AND SILVERWARE.**—Eggshells crushed into small bits and shaken well in decanters three parts filled with cold water,

will not only clean them thoroughly but make the glass look like new. By rubbing with a flannel dipped in the best whiting, the brown discoloration may be taken off cups in which custards have been baked. Again, all of us are aware that emery powder will remove ordinary stains from the white ivory knife handles, and that the luster of morocco leather is restored by varnishing with white of egg. Nothing, it is said, is better to clean silver with than alcohol or ammonia, finishing with a little whiting on a soft cloth. When putting away the silver tea or coffee pot which is not in use every day, lay a stick across the top under the cover. This will allow fresh air to get in and prevent the mustiness of the contents familiar to boarding-house sufferers.

A BARREL contains 10,752 cubic inches. A box 24 inches long by 16 inches wide and 28 inches deep—that is, on the inside—will hold just a barrel. For half a barrel, make a box 24 inches by 16 and 14 inches deep. This will contain 5376 cubic inches, or just half a barrel.

**FLEXIBLE GLASS.**—Paper of proper thickness is rendered transparent by soaking in copal varnish. When dry, it is polished, rubbed with pumice-stone, and a layer of soluble glass is applied and rubbed with salt. It is stated that the surface is as perfect as glass.

**"NAUGHT" AND "NOTHING."**—Many seem to think that "naught" means "nothing," whereas "naught" actually means anything. This is to explain that it is wrong to say "naught" for the "cipher" (0), the proper term for which is "naught."

**IRON RUST IN DRY GOODS.**—Iron rust is readily removed by equal parts of common salt and cream of tartar moistened with water and applied to the stained spots and placed in the sunshine. Moisten as it becomes dry for two or three hours.

**THE ANIMAL LIFE COST OF OUR IVORY.**—It requires the annual slaughter of 100,000 elephants to keep the world supplied with ivory. England alone uses up the product of 30,000 elephants, or 1,200,000 pounds.

**POWDERED CAMPHOR**, added to oil or turpentine varnish, will allow it to spread more easily.

## GOOD HEALTH.

## A Word of Caution to Woolen-Mill Operatives.

Woolen mills are, as a rule, healthier places to work in than cotton or jute mills, because in the former the wool is kept carefully oiled throughout the various processes from the time it goes into the picker-house until it is spun into yarn or woven into fabric, when the oil is washed out; while cotton is worked without oil, on machinery that runs at a high rate of speed, so that the dust and fiber is much of it thrown into the air, where it floats continually, and getting into the eyes and nasal and bronchial passages of the operatives, causes irritation of these parts and often more serious inflammation.

Yet the very oil with which the fibers of wool are oiled in woolen mills may become a source of danger not less serious than the cotton flyings in cotton mills. It is still customary with owners of small mills located in the western and less populous eastern districts to take common soap-grease from the neighboring farmers and wool-growers in exchange for goods, or at a low cash price. This grease is sometimes very nice, sweet and pure, but more often it is such grease as the farmers' wives would not even make soap of, and is full of putrefaction and microscopic germs of disease. If this were all made into soap for scouring the cloth its unwholesomeness would be greatly diminished, if not destroyed altogether, for the strong lye acts as a deodorizer and purifier; but more often a large portion of this grease is used in its raw state for oiling the wool, and is thus brought directly and intimately into contact with the hands of the operatives.

It also penetrates into their clothing, and by the natural act of rubbing the face and scratching the head is distributed about the eyes and nose and into the scalp, so that hardly a portion of the body escapes contact with this foul grease. This refuse grease always contains more or less fatty acid, productive of humors, and frequently the fat of animals that have died of disease. If this comes into contact with the blood through cuts or abrasions of the skin, it is likely to produce blood poisoning, with its distressing and frequently fatal results.

Sickness would occur more often if it were not for the fact that the hands of the operatives are generally more or less covered with machine oil, which is most always largely, if not wholly, a petroleum product, and is a skin curative and preventive of humors and poisoning.

The safest way, and the cleanest way, is to use only mineral oils on wool, or at least an oil which shall be composed principally of petroleum fat, and to make all the soap-grease directly into soap. Mineral fats are now made with such care and skill that they are equal, if not superior, to the finest animal oils for oiling wool, and will lubricate and wash out perfectly. They are absolutely free from fatty acid or anything injurious to the skin. Indeed, they

are the bases of most of the ointments for healing skin diseases.

Much of the "breaking out" on the hands, arms and face, and much of the itching of the scalp, now so common among woolen-mill operatives, might be found to cease with a change from animal to mineral oil.

Manufacturers will consider the health and comfort of their employees, as well as their own health, now that this matter has been brought to their attention.—*Hall's Journal of Health.*

## Boys and Cigarettes.

The city council of Oakland has recently done two very wise things: First, in passing an ordinance making it a misdemeanor for boys under the age of 16 to smoke cigarettes in any public place; and second, in passing a "curfew" ordinance, requiring the city hall bell to be rung at nine o'clock every evening, after which hour every young person under the age of 16 must go directly home and keep within doors until morning. The first ordinance, we understand, is promptly enforced; but we do not hear of any arrests for those ignoring the "curfew," and those whose business keeps them on the street after that hour are very much surprised at the great number of quite young-looking boys and girls whom the police seem to regard as having passed the proscriptive age.

Cigarette smoking, by young boys, has become an alarming evil in both Oakland and this city, and the ordinance referred to, if properly enforced, cannot fail to have a good sanitary effect, while it will also accomplish much moral good otherwise. In nine cases out of ten the boy who gets the habit of cigarette smoking well fixed upon him will have his days largely shortened and never amount to much in any way. An inveterate cigarette or cigar smoker gives very little promise of any very extended or useful future. A large portion of that class fall into the ranks of dillards, while all are more or less affected with a weak brain and decided lack of stamina.

The German Government understands this matter fully and has placed its interdiction upon the habit with boys of under age, giving as the reason that a young man who thus abuses himself can never make an effective or useful soldier; and all male Germans are required to give at least three years of their lives—from the age of 21 to 24—to active duties as a soldier in camp. To be serviceable to the Government it is considered necessary that they should not allow their intellect and physical strength to be undermined with the pernicious habit. And yet the Germans, as a nation, are the greatest smokers in the world. But under present laws they are not allowed to incur the habit until the physical system has become fully developed and in a better condition to withstand the poisoning and debilitating influences of tobacco. Is Oakland to be alone in taking care of her embryo citizens who are going to the bad? Will not San Francisco also assert herself in this direction? Just what the moral difference is in the act of smoking one day short of 16 and two or any number of days after, we cannot see, but as that question is not just now a matter of discussion, we should try to be thankful for even the small modicum of good sense that might be evinced by our city fathers if they would follow in the good way, only so far as the Oakland council has gone.

**TETANUS TREATED BY REST.**—Dr. De Renzi states, in the *Rivista Clinica*, that by treating patients with traumatic tetanus by means of perfect rest, he has been able to restore four out of five to health; whereas when treated in other ways these patients usually die in two or three days. He places the cases in a special room, where absolute silence reigns. Even in the passages leading to it, and in the neighboring wards, care is taken to lay down carpets so that no sound shall penetrate the tetanus ward. The door of the latter is, of course, well oiled, so as to open and shut noiselessly, and the patient's ears are stuffed with cotton wool, he himself being strictly enjoined not to make the slightest noise. He must, of course, be fed. This has generally been considered impossible, the teeth being clinched and the spasmodic contraction being increased by attempts to masticate. The obstacle may, however, be easily overcome; by parting the jaws and introducing liquid food, swallowing is accomplished without difficulty. This method of treating traumatic tetanus has been tried with success by several Italian practitioners—Drs. Pisani, Maragliano, Riva, etc.

**THE THROAT.**—The throat is a wonderful instrument of music. Place the fingers upon it, and every time you speak you can feel the vibration of the musical organs. Anything that ever touches the throat impairs the purity of those sounds. Throw a cloth over the strings of a piano or violin and get music out of it if you can. So every piece of cloth which surrounds the throat impairs the sweetness of the voice. Women go with necks bare; men have theirs swathed and bandaged, and 10 women have sweet voices where one man has. A man's voice should be as pure as a woman's. Why not? He is shaved and choked. God has provided a covering for a man's throat, light and soft. It clothes the neck and preserves the health. But man gets a sharp iron, scrapes his neck and face, ties a rag around the former, takes cold, has a sore throat, bronchitis, consumption, and dies.—*Christian Advocate.*

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Alameda.

**MAGNESIA MINE.**—Livermore *Herald*, Oct. 7: Seven men are now employed by Messrs. Stanley & Bartlett in the Cedar Mountain magnesite mine, and the rate of production has correspondingly increased. John Hayes has now eight pack animals in his mule train. The first carload leaves for New York to-morrow.

**NEW CLAIM.**—Ab. Mendenhall, James Mendenhall, and Douglas Mendenhall have discovered and located magnesite claims on section 2, on the west side of Cedar mountain, just below the peak known as "Sugar Loaf." There are several slides, and apparently a number of good veins. They will begin prospecting them this week.

## Amador.

**FRENCH CAMP.**—Cor. Amador *Ledger*, Oct. 9: We have got an enterprise in our neighborhood which is attracting some attention in the way of quartz mining. Doc Marshall has fitted a quartz mill on the old Markley mine, which he runs by mule power; works splendidly; not very wearing on stamps, as one stamp goes up in the morning and comes down in the evening. The mill is at a standstill at present on account of having the mules take the bullion below.

**SUTTER CREEK.**—Amador *Ledger*, Oct. 9: As predicted in my very last, operations at the Lincoln have come to a standstill. Everything above water level has been worked out, and until some adjoining mine is started and the water lowered, the mine will have to remain idle. A few men have been put to work at the Mahoney, and the tunnel they are running is being pushed with a double shift. They are now running north to intersect the opening made by Mr. Stewart, and in all probability a track will be laid to the Lincoln mill, which they will most likely use for crushing rock, as there is no pipe connection from the Mahoney mill to the Amador canal.

**SUNNY SOUTH.**—Amador *Dispatch*, Oct. 7: The Sunny South mine near Mace's mill, owned by C. C. Garner & Co., is now being worked, with flattering prospects ahead. They have their shaft now down about 40 feet, at which depth they have some very good ore.

## Butte.

**HELLTOWN.**—Cor. Butte *Record*, Oct. 9: Mr. Bowman, one of our persistent miners who has been driving a tunnel into the hill on the east side of the creek for the past 18 months without finding pay, was, a few days ago, rewarded partially for his labors by striking into gravel that pays \$6 per day to the man, and a good prospect for a continuance of the same pay. Such men deserve the smiles of Him who is ever mindful of our deserving wants. At, or near Helltown, Messrs. Hawley & Gale have opened up an old ravine that was worked in the days of '49. It was, as they used to term it, "guttured." That is, running a narrow cut up the ravine and paying no attention to outside dirt, which has often proven very rich. Such was the case with the ground upon which the above-named gentlemen have located. They were at much expense opening up their claim and getting it in working shape, having to clean out the ravine, cut down bedrock preparatory for their flumes. Another impediment was the crossing of the traveled road. This they have bridged in a substantial manner, making the crossing much better than before, and for which I think the county ought to remunerate them. Their claim is now in working order. They have 500 feet of flume, consequently they will save nearly all their fine gold. Where it was supposed to be but six feet to the bedrock they found it 20 feet, and the bottom strata well charged with gold of a very fine quality. A side drift was made and the drift dirt paid \$6 per day to the man. They are highly pleased with their prospects. I visited their diggings and judge they have a rich and lasting claim.

## Calaveras.

**ANGELS.**—Cor. Calaveras *Chronicle*, Oct. 9: The mines in this section now closed down for lack of water will all start up shortly. The water will be running in the Union Water Company's ditch within three weeks. A large number of the men employed on the ditch returned to Angels during the week, having completed their work. The carpenters and a few local hands are all that have been retained to finish up. The Utica Mining Co., in this place, cleaned up the batteries of their mill last Saturday, after a run of three weeks, the result of which was 38 pounds and 7 ounces of pure gold amounting to about \$8000. A recent rediscovery of an old-time gravel mine on Old Gulch, situated between this place and San Andreas, has been made. The gravel mine in question was worked about 27 years ago by R. B. Rhodes, who recently made the rediscovery. At that time what gravel was mined paid handsomely, but through lack of practical mining knowledge the course of the channel was lost, and being unable to find it the mine was abandoned. Mr. Rhodes returned to his Eastern home in Ohio in 1857, where he resided until within the past few weeks, having returned to the scene of his early mining operations, and instituted search for the property he had so long ago abandoned. During the years of his absence, a large landslide covered the entire spot where his work had been performed. After a careful search Mr. Rhodes has found the mine and will begin operations thereon immediately. During all the above-named years, this mine has been concealed from the gaze of the critical prospector, Messrs. L. A. Grim and Jas. Harris, of Angels, have been selected as partners in the above-named property.

## El Dorado.

**DOGTOWN.**—Cor. El Dorado Co. *Republican*, Oct. 7: Tony Vaughn and Louie Sheiber have located the deep gravel placer mine joining Henson on the north and Lane & Fitzgerald on the west, and are preparing to drive a tunnel in from the north side at Henson's line, a distance of 800 feet. Rich gravel on all sides justifies the belief that a rich chamber is inside, and Tony and Louie are going to take a look. Frank Becherer and Joe Myer have located the Barney Gulch claim, which was famously rich 30 years ago. General activity prevails throughout the district. Miners are preparing to

work their claims, and the farmers are putting up hay and building stock sheds.

**GARDEN VALLEY MINING NOTES.**—The Slate Mountain mines are still turning out gold in paying quantities, and the courteous superintendent informed me the mine never looked better. They are sinking below the 200-foot level and progressing favorably. The New York mine adjoining the above mine on the south is opening up splendidly. The Grover boys have sunk a shaft 70 feet and driven a tunnel 150 feet, showing a two-foot ledge of good ore the entire distance. This mine will yet prove a worthy rival of the Rip Van Winkle, as the Slate Mountain is called. The Darling mine, west of Slate Mountain, is showing well. This mine is not opened to any great depth—about 50 feet or more. A level has been run north 120 feet, showing good milling ore. I have been informed that an Eastern company are to commence operations on this mine at once. It is reported that there has been a good strike made in the Alhambra mine. Work on the Alpine mine continues. A ten-stamp mill is to be erected in a short time. The California Jack mine is looking well, and if owned by a party who was able to operate it as it should be, would soon turn out bullion in paying quantities. The Taylor mine, under the management of Supt. Wickham, is being pumped out and being retimbered where required; will soon be clear of water, and expects to have the mill in operation at an early day. The Lone Jack mine has its mill nearly completed and will commence crushing next week. The ledge is large and easily worked; the ore is called low grade. The ore can be mined and milled at an expense not exceeding \$1.50 per ton. The ore will pay \$6 or \$8 per ton. The ledge is 23 feet in width at a depth of 40 feet, and is, no doubt, on the main mother lode, the rock being what is known as ribbon quartz. Sinking on the Esperanza mine is to be commenced next week and not suspended until the 200-foot level is reached. This mine is on the same ledge as Lone Jack and is prospected to a depth of 150 feet; at this depth the ledge is 30 feet wide and all carries gold, and could be worked profitably, but requires not less than 40 stamps to handle the ore as it should be.

**ANOTHER STRIKE.**—Record-Union, Oct. 6: A correspondent, writing from Coloma, El Dorado county, says that a miner by the name of Jacob Warf struck a pocket in a porphyry ridge, a few miles beyond that town, recently, which promises to make him rich. It is on the summit of a hill, two miles east of the mouth of Dutch creek. He has to carry the pay dirt, or rotten porphyry, on his back, two miles, over a steep hillside; but it pays him \$100 a sack. He has taken out over \$6000, and, like Colonel Sellers, he thinks there's "millions in it" yet.

**NEW YORK.**—Placerville *Observer*, Oct. 9: We were shown some exceedingly rich quartz specimens by L. Landecker the other day, taken from the old New York mine. The ore is heavily charged with sulphurets and fine gold, besides being of the specimen quality. Mr. Landecker also informed us that the ore body was coming in better in quality and quantity, and gave every assurance of its permanency.

**TUNNEL.**—Georgetown *Gazette*, Oct. 9: The contract let by Mr. Morton about six weeks ago for running 250 feet of tunnel on the Hart mine will be completed in a few days. It was let for \$1.96 per foot. Tom Williams and Owen Roberts, of Placerville, and John Poor, of this place, are the contractors. Tanksley & Austin, of the Mount Hope mine, one-quarter mile south of the Alpine, have been prospecting their claim during the past few months with highly-encouraging results, and are now engaged in running an open cut to sluice on a larger scale this winter. We have it from reliable source that two more quartz mines in this district have been, or are about to be, taken hold of by capitalists who mean business. The mining outlook is good.

## Fresno.

**WIDENED.**—Fresno *Expositor*, Oct. 11: The Golconda mine in Fine Gold district has widened out to a six-foot ledge that runs from \$30 to \$40 per ton. This mine is about a mile north of the Hildreth mine, and is now believed to be next in importance to the McNally mine.

## Mono.

**BULWER CON.**—Bodie *Miner*, Oct. 11: We found a tunnel driven on the surface, on the Washington vein, 190 feet into the hill. The face of the tunnel is within 75 feet of the Bulwer shaft. From this tunnel there is a winze to the 200 level on this vein. Along the course of same vein, the last 100 feet has two feet of ore in it which assays as follows: \$22.35, \$13.07, \$44.79, and \$13.16. We have commenced work at this place. We are now taking ore from the surface tunnel letting it down to the tunnel level, also from the 100, 200, 300, and 400 tunnel levels; assays from all these points will give a good profit over all expenses. The mill will commence to-morrow on Bulwer ore.

**THE STANDARD CON.**—The Bulwer Company requiring their side of the mill, a cleanup was made during the week, also of the tailings on the Standard side, and the crushing of ore was resumed on Saturday, 9th.

**THE BODIE.**—South upraise from 700 level is extended 24 feet. Winze from 700 level is extended seven feet in fair ore. North drift from west cross-cut on 700 level is extended nine feet. South drift on 800 level is extended 30 feet.

**THE MONO.**—We are taking out rich ore below the 700 level.

**THE DUDLEY.**—The south drift 700 is extended 10 feet with no change.

## Napa.

**SHIPMENTS OF QUICKSILVER.**—Napa *Reporter*, Oct. 8: During the month of September, 347 flasks of quicksilver were shipped from Calistoga. Of this, 156 flasks were from the Sulphur Bank mine, 116 from the Great Western, 54 from the Napa Consolidated, and 21 from the Bradford. The Sulphur Bank mine, since a couple of assessments have been paid on its stock, is doing well, and is making money for its stockholders. The increase in the price of quicksilver has had a direct tendency to increase the productions, as the above shipments from Calistoga last month are largely in excess of the shipments of former months for some time back.

**ÆTNA AND OAT HILL.**—Napa *Reporter*, Oct. 6: The Ætina and Oat Hill quicksilver mines are both running full blast. At the latter mine they are

working for the most part on the 200-foot level, where they recently discovered good pay rock. Mr. Newcum, the new superintendent, has made a number of improvements at Oat Hill since his arrival, and seems determined to work this mine for all it is worth.

## Nevada.

**MEADOW LAKE.**—Cor. Placer *Herald*, Oct. 9: The work of repairing the Excelsior mill and attaching the new machinery is about completed. The rock-crusher has been in operation at intervals during the past two weeks, but no continuous working in connection with the more complicated parts of the works has been done, so as to fully demonstrate the complete practicability of the plan, nor the yield or cost of mining per ton. One test of the crusher showed a half ton of rock reduced in 29 minutes. From the fact that large preparations are being made to increase the working facilities in many ways, gives evidence of satisfaction. They have a small force getting out rock, with about 1200 tons or so mined within a quarter of a mile of the mill. They have 200 cords of wood cut and teams are at work hauling at \$10 per day each team. Proposals are offered for hauling the ore. We have had a few visitors during the last week and a few claims were located. There were represented during the week one English company, two Eastern companies, one Colorado and one San Francisco company, and from the interest taken it is no more than reasonable to suppose that this will be a lively camp another season. Each of the companies referred to has its own theories and peculiar methods of working. There are immense deposits of mineral wealth within a space of ten miles, and it is confidently expected that within the coming year a new life will be infused into this district. Certain it is that there will be a revival of mining industry here the coming year, which will determine the future of this district. There have been so many failures that it is but natural to suppose a great deal of doubt and skepticism should be manifested. On the other hand, there is great faith and confidence, and the vigilant eyes of the capitalists are keenly scanning the surroundings, as there are many enterprises incidental to a prosperous camp, besides mining. Every day's examination of the mining region shows more and more to me its vast extent.

**CROWN POINT.**—Foothill *Tidings*, Oct. 7: Very extra rich quartz is now coming out of the Crown Point. Yesterday six boxes of specimens were taken out of the 220 level, and last night two boxes of quartz filled with gold came out of the 300 level. The ledge where this rock comes from is about three feet thick. The Crown Point furnishes good milling ore all the time, and about every two days sends out ore that is almost bullion.

**LONE TREE.**—Grass Valley *Union*, Oct. 8: The new steam pumping and hoisting works of the Lone Tree mine are now running in good style, and the shaft has been sunk to the depth of 180 feet. The vein of ore in the shaft prospects well in free gold and carries plenty of sulphurets of good quality. Everything looks favorable for the development of a paying mine. The underground work of the Gold Point mine has been well advanced this season, and a large amount of drift run, above which stopes will be opened up. The ditch for the North Star pipe line has nearly reached Wolf creek from the Empire line. The pipe line will pass close to the Larimer mill and the hoisting and pumping works of the New York Hill Co. There is a large force of carpenters at work preparing the timbers of the new North Star mill. The stone work for the foundations of the mill is in a forward state.

**A PROMISING MINE.**—Nevada *Transcript*, Oct. 6: The Washington Mining Co. have recommenced operations on their ledge in Washington mining district, and have a first-rate showing. The ledge runs nearly due north and south and is almost perpendicular. It has been developed 650 feet on its course to a depth of 80 feet, showing the vein to vary in width from one to seven feet. The chute in the vicinity of the shaft has been developed over 100 feet in length, and will mill \$20 per ton. The company have started a tunnel on the course of the ledge to undercut the shaft 100 feet. Already good milling rock has been struck in the tunnel where the ledge is two feet in width. The ledge is in slate and carries a gouge on the footwall. Sinking has been started on the vein from the bottom of the shaft, and the ore being extracted therefrom is full of free gold and galena sulphurets.

## Placer.

**CLEANUP.**—Placer *Herald*, Oct. 9: Shurtleff, Robinson & Co. have just made a cleanup of crushings of a portion of the rock taken from their recent strike in the Doig mine, just below Ophir. The amount realized by this cleanup is a little more than 1259 ounces, or nearly \$20,000. Only a portion of the rock already taken out, and it is said probably not the best of it, has been crushed.

**QUARTZ MINING AT AUBURN.**—Grass Valley *Union*, Oct. 6: Wm. and Sampson Hales, of Grass Valley, are operating the Baltimore quartz mine near Auburn, which they have been developing for the past nine months. The mine is now opened sufficiently to keep a ten-stamp mill going nearly constantly, and in a few weeks more the stopes will yield a full and steady supply of quartz for the mill. The quartz is of fair milling quality, and of late the ores have shown decided improvement.

**GOOD PAY.**—Foothill *Tidings*, Oct. 8: The Watts brothers at Iowa Hill, Placer county, with only four men at work, took 250 ounces of gold from their claims during the last month. That is about \$875 to the hand. Stop mining; there is muddy water in the brooklet that disturbs the troutlet.

## San Bernardino.

**HOLCOMB VALLEY.**—San Bernardino *Index*, Oct. 9: Hundreds of old prospect holes, with here and there some old dilapidated rocker, attest the vast amount of placer mining that was done in the valley long years ago, and the old settlers all remember the large bucketfuls of dust that were taken from the earth. At present the attention of those who are at work in the valley and surrounding country is turned exclusively to quartz mining. For some years only a few arastas were worked by the Mexicans. But as it became apparent that a war was to be waged against silver over which politicians and financial magnates would contend for mastery, then the many gold mines of this region that had so long remained idle sprang swiftly into notice. An *Index* reporter visited Holcomb Valley recently and found among the most notable of the mines that are now being

worked were the old Baldwin mine, now the property of Samuel Beard. About the first of June, Major Dignon entered into an arrangement for the development of the mine, and since that time has had a force of men constantly employed running drifts and sinking upon the mine. The result so far has been satisfactory, and the Major and his associates are now at the mine. The probabilities are that active operations will be begun at once for the erection of a mill and extensive working of the mine. Col. Loveland has commenced operations on the old Mammoth mine, one of the group that was formerly the property of the Holcomb Valley Mining Company. This mine is said to be the oldest location in the valley. Many years ago a mill was erected near the mine. When the reporter was in the valley the old stamps had just dropped for the first time in 12 years. Considerable work was done on the mine. The ore at the surface was free, and so long as that lasted, paid well. But water was encountered, and the ore began to carry a large per cent of sulphurets, thus rendering it necessary to adopt other modes of treatment. Col. Loveland has recently made a short run with Mammoth ore with satisfactory results.

The Metzgar Bros. have had about 12 tons of ore from the Zaragoza mine worked at the mill, and we understand the cleanup was very good. The Metzgar Bros. have one of the finest prospects in the county for the amount of work done on their property. Besides the Zaragoza they own two mines adjoining, which are looking exceedingly well. To the north of the Mammoth mine, about 1½ miles, Ed. Golliday is at work developing a mine that bids fair to be as good as the best. The ore is rich and the croppings extensive and well defined. James Ward, of Los Angeles, has been at work for several months on the old Osier mine; also Mr. Burnap on a mine in that vicinity. These mines are also among the earliest discoveries in the valley, and we believe only require the application of new and improved machinery to make them pay a handsome profit. About ten miles to the westward of Holcomb valley lies the Green Lead, once the property of William Wozencraft, but now owned by Richard Garvey, of Los Angeles, and under the management of a Mr. Godfrey. This mine for several years past has been worked at intervals, the ore being reduced by arastras run by water-power. It has always paid a profit, and now the company propose to work the ore at their mill at Cox's ranch, some three miles distant, and where they have several other mines. There are scores of undeveloped gold mines in this immense region, and many opportunities and inducements for the investment of capital.

## Santa Clara.

**LIGNITE.**—San Jose *Herald*, Oct. 7: A large ledge of coal has been discovered on the land of E. P. Fellows, on Stevens creek, about five miles northwest of Saratoga. It averages six feet in width, is of unknown depth, and the croppings have been traced for a mile or more. A pit has been sunk to the depth of 12 feet, and a specimen of the coal taken out at that depth has been brought to town. The specimen is taken from so shallow a depth that it would be difficult to form a reliable opinion of the value of the coal. It appears, however, to have the general character of the Pacific Coast coals—that is, it is lignite. The surface specimen under notice is light and is inferior to other Pacific Coast coals, but a deeper shaft may develop a good article. Its unusual lightness is due to a lack of the average amount of bitumen; but as the Santa Cruz mountains are charged with bitumen, asphalt, petroleum and kindred substances, it may be naturally expected that deeper digging will discover a heavier bituminous coal. The lignites are inferior to other coals for general use, containing less carbon and more water and generally leaving a large percentage of ashes. There are many special purposes for which they are useful. The value of the ledge near Saratoga, if the coal proves good, will depend on the facilities for getting it to market.

## Shasta.

**IRON MOUNTAIN.**—Shasta *Courier*, Oct. 9: Iron Mountain will soon boom again, and the next boom will be permanent. There is enough paying ore in sight on that mountain to keep a dozen big mills and 1000 men employed for a quarter of a century. The \$120,000 expended on useless but costly machinery in the mill there was one of the many stupendous blunders made in new mining districts on this coast.

## Sierra.

**ANOTHER STRIKE.**—Tribune, Oct. 9: We hear that Van Trump & Co. have struck a fine lode out near Packer lake, about eight miles north of Sierra City, and are now running a tunnel on the vein. The ore is said to be worth about \$30 a ton. We believe Sierra City is the center of the richest gold quartz belt in California. Capitalists who won't look at mines now offered at \$50,000 and \$100,000 will be begging for stock in the same mines when they are selling at a million.

**THE PHOENIX STRIKE.**—The striking of the ore vein in the Phoenix last week made everybody look smiling. Reports from those who have visited the mine say that there is between three and four feet of very high-grade ore in the drift they are now running on the vein. Had this strike been made two months ago a fine mill would have been built this season, but we expect the owners will put in the winter in developing the mine.

**GOLD VALLEY DISTRICT.**—They are going to work at the Gold Valley mine with a will. Mr. Turner went over Monday to take charge of the brick-making, and there has been a constant demand for more men. The superintendent is determined to have his furnaces up this fall and as much done on the new works as possible. We hear that a contract has been let to deliver 2000 cords of wood and a supply of timbers for the mine. The company will build and operate a sawmill near the mine. Such companies as this is what makes a country. Reports come from Gold Lake that the old incline on the Forest Queen is cleaned out and they are now running south on the vein, with four feet of splendid ore in the drift. The cleanup at the Young America for the month of September amounted to \$37,500. The Sierra Buttes cleanup for September was \$27,000.

## Trinity.

**NEW RIVER MILL.**—Humboldt *Times*, Oct. 6: A new stamp for the custom mill of Toms & Dean, at New River, was sent up by the train from North Fork yesterday. The gentlemen above named have been running with one stamp, having a capacity of

two tons a day, but orders were coming in so fast that they could not fill them all. The rock that is being run through now comes from the Ridgeway mine, and it is asserted the company has in sight a sufficient number of tons of the ore to keep the mill busy for over a year. The rock is said to be of more than average grade.

## NEVADA.

## Washoe District.

**CHOLLAR.**—The work of removing car tracks, air-pipes and stripping the 3100 level was begun yesterday. The water is now up to the roof of the station on the 3200 level. The valves of the hydraulic pumps on the 3000 and 2600 levels will be left open in the retreat. By so doing the pumps can be started under water if the management should reconsider their resolve to abandon the levels below the 2400. The hoist engine and building at the old works have been put in thorough repair preparatory to reopening the upper levels. The 1100 will be the first attacked. A west drift will be sent in to tap at that depth the vein which yielded a vast amount of low-grade ore between the surface and 250 level.

**CON. CAL. AND VA.**—During the past week 1057 tons and 1945 pounds of ore were shipped to the Morgan mill. The average value of the ore milled during the week, according to assays from battery samples, was \$19.53. Bullion of the assay value of \$18,645.54 was shipped to San Francisco since last statement.

**HALE AND NORCROSS.**—The flooding of the 3200 level has caused a total suspension of operations. If a satisfactory arrangement is consummated with the Chollar management, operations will be transferred to the 2800 level. The ore deposit cut at that depth in sinking the main incline winze may develop into importance when explored.

**UTAH.**—*Virginia Chronicle*, Oct. 11: Have completed cutting a station on the south side of the shaft, 472 feet below the surface, which corresponds with the 520 level in the Sierra Nevada mine, and have started a west drift which is out 44 feet.

**OSBISTON SHAFT.**—Repairs to the timbering of the main shaft are completed. A station is being excavated in the southwest drift on the 2500 level, 450 feet from the shaft. A winze will be sunk at this point.

**SAVAGE.**—The south drift on the 600 level is out 350 feet beyond the north line, and will be pushed to a connection with the Savage shaft as speedily as practicable for the purpose of securing an air supply.

**BEST AND BELCHER.**—From east crosscut No. 1 near the face a south drift was advanced 33 feet. This drift is run for the purpose of draining the water from the main east drift.

**MEXICAN.**—Operations confined to extending the joint Union Con. crosscut.

**OPHIR.**—On the 1465 level the timbering of the south drift from the Ophir shaft is being repaired.

**YELLOW JACKET.**—Ore shipments for the week ended Oct. 9th aggregate 1100 tons.

## Gold Mountain District.

**A PROMISING COUNTRY.**—*Dayton News-Reporter*, Oct. 5: A. B. Williams, the well-known millman and metallurgist of Reno, passed through Dayton last Saturday on his way to Candelaria. From there he goes to Gold Mountain to erect and take charge of a Huntington quartz mill for B. F. Leete & Son. It will be remembered that those gentlemen went to Gold Mountain less than two months ago on a prospecting trip. They have been very successful. They now employ about 20 men on tribute work, and are developing several very promising gold-bearing quartz ledges. The ore is free milling and easily extracted, and the Messrs. Leete feel confident that they are the pioneers in a country which will soon receive a genuine boom.

## Highland District.

**BODY OF ORE.**—*Pioche Record*, Oct. 2: Col. Baxter, supt. of the Arizona mine, at Highland, reports a fine body of ore in the mine. The Colonel expects to leave at an early day for Philadelphia, for the purpose of conferring with the owners of Temple mining property as to the advisability of erecting a mill in that district. The Colonel estimates that a 10-stamp mill can be placed there for \$60,000.

## Jackrabbit District.

**ONONDAGO.**—*Pioche Record*, Oct. 2: A half-dozen persons took a trip out to Jackrabbit during the week, and visited the Onondago mine. They saw a much better mining property than expected. All are of the opinion that a jumbo is at hand. The ore keeps improving in richness, and the day is not far distant when the 'Rabbit country will elevate its ears and tail higher than ever.

## Pioche District.

**RAYMOND & ELY.**—*Pioche Record*, Oct. 2: They are not getting ahead with the timbering and getting down through the Raymond & Ely shaft anything like as rapidly as anticipated. Great trouble is experienced at certain points in keeping the dirt from sliding down so the work can be pushed ahead. Preparations will soon be made for the resumption of work at Bullionville. A new process for the working of the rebellious tailings will be tried, and is hoped will prove successful.

## Railroad District.

**HIGH-GRADE ORE.**—*Elko Independent*, Oct. 6: Geo. Williamson, of Bullion, informs us that the mines in Railroad District are producing large quantities of ore of high grade, upon which the furnace is now running successfully. The present run will include about 2500 tons of ore, the result of which will be a yield of bullion equal in quantity and value to all that has been heretofore produced during the present season. Stoker's big teams will soon commence the transportation of the bullion to this point for shipment.

## ARIZONA.

**WALKER DISTRICT.**—*Prescott Courier*, Oct. 8: N. L. Griffin, a pioneer of '63, has come down from Walker mining district. He brought with him a contribution of rich ores, which may be seen at Bones' ore rooms, alongside two or three sacks of very rich silver ore from the Silver Trail mine, Has-

sayampa district. Mr. Harris yesterday shipped a boiler and more lumber to Ellsworth district, where he is putting up a mill to reduce gold rock, of which there is abundance there. He has now sent down about 300,000 lbs. of machinery, lumber, etc. Mr. Baird is his superintendent.

**GRASS VALLEY.**—*Silver Belt*, Oct. 6: Fred Hefte, who was in from Payson this week, expresses a high opinion of that section as a mineral country. Gold-bearing quartz abounds and silver is also found in paying quantities. All that is needed to make it a good chloriding camp is a mill to work custom ores. The Golden Wonder mine, recently bonded by Dr. Trippel, is spoken of as a valuable property. From very small croppings and a narrow seam, for some distance below the surface, the ledge has opened out wide and strong in the lower levels and its permanency and value are established. The Ocoila, owned by Chas. Bacon & Co., is another good gold mine. The country toward the Verde is said to be rich in carbonate ores, running from 40 to 60 ounces in silver and 15 to 20 ounces in gold. Fred has been prospecting the Green Valley and Verde country during the past two months and is well satisfied with his work, having located several promising prospects.

**A NEW DISCOVERY.**—*Mohave Co. Miner*, Oct. 10: We have always maintained that this district, and, in fact, all the mining districts of the county, has never been prospected in the true sense of the word. As an illustration of this we have only to mention that a few days ago, while coming from his work on the Keystone mine, Dan Holloway picked up a piece of rock which had been broken off by some wagon wheel in the road, just above Judge Williams' house and found it to be good chloride ore. In looking for the place from which it had been broken off, he discovered indications of a ledge running across the road. He informed Mr. Moses, the owner of the ground, of his discovery, and a few hours' work with pick and shovel soon developed the existence of a large ledge of good chloride ore. Several pieces of the ore were then broken up and sampled, and the assay returned 172 ounces to the ton. Messrs. Holloway, Moses and Trimball have been working on this new discovery all the week and have several sacks of good ore as the result. The lead being largest where it crossed the road, a shaft has been commenced at that spot, previous to which it was necessary to make a new road. Several more samples have been sent to Kingman for assay, and the work of development is going right along. We wish the parties success in their new find.

**TOMBSTONE.**—*Epitaph*, Oct. 8: There is a better feeling in town than there was immediately after the mines closed down. This is evidenced by the fact that it is much easier to dispose of property now than it was then. Our citizens have recovered from their first scare, and on second thought have come to the conclusion that the present dull spell is only one of those incidents in the life of mining camps. The business outlook for Tombstone during the ensuing year is most encouraging.

**QUIJOTOA.**—*Tombstone Democrat*, Oct. 7: H. B. Murray, owner of the Locomotive mine at Quijotoa, has leased the Bonanza mill, and will commence running it on Locomotive ore in a few days. This will be the first move in starting up the Bonanza camp again.

## COLORADO.

**UTE CREEK.**—*Idaho Springs News*, Oct. 3: Among the prominent mines passed was the Humboldt, the owners of which had a mill run lately that gave 25 ounces gold and 40 ounces silver per ton, or at the rate of \$540 per ton. Next came the Ouida, formerly called the Cascade. Six or eight men are employed, and ore is being shipped which runs over \$200 per ton. Farther up and to our right is the Argosy group of mines, lately sold to Messrs. Hall, Ely and their associates. The Argosy is supposed to be an extension of the Argo and is a very desirable property, having produced some excellent ore. The Bald Eagle, owned by the same party, was discovered in 1865 by R. B. Griswold, and produced some fabulously rich ore—nothing like it was ever seen in the country. It is now being leased by some Italians, who pay the owners a royalty of 40 per cent. At the time of our visit a splendid quality of ore was being taken out. Almost on a line with this, but further east, is the famous Argo mine, with its substantial shaft-house and hoisting works, with ore-houses constructed out of hewn logs. The buildings are situated in a depression of the mountain, the upper stories being so constructed that huge timbers are slid in from the top, and under cover are cut up and made into framework for the shaft, which is a three compartment. This is a most convenient and economical way of doing that class of work. The engine is supplied with all the late improvements. The boiler is bricked in and the fire-grates have been built for the economical burning of wood, very little being required to keep up steam. The ore sorting-house is a long, comfortable building constructed of hewn logs. At the time of our visit about 10 men were busily engaged in sorting ore and putting it in sacks preparatory to shipment.

## IDAHO.

**CEUR D'ALENE NOTES.**—*Record*, Oct. 6: Good pay is being taken out of the Last Chance placer claim. There will be another cleanup at the Buckskin placer bonanza to-morrow or next day. Davidson & Meyers, at the mouth of Buckskin gulch, took out \$200 last week, only two men working. The gross cleanup on the Grove placer claim was \$880. This was the result of the labors of three men. The first iron ore car in the Ceur d'Alene mines was placed in the Small Hopes mine yesterday. It runs like a charm. Bennington & Waite have struck rich galena ore in the Cressus mine on the Belknap summit. The vein is 15 feet wide, Frank Olen-dorf, foreman of the Margaret mine, started out this morning with a wagon load of supplies and a force of eight men to work the mine. The Treasure Box arastra is grinding away at the rate of two tons per day. The rock looks well and the owners anticipate a good cleanup in a few days. The Gellatt placer claim is being surveyed for the purpose of obtaining a patent. X. S. Burke has the job, but has employed Loring & Lucas to assist him. Another good cleanup was made on the Mother lode arastra yesterday, and Uncle Billy is ready to put up his assessment to the Republican campaign fund. J. T. Rob-

erts has charge of a force of men at the Golden King mill, and is placing the new stamp mill in position. Only a part of the machinery has arrived; more is expected to-morrow. It is expected that within three weeks the mill will be in operation. Under the direction of Jim Hawes, work has been begun on the Henry Clay lode. This mine is on the mountain above the Golden Chest and is said to prospect high in gold.

**MINNIE MOORE.**—*Bellevue Herald*, Oct. 6: From the extra teams that are now hauling ore to the depot from across the river, one should surmise that just a little stoping is being done in the Minnie Moore mine. Two or three extra wagons are busy, and hauling is kept up till 11 o'clock, an extra force going on at 3 every afternoon, and, as a consequence, five carloads of first-class ore per day will be shipped from now on. Five carloads amount to about 70 tons, and 70 tons at an average of \$120 per ton amounts to \$8400 per day, \$58,800 per week, \$252,000 per month, and \$3,942,000 a year.

**THE CAMAS NO. 2.**—*Wood River Times*, Oct. 2: The Camas No. 2 property, on the Gold Belt, continues to yield steadily, notwithstanding the many disadvantages resulting from lack of water, scarcity of fuel, etc. But the yield is small, as only about 5 of the 20 stamps of the mill can be operated at a time. Arrangements are, however, being made to secure a water supply, and when these are completed the yield will be quadrupled. During the month of July the Camas No. 2 yielded \$5000, in August \$3600, and during September \$3000—this at a comparatively light expense—which demonstrates that, if worked on a larger scale, the output would be eminently satisfactory. Experience has shown that, with a proper supply of water, a yield of \$50 per battery can be depended on—a total of \$200 per day at a cost of \$70 or \$75. But a larger number of stamps could be operated without proportionally increasing expenses.

**THE OLD BAR.**—*Wood River Times*, Oct. 6: Judge V. S. Anderson returned yesterday from Rocky Bar. He reports that place booming, with 500 to 600 inhabitants, nearly one-half of whom are employed, directly or indirectly, by the Alturas Gold Mining Company (Limited), the new English corporation which recently purchased the Ada Elmore, Confederate Star, Objective, Republic, and Great Eastern. This company, which is represented at the Bar by Captain Beckford Anthony, an energetic and capable mining engineer, has gone to work with a will, and already keeps two ten-stamp mills running steadily, while building another one, of 50 stamps, which will be ready to run by the 15th of November. The men who keep the mills supplied are only 14 in number, and they are only drifting in the vein and getting ready to stop when the big mill needs ore. The ore pays \$30 to \$40 under the stamps, and the tailings are worth a good deal more. Captain Anthony feels confident that he will soon show the biggest mining property in the Northwest. The Vishnu mine is looking finely, and Captain Settle is getting a 12-stamp mill ready to crush its ores.

## DAKOTA.

**THE RETRIEVER AND CAMBRIAN.**—*Black Hills Tribune*, Oct. 6: The developments on the Retriever and Cambrian are very satisfactory to the stockholders of those companies. The principal work on the Retriever is near its southern end, where a force of men is engaged in stripping the loose rock and soil from a large body of ore. A cut in the shape of an immense "T" is being excavated, and will serve to expose the chute for a distance of 100 feet along its length, while the extensions to the right and left will crosscut the ore. A large quantity of ore will be taken out by this development. To the north of this cut several shafts have been sunk to the ore and in some places have penetrated it. On the north end several cuts and shallow trenches develop a good-sized body of silver ore in a chute some distance to the east of the gold chute. Unquestionably there are two separate ore bodies on the Retriever—one carrying gold and the other silver. On the line of the Retriever and the Cambrian good float has been discovered on the northern end, and a force of workmen will go to work and uncover the ore body in a few days. This latter chute extends into the Cambrian ground. Enough work has not been done to determine positively, but the indications are that at this point the gold chute is separated into two ore bodies, lying along either side of a porphyry dike. Still further west are the principal Cambrian workings. A cut has been run into the hill from which two drifts have been started. A body of remarkably fine ore has been developed in these workings. In this cut an excellent example of the intimate relation of an ore body to a porphyry dike is afforded. The force of miners on the Cambrian is now working in a new cut and expects to soon uncover another chute of ore. The prospects of both of these properties are flattering. A large amount of ore is on the dumps and actually in sight in these mines, and it is all of a good grade, while some is surprisingly rich. The ore shipments will soon commence from the Retriever.

**DEER MOUNTAIN.**—George Monroe, who came down from Deer Mountain this morning, reports that encouraging developments are being made on the north side of the mountain. At last accounts the Iron Hill smelter was still in operation. A new strike is reported from the Monarch mine, Two Bit. The work on their ditches continues.

## NEW MEXICO.

**TERIBLE.**—*Black Range*, Oct. 6: The assessment work on the Terrible mining property, which adjoins the Adirondack, situated about one mile from town on Chloride creek, is showing up that property in an excellent manner. The Terrible has a shaft of 20 feet and the mineral extracted from the pay streak is bornite ore which is almost identical to that of the Silver Monument. This mineral is disseminated through the rock to a width of about 20 inches and of shipping quality, and improves in quality and quantity as work progresses. This new find is not only valuable within itself, but demonstrates that there lies within the hills which surround the town of Chloride, within a stone's throw, a vast amount of mineral, which, when opened up, will surprise those most sanguine in the belief that there are millions for those who seek it. Heretofore this character of mineral, which is excellent, has only been found near the head of the range and was verily believed

that it existed in no other section. Mr. Geo. Turner is the owner of the Terrible and the Adirondack properties, and it is the opinion of those who have a knowledge of mining that those properties, if developed properly, would prove excellent producers and would greatly revive the mining interests in this section. All we need to bring our camp to the front is capital.

**SOCORRO.**—*Bullion*, Oct. 10: Manager Bates is dumping excellent ore out of the Imperial. John Bell inaugurated work on the Chloride mine last Monday. Bob Stuart, of Pueblo district, returned from Albuquerque Saturday. Anthony Joseph spent over \$30,000 on one group of mines in Taos county. The Sulphuret mine is preparing to ship mineral immediately to Socorro for treatment. The Graphic smelter is having enlarged dust chambers constructed, as well as a 90-foot chimney. The Kelly, Graphic, Grayhound and Juanita are all in full operation, and shipping mineral to Socorro. H. F. Brittenstine is raising gold and silver mineral out of his Hetzgar and Dick Slider mines, of the Pueblo district. The Bonaparte, Sulphuret, Silver Gem, Ruby, Ida and McKenzie in Ruby camp are all being worked and showing up well. All reports from Hermosa are to the effect that the mineral output of that camp is gradually increasing. Hermosa ranks among the best camps in the Territory.

## OREGON.

**GRAVEL MINING.**—*Marshfield Coast Mail*, Oct. 6: Hutcheson, Burrows & Co. have opened a gold mine on the south fork of the Sixes river which promises to be one of the best ever struck in this section. At the point of their location the river runs through a gulch in the mountains, on one side of the river rock rise almost perpendicular close to the stream, and on the other there is a flat piece of bottom land varying in width from 399 to 1290 feet before the mountain is reached. It is evident that the old bed of the stream was on the other side of this level land, although now it is covered with some 60 feet of debris, and has large trees growing over it. A mine was located on the bank of the stream, as it now runs, some years ago, and \$3000 was taken out in about 200 feet. Attempts were made to tunnel to the old bed, but the operators could not make the scheme work on account of the water. The present owners have run a tunnel lower down and a few days ago struck the old bed of the stream. To do this they were compelled to go through about 200 feet of soil lying between the old and new channels. As soon as they thought they had found the old river-bed they sent for Bob Hutcheson, of Marshfield, who is familiar with gold mining in all its phases, and Bob went over to inspect the diggings and direct the work, and he was satisfied they had a splendid showing. Since then the boys have worked 11 days, Dave Hutcheson digging all the dirt and two others doing the washing, and they have cleaned up \$180. They estimate that the old bed, which they can work, is about 50 feet wide and extends up about 3000 feet. Persons who have experience in such matters and have looked the mine over are anxious to buy an interest, and the impression seems to be general that it is a very valuable mine.

## UTAH.

**REVIEW.**—*Salt Lake Tribune*, Oct. 8: The receipts of bullion (excluding all ore receipts) in this city for the nine months of the present year have been as follows: January, \$328,852.66; February, \$456,024.03; March, \$469,722.63; April, \$519,666.08; May, \$387,891.49; June, \$527,036.97; July, \$585,644.38; August, \$480,141.49; September, \$491,129.32; total, \$4,246,158.05. From the Ontario for the month of September the output was 68,439.29 ounces of fine bullion, and ore sales to the value of \$57,931.28, an approximate total value of \$120,370.51, a total for the nine months of the year of \$1,273,964.11. The Daily produced for September 41 bars of bullion, 55,829.42 fine ounces; ore sales for the month, \$10,889.03, an approximate total of \$66,718.45, or an aggregate for the present year to the 30th ult. of \$556,897.65. During the week ending Saturday, October 2d, inclusive, the shipments out from this city were as follows: 38 cars bullion, 884,836 lbs.; 3 cars ore, 85,100 lbs.; 13 cars copper ore, 339,136 lbs.; total, 54 cars, 1,309,136 lbs.

**IRON ORE.**—*Black Hills Tribune*, Oct. 2: Iron ore seems to be in great demand at the Iron Hill, but to find ore of the proper character seems difficult. Four bricks were brought in by Superintendent Millett from Iron Hill last evening. They weighed 3754.50 ounces. A long train loaded with Buxton ore went out last evening. We like to note this. It means prosperity for all. Fall in. There's transportation for tons and tons more. The Iron Hill has sent in over 26,000 ounces so far this month. Counting to day and to-morrow, and also considering what may have accumulated in the amalgamators, which latter will be cleaned up about the first, the output for the whole month should reach, if not exceed, 30,000 ounces, or something over \$28,000. It will be remembered that on the third of September 12 bars were brought in, which weighed 11,455 ounces.

**BEAVER COUNTY.**—*Cor. Salt Lake Tribune*, Oct. 8: The mining interests hereabouts continue to improve, and a number of new strikes are reported as follows: Hidden Treasure, North Star, a fine body of galena; Talisman, West Camp, a body of high-grade lead-silver ores; Wild Bill, a large body of lead ores, over 30 feet in width, high in lead but low in silver, with a good trace in gold. The Adelia mine in North Star has now attained a depth of 300 feet, with drifts 600 feet in length along the vein, which is continuous and shows here and there deposits of very high-grade silver-lead ores. A large cave has been struck in the Golden Era mine foot-hills at a depth of 200 feet, and lead ore, assaying as high as 129 ounces silver, has been extracted. This mine is now worked by Mike Powers, who is a half owner. The Rebel continues to yield now and then a carlot of heavy lead ores—Mike Monahan, lessee. Work still continues good on the Florence mine and Chicago, with Dan Dacey as boss. The Wild Bill and Flora mines, with Harry Melville as general manager, continue to improve, and large bodies of low-grade lead ores are now in sight. The next thing in order here is a smelter. J. M. Goodwin has been giving the camps a run over and left for the North with a box or two of fine specimens. The Star Mining Co. properties still continue to improve.

**STURTEVANT MILL.**

This Mill as a Crusher and Pulverizer is without rival.  
Is in operation in leading smelting works and mills.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

## Dewey & Co.'s Scientific Press Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

**Practical Treatise on Hydraulic Mining.**

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dumps; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey &amp; Co., Publishers, 252 Market St., San Francisco.

**PRIVATE  
DETECTIVE,**

Collector and Insurance Broker. The undersigned respectfully offers his services in any of the above capacities. Correspondence solicited. Address C. M. RICHARDSON, care "Fraternal Record," No. 252 Market St., San Francisco, Cal.

## Centrifugal Pumps and Draining Machinery.

[Written for the Press by J. RICHARDS.]

NUMBER 4.

## The Progress of the "Art."

It is perhaps in all cases unfair to indulge in censorious opinion respecting the past history and rise of an engineering manufacture or the development of a new class of machinery; but if there ever was a case where such opinion was justifiable, that of centrifugal pump development is such a case.

For more than half a century the pumps remained practically where they began. "The last was like unto the first," and during this period there was mistake, retrogression and a failure to discern simple elementary principles that surpasses present belief.

I am not in this view obtruding personal opinions upon others—I ask them only to compare the first American pumps of 1818 with those now made in this country, and by Gwynne, Allen, Drysdale and others in Europe at the present day. This is enough to show how little has been changed or improved; but it fails to in any degree indicate the practice that has intervened.

The dynamical laws or principles involved in the operation of centrifugal pumping present but little of the complicity attendant on heat engines, or in dealing with expansive gases. The problem is simple in comparison with the mathematics of projectiles, the philosophy of turbine water-wheels, or a dozen things that might be mentioned that have arisen and been disposed of during the time. It has been a development by experiment through mechanical expedients, a method always slow and uncertain—not wholly so, however, because in 1848 we find Mr. Whitelaw making computations involving all the principal conditions of centrifugal pumping. Still further on, however, we find the celebrated Mr. Rankin suggesting curves for the vanes of such pumps as bore a very remote relation to those since determined as correct for average heads.

The disk or inclosed wheel has been one of the stumbling-blocks over which nearly all pump-makers have made their way. Blake, Gwynne and Andrews, in America, and Bessemer, in England, all contributed to this mistaken method, and within the last three years the same old round has been gone over again by a firm in Massachusetts that adopted the Gwynne pump in other respects, but at first employed a Bessemer or Andrews runner. In a recent number of the *Engineer*, London, appears in an advertisement various sizes and adaptations of centrifugal pumps, all constructed with the disk runners. The writer and two other makers in California followed the same course, and, as before remarked, this thing has been stumbled over, at some time, by nearly all makers.

The causes for this are not difficult to trace. There has always been a desire, for commercial and other reasons, to employ a single inlet at one side of the pumps. This simplifies the construction, saves a great deal in first cost, makes the water-ducts more direct and free, and all parts more accessible. To accommodate this construction, seen in Mr. Gwynne's pump of 1850, there was difficulty in balancing the inclosed wheel—that is, compensating for the draught on the inlet side. Open vanes, like those in the Andrews pump of 1839, avoid the thrust; but such vanes, to be made of cast material, require a web or diaphragm to support them, and as soon as this was introduced the thrust became destructive, not only equaling the indraught or suction, but the whole area of the back of the disk or diaphragm became subject to a pressure equal to that in the discharge pipe.

This is a somewhat intricate problem and has, no doubt, puzzled a good many in their experiments with single inlet pumps. It can be explained in connection with Blake's pump of 1831, Fig. 2 of the drawings. The runner or wheel in this case was, to use a technical term, shrouded on one side. The vanes were attached to a plate or disk like an Andrews or Bessemer runner with one of the side plates removed. On the open or receiving side of the runner, there was no pressure at the center except from the impact of the entering water.

The pressure increases from the inlet to the periphery between the disk and the casing, but would not amount to more than a fourth of the pressure against the back which was exposed to the maximum pressure in the discharge pipe. This pressure on a disk of 24-inch diameter, working against a head of 20 feet, amounts to 3000 pounds or more, after deducting for counter pressure on the front or receiving side. This, as before remarked, was destructive, and to avoid it the wheels were inclosed on both sides, as shown in Fig. 6, reducing the unbalanced area to that of the inlet.

There is a recognition of this matter by Mr. J. S. Gwynne in 1850, and his ingenious attempt to balance the inclosed wheel by a vacuum or free space at the back. This is very complimentary to his engineering insight at the time, and it is a question now whether there is any true understanding among engineers of the function to be performed by the balancing chamber described in his patent of 1851. It seems to be a vacuum chamber to balance the draught

of the suction, but is, in fact, to protect that much of the area of the back of the runner from the pressure within the casing.

The water friction between the plates of a disk wheel and the stratum of water contained in the casing is the same as when the water is revolved in contact with the casing by an open wheel or runner, with the difference in favor of the latter method that there are no running joints to maintain around the inlets, and also that no "circulation" takes place.

This subject was discussed in a paper read before the British Association at Norwich, England, in 1868, by John and Henry Gwynne, and has, since that time at least, been a determined feature of their practice, and is also no more than a return to the principle of the Massachusetts and Andrews pumps of 40 years before.

The adoption of open wheels or runners forced the employment of a double or balanced suction, as the single inlet forced the employment of an inclosed or double disk runner. It was a cycle of experiment running over a period of 40 years and ending where it began, if we do not include the form of the vanes.

## Bonanza Steel.

The Anglo-Pacific Steel Company, recently incorporated in this city, has been organized for the purpose of constructing a forge and rolling mills for the manufacture of a superior class of steel known as "Hammond's bonanza steel." Mr. Henry Woodcroft-Hammond, is the president and manager of the company, and the directors comprise such well-known men as W. H. Taylor, of the Risdon Iron Works; James Spiers, of the Fulton Iron Works; J. F. Sims, of the Western Iron Works; Thomas Carter, of the Carter Car Works, Newark. Melville Attwood is the consulting metallurgist, and the Nevada Bank the bankers. The articles to be manufactured from ingots, blooms, billets and slabs of imported "Bonanza" steel will be those in most general demand and which have hitherto been largely brought from foreign markets, viz.: steel rails, bars, plates, sheets, ties, angles, building beams, steam and marine shafting, shoes and dies, chains and wire rope for mines and cable roads, and other like requirements demanded by the various engineering and mechanical industries of the coast. The company has secured an eligible location for its works, as well as the services of competent workmen.

Numerous iron ore deposits of various grades are known to exist on this coast in more or less quantities, but of the two superior qualities necessary for the production of steel, only one has hitherto been discovered, and this, without the close proximity of a suitable coal, prevents, for the present at least, the probability of its production here with any degree of success. The intention of the new company is to import the "Bonanza" brand of steel in its crude state at a minimum cost and then manufacture it here into forms and shapes necessary for the various established industries. When such works as these are in operation they will assist our manufacturing industries here to cope with Eastern manufacturers, inasmuch as their finished supplies have had to be imported from distant sources of production, subjecting them to heavy freights, and compelling them to keep considerable stocks on hand. The hoisting foreman of the Consolidated Virginia mine certifies to the fact that hoisting ropes supplied by Mr. Hammond stood a better test and lasted longer than others; and the superintendent of the Eureka Con. mine considers the "Bonanza" steel specially adapted for drilling purposes. Both the tool and machinery steel of this brand have been put to severe tests, which have proven satisfactory.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Young America (for September), \$37,500; Sierra Buttes (for September), \$27,000; Moulton, Oct. 9, \$12,800; Silver Odessa, 10, \$12,000; Oro Grande Mill, 10, \$5598; Hanauer, Oct. 5, \$7800; Crescent, 7, \$5600; Stormont, 8, \$4035; Hanauer, 8, \$2720; Overland, \$8, \$1100; Queen of the Hills, 8, \$1400; Alice, 9, \$38,943; Hanauer, 9, \$5800; Queen of the Hills, 9, \$1420; Overland, 9, \$980; Alice, 10, \$7261; Daly, 9, \$7622; Germania, 6, \$1869. The metal shipments out from Salt Lake City for the week ending October 9th, inclusive, were 18 cars of bullion, 456,837 pounds; 5 cars of ore, 258,900 pounds; 10 cars copper ore, 274,700 pounds; total, 33 cars, 990,437 pounds. The Salt Lake banks report the receipt for the week ending the 6th inst., inclusive, of \$86,428.83 in bullion and \$85,583.71 in ore, a total of \$172,012.54.

## MINING SHAREHOLDERS' DIRECTORY.

## The State Mining Bureau.

The State Mining Bureau recently received a piece of rock from the deepest point on the Comstock ledge, and the deepest of any mine in this country. It was from the Mexican winze, 3561 feet below the croppings of the Gould and Curry mine, which is the datum point for depth measurement. A microscopic examination by Melville Attwood proves this piece of rock to be granular diabase.

Among other recent additions to the mineral collection of the California State Mining Bureau are the following:

*Iron pyrites*, in beautiful crystals with octahedral crystals of gold, California, Louis Garnett.

*Wulfenite*, in very large crystals, Pima Co., Arizona.

*Colemanite*, San Bernardino Co., Cal., fine case of ores from Copper Queen mine, Bisbee, Arizona, Ben Williams.

*Desclozite*, San Pedro, Arizona, Chas. R. Wores.

*Caliche*, Tarapaca Chile crude nitrate of soda, Liceo de Valparaiso.

*Gold quartz*, showing free gold, Hard Tack mine, New River district, Trinity Co., Cal. Presented by Ladd & Clement.

*Gold in calcite*, Minersville, Trinity Co., Cal., from Hubert Vischer.

*Gold quartz*, from the Young America mine, Sierra Co., Cal. From the company. This is a large and characteristic specimen weighing about 150 pounds.

*Topaz*, weighing 5 pounds 6 ounces, from Japan.

*Roscoelite*—Rich specimens from the Sam Sims mine, El Dorado Co., Cal.

*Calaverite*—Rich specimens from Neale's mine, near Sonora, Tuolumne Co., Cal.

*Malachite*—Remarkable specimen from the Copper Queen mine, Arizona, showing fossil plants, Ben Williams.

## Mining Accidents.

John Gustine had one of his legs badly mashed in the mine at Pennsylvania district, Nev., the other day. While engaged at work, a slab of hard blue-clay that lies between the ore and wall, slipped down, falling on his legs, and severely bruising one of them.

John Calanan, of Cherokee, while at work in the Delhi mine, Nevada Co., met with a severe accident. He was sliding down the chute, when some one threw a bolt of lagging in the chute to send it into the mine. The timbers overtook Calanan, threw him out of the chute, breaking one of his arms and badly wrenching his back.

Henry Miller, working in the Gorilla mine, at Lundy, Mono Co., Cal., was instantly killed last week. It is the custom of the men employed at the mine to ride up on the tramway until they arrive at a certain station, when they get off. It seems that Miller failed to alight at the proper time, and his face and chin caught on the upper edge of the chute, nearly tearing the head from the body.

A miner named Childs fell 125 feet, down the shaft of the Camas, No. 2, Idaho, and received fatal internal injuries.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

A NUMBER of Comstock mining men have spent \$100,000 and several years' time on the Centennial mine, Nevada Co., Cal., developing it. The new hoisting machinery is now ready to start up, and the owners expect to realize from the heart in the old blue lead.

## Mining Share Market.

The fact that the deepest workings on the Comstock are to be abandoned has exerted a decidedly bad influence on mining stocks. Many operators are of the opinion that this will be the deathblow to mining stock transactions here, as without the hopes of a possible Comstock bonanza there is nothing to create interest. The people at Virginia City are hopeful, notwithstanding the determination to stop deep mining. The *Enterprise* says:

"The upper levels of the Comstock at various points contain vast undeveloped resources of low-grade ore, which only within the last two or three years have been made available, keeping hundreds of men at work in both mines and mills, as well as keeping our local railroad much better employed than it would otherwise be, and sustaining a live, energetic, wide-awake community.

"The recently developed deposit of ore on the 600 level of the Savage mine, from which a shipment of bullion to the extent of nearly \$25,000 is about to be made, with others to follow, is a simple illustration of how similar deposits have been passed in the earlier workings in going after deeper and richer deposits. Several years ago, after the Chollar shaft and incline had been carried to the depth of 1400 feet, a deposit of ore was discovered higher up on the mountain-side than the top of the shaft, from which some millions of dollars were taken. This was known as the 'Belvidere body,' and extended from the level of D street upward about 200 feet, or up to Howard street and the sagebrush. These points are merely mentioned in illustration of the possibilities and resources remaining in the upper portion of the Comstock lode.

"The chief mining operators and men who control the heaviest interests of this section understand fully all this, and the real future of the Comstock, in illustration of which the Virginia and Gold Hill Water Company, as is already known, have been engaged for several months past remodeling their flumes and arranging to bring in an increased supply of water for mining and milling purposes, a large 12-inch pipe across the head of Washoe valley, in addition to those they already have, being a portion of the program, giving more than double the supply that we now have of the best water in the world, direct from the heart of the Sierra Nevada mountains."

## New York Metal Market.

Telegraphic advices dated Oct. 14th give the following New York prices:

BORAX—6 3/4 @ 7 1/4 c.  
BAR SILVER—97.50 per oz.  
COPPER-LAKE—\$11.11 1/2.  
IRON—No. 1, \$17 @ 18.00.  
LEAD—\$4.85 @ 4.95.  
QUICKSILVER—43 @ 43 1/2 c.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Firm, spot closing 11.00 @ 11.50c. Transferable Notices (Lake) issued at 11.25; Transferable Notices (Chili Bars) issued at 11.42.

LEAD—Dull at \$4.37 1/2 @ 4.45c spot. Transferable Notices issued at 4.40.

TIN—Active at \$22.20 @ 22.30. Transferable Notices issued at \$22.30.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.60 @ 22.90; Billiton Tin, \$23.00 @ 23.25; Banca Tin, \$23.00 @ 23.50; Baltimore Copper, \$9.75 @ 10.25; Orford Copper, \$10.25 @ 11.00; P. S. C. Copper, \$10.25 @ 11.00; Foreign Lead, \$4.70 @ 4.85; Foreign Spelter, \$4.70 @ 4.75.

MAKER'S PRICES—At tidewater. 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18.50 @ 19.00; No. 2, \$17.50 @ 18.00; Grey Forge, \$16.00 @ 16.25. Hudson River, Grade No. 1, \$18 @ 19.00; No. 2, \$17.50 @ 18.00; Grey Forge \$15.50 @ 16.00. Southern, Grade No. 1, \$18.00 @ 19.00; No. 2, \$17.00 @ 18.00; Grey Forge \$15 @ 16.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

NEVADA QUEEN M. CO., Oct. 11.—Capital stock, \$10,000,000. Directors—G. W. Grayson, John E. Doyle, G. C. Hickox, S. Roberts and James T. Cassell.

PORT COSTA LUMBER CO., Oct. 11.—Capital stock, \$600,000, in 6000 shares. Directors—W. J. Adams, Charles Hansen, C. S. Holmes, John A. Hooper, F. P. Hooper, C. A. Hooper, A. W. Jackson and C. F. A. Talbot.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
FRANK W. SMITH—Nevada and California.

O. F. BERGMAN—Tehama and Colusa Cos.  
S. S. LANYON—Nevada, Sierra and Plumas Cos.  
JEANNETTE HOUGHTON—San Mateo Co.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING OCT. 5, 1886.

350,181.—GREASE-TRAP—C. H. Ackerson, S. F.  
350,105.—VAGINAL SYRINGE—D. F. Bennett, S. F.  
350,242.—CARRYING VESSELS OVER OBSTRUCTIONS—W. A. Grondahl, Portland, Ogn.  
350,254.—WHEEL HUB—A. W. Lane, Janesville, Cal.  
350,205.—CLOD-CRUSHER, ETC.—D. Lubin, Sac., Cal.  
350,261.—ANIMAL TRAP—R. Matthai, S. F.  
350,390.—FURNITURE SUPPORT—C. M. Plum, S. F.  
350,446.—COMPOUND ENGINE—J. Richards, S. F.  
350,213.—DERRICK—Geo. Rounds, Vallejo, Cal.  
350,274.—CHAIR—Daniel Smith, Santa Rosa, Cal.  
350,470.—PILLOW-SHAM HOLDER—Souther & Taylor, Los Angeles, Cal.  
350,171.—SEPARATOR—A. Swingle, S. F.  
350,400.—REIN-HOLDER—L. S. Tambling, S. F.  
350,223.—PILE-DRIVER NIPPERS—H. v. d. Wulbecke, Arcata, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## DELINQUENT NOTICE.

Truckee Ice Company.—Location of principal place of business, San Francisco. Location of works, Martis Creek, Nevada county, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment (No. 1) levied on the 1st day of September, 1886, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	Shares.	Amount.
McAulay, F.	Not issued.	200	\$2000 00

And in accordance with law, and an order of the Board of Directors, made on the 1st day of September, 1886, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, in San Francisco, on Monday, the 25th day of October, 1886, at the hour of 1 o'clock p. m. of said day, to pay said Delinquent Assessment thereon together with costs of advertising and expenses of the sale.

GEO. W. SCOTT, Secretary.

OFFICE—202 Sansome St., room 4, San Francisco, Cal.

## DIVIDEND NOTICE.

OFFICE OF THE

Paradise Valley Mining Company  
San Francisco, California.

At a meeting of the Board of Directors of the above-named company, held September 29, 1886, Dividend No. 9, of Twenty Cents (20c.) per share, was declared, payable on Thursday, the 30th day of September, 1886, at the office of the company.

W. LETTIS OLIVER, Secretary.

OFFICE—No. 328 Montgomery Street, San Francisco, California.

American Exchange Hotel,  
SANSOME STREET.

Opposite Wells, Fargo & Co.'s Express, one door from Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

Board and Room, \$1.00, \$1.25 and \$1.50 PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

HERCULES SLAYING THE GIANTS.

## HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.  
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

GENERAL AGENTS,

309 & 311 Sansome St., San Francisco, Cal.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold  
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.  
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting  
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,  
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded  
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-  
ties to suit purchasers.

BALFOUR, GUTHRIE & CO.,

316 California St., San Francisco.

## FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 220 Fremont St.,

San Francisco.

MANUFACTURERS OF

BABCOCK & WILCOX BOILERS.

MARINE ENGINES AND BOILERS—  
Propeller Engines, either High Pressure  
or Compound, Stern or Side-wheel En-  
gines.

MINING MACHINERY—Hoisting En-  
gines and Works, Cages, Ore Buckets,  
Ore Cars, Pumping Engines and Pumps,  
Water Buckets, Pump Columns, Air Com-  
pressors, Air Receivers, Air Pipes.

MILL MACHINERY—Batteries for  
Dry or Wet Crushing, Amalgamating  
Pans, Settlers, Furnaces, Retorts, Con-  
centrators, Ore Feeders, Rock Breakers,  
Furnaces for Reducing Ores, Water Jack-  
ets, etc.

BABCOCK AND WILCOX BOILERS.

ICE AND REFRIGERATING MA-  
CHINERY.

MISCELLANEOUS MACHINERY—  
Flour Mill Machinery, Saw Mill Engines  
and Boilers, Dredging Machinery, Pow-  
der Mill Machinery, Water Wheels.

## ENGINES AND BOILERS

OF ALL KINDS,  
Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish  
Tanks for Salmon Canneries  
OF EVERY DESCRIPTION.

Boiler Repairs promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines, Babcock and Wilcox Boilers,  
Tustin Ore Pulverizers.

DEANE STEAM PUMP.

**RANKIN, BRAYTON & CO.,**  
BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street.  
Chicago: 100 N. Clinton.  
New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

#### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

#### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## The Mining Industry in California.

While it must be admitted that mining has, through the extensive growing of the cereal crops, been relegated to a secondary place in the industries of California, it is, nevertheless, the case that the production of the precious metals remains here a very important business. Not only so, but it is a business which, instead of having fallen into a state of hopeless decadence, as many suppose, is really in a very thrifty condition. It is, even at this time, growing quite rapidly—the product of gold and silver in this State having, for several years past, increased at the rate of a million or more annually, the total amounting now to something like \$19,000,000. And this increment is bound to be maintained for some time to come—the prospect being that it will, for the next decade, be somewhat accelerated.

While it is not anticipated that the yield of gold will be restored to what it was in pioneer times, there is good reason for believing that it will amount, in the course of the next 10 years, to very nearly half as much as was ever taken out in any one year—say \$30,000,000, at the least, and that something like that sum will, for an indefinite period thereafter, be maintained. The permanent, if not the more immediately productive, sources of our mineral wealth lie in our quartz lodes, which we are now only beginning to work in a large and effective way. That this branch of the business is capable of great enlargement, no one can doubt; within certain limits its expansion may, in fact, be said to depend on the amount of capital employed to that end. Under more thorough exploration, the field of practical operations is every year growing wider and wider, new deposits and new districts being discovered on every hand. Our main mineral belt, extending for a distance of 800 miles, is studied now with mining camps from one end to the other. If, among these, some are dead or decaying camps, they are not the centers of quartz operations, but of placer mining, much of which was necessarily of a temporary kind.

While there are instances in which quartz deposits have been abandoned because they had been worked out or failed to pay, not a case can be cited in which an entire district devoted to quartz mining has been permanently vacated or in which active operations have been wholly suspended. Meadow Lake, which comes the nearest to fulfilling these conditions, having been in a moribund state for many years, is again showing signs of life. The district is not dead; it was merely a case of suspended animation.

The vitality, as well as the vigor, of this class of mines is well illustrated by the case of Grass Valley, where quartz mining in California was inaugurated, and where, after having been prosecuted steadily for 35 years, the business is still being carried on largely and profitably, and with an outlook quite as encouraging as at any other point in the State. In French Gulch, a quartz-mining camp situated 250 miles to the north, the business, commenced in 1851, is flourishing to an extent unequalled in its past history and not excelled by any other locality in California. Look where we will, the oldest quartz-mining districts show themselves everywhere the best, evincing staying qualities that ought to commend the business to parties disposed to invest in mining properties of any kind.

## The Lick Telescope Object-Glass.

There were 19 failures in casting the lens of the Lick telescope before a glass was procured which was fit to be polished. At last, however, one that was satisfactory was cast and sent to Alvan Clark & Sons, of Cambridgeport, Mass., to be polished. It is now announced that the glass is completed and is ready for delivery. Prof. Newcombe, of the Washington

Fig. 1.—PLAN OF GLOBE MINE, ARIZONA.

Naval Observatory, has been selected as expert to report on the perfectness of the glass. It is scarcely probable, however, that fault will be found with the Clarks' work, they being the most expert people in the world in this line. The elder Clark, now a very old man, regards the glass as the consummation of his life-work,

## Copper Mines of Globe District, Arizona.

The copper bullion produced in Globe district, Arizona, which has made the Old Dominion Company one of the largest producers in the Southwest, has been mined on the Globe and Globe ledge claims, near the town of Globe. They are situated on the crest of a hill forming a spur of the eastern slope of the canyon along

and can be cut with a knife. Where the great ore-body is found entirely in limestone, the latter is discolored near the ore, and appears to contain alumina, silica, iron, and a little copper, as in the Bisbee district.

The diorite found on the surface of the Globe claims is undoubtedly of eruptive origin. It disappears below the overlying lime and sandstones a little to the north of the outcrop of the vein on the old Globe ledge claim, and does not again reappear for over a mile on the strike. Where it does again appear, a contact vein of iron ore has been found. No large amount of copper has been discovered at this contact. Where ore has been found entirely in the diorite the ore has been a copper glance, and has given out in this district, as elsewhere, after inconsiderable developments have been made in depth. For the Globe mines, as for the others already described, the theory of a deposit has been set up; but this mine, like all the others, is held by the writer to be a true fissure vein. The Globe mine has been, perhaps, the most regular of all the veins described. Fig. 2 is a section. The limestone on the right dips less steeply than is indicated—about 15° only.

While the Longfellow can be likened to a series of lenticular bunches connected by thinner branches, and the Queen and Prince to huge chambers connected by thin strings, the Globe has more the nature of a great chimney, dipping almost parallel with the contact of the diorite and limestone, and having a pitch of about 45° S. On the immediate contact of the diorite and limestone, a small seam of ore is occasionally found, but it is not a profitable source of copper.

Mining in the old Globe mines is done by square sets, 12' x 12' timber being used. Owing to the almost continuous character of the great chimney of ore, expense for dead-work has been, in a large measure, avoided in this mine; and the cost of mining the ore is undoubtedly lower than at any of the others described above. In 1883 labor was worth \$4 per day, and 12' x 12' pine lumber was worth \$35 per thousand, delivered. Some 2000 tons of ore were mined per month; and the cost of the ore did not exceed \$5 per ton at the smelter, which is located directly below the mine at the foot of the hill.

As elsewhere in the great ore-bodies in limestone, some of the ore found is moderately silicious and some very basic; and mixtures of the different ores are made and smelted without any notable addition of flux. Occasionally, a little limestone or sand is added, if one or the other character of ore should prevail.

A PORTION of San Pablo bay is being surveyed by the Coast Survey. The Government is giving particular attention to the improvement of navigation on the Columbia river. The work of constructing a canal at the Cascades is still in progress, and it is impossible to tell when it will be finished. Another canal will be dug at some time, above The Dalles.

THE Soledad extension of the Southern Pacific is being rapidly pushed forward, and the graders are now within a mile of Paso Robles. The proximity of the heavy winter rains renders it absolutely necessary to complete all grading operations before they set in. It has now been decided that Paso Robles shall be the winter terminus of the road.

Fig. 2.—SECTION OF GLOBE MINE.

and has been extremely anxious to complete it while health and strength permitted him to pursue his labor. This object-glass is the largest ever made. It is 36 inches in diameter in the clear. The contract price was \$51,000. It is not probable that the glass will be brought to this coast before next spring.

Meantime work is going on at the observatory, Mount Hamilton, in completing the appliances. The large dome is being built by the Union Iron Works of this city, and the tube of the telescope is progressing also. Many of the appliances of this observatory are necessarily of original character in design and operation. The floor of the observatory soon will be operated by hydraulic power, and will be raised and covered to suit the observers' position at the eye-piece end of the tube.

THE September cleanup of the Young America mine of Sierra county was \$37,000.

proved to be such by numerous corals and fossil shells found in it; and the vein, which is undoubtedly a fissure crossing the limestone, is found near an upheaval of diorite. Near the face the diorite forms the footwall of the ore-body. Cutting the diorite and limestone is a trachyte dyke, having an east and west course. The exact location of this dyke is shown in Fig. 1. On the surface it covers a more considerable width, but underground it is found to narrow down to a dyke some 30 feet wide. These facts are from a paper by Arthur F. Wendt, read before the American Institute of Mining Engineers.

Approaching the great ore-body through the long adit-level run lengthwise the claim, conditions similar to those observed in the Longfellow mines of Clifton, and the Queen and Prince mines of Bisbee, are found to obtain. The rock becomes kaolinized, especially near the contact of the diorite and limestone. The kaolinized rock is extremely soft, has an unctuous touch,

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ems.

## Cooke City, Montana.

[From our Traveling Correspondent, R. G. HUSTON.]

Some months ago I gave you a short letter from data furnished me by an acquaintance from this district, and on again canvassing the Territory, having a great desire to make a tour of the National Park, and that trip bringing me within 60 miles of Cooke, I included that place in my travel. The Clark's fork mines have been known for some 15 years, prospectors and hunters having located some claims here that long ago; but the rugged mountains and difficulty attendant on getting in and out deterred all of them from a permanent residence here. Moreover, hostile Indians were swarming over the fine hunting-grounds here at that time. Buffalo, elk, deer and antelope were here in abundance, and, in fact, elk and deer are here yet in large numbers, and a large portion of fresh meat consumed by the community is wild game.

The mines are in the extreme southeastern corner of Gallatin county, and the prospects that are most developed are on the spur of mountains lying between Soda Butte creek and Stillwater, on mountains named respectively Miller, Henderson, Fisher and Sheep. On the south side of Soda Butte creek is Republic mountain, on which is the Great Republic mine.

To return to the gradual opening of this camp, after the first discovery in 1871, nearly every year some new party would find their way in here and relocate the different claims, stay a short time and then seek a more congenial clime, intending at some period in the dim, misty future to return and develop a Comstock for themselves. All this time the whole of that portion of the Territory lay in the Crow Indian reservation. In 1877 a company was organized in Bozeman, and a smelter was built here—one of the old-fashioned Mexican stone furnaces. They had just started it when the Nez Percés war broke out. Everybody was driven out and everything that was combustible was burnt to the ground, so that, for nearly five years, nothing more was heard from the Clark's fork mines. In 1882, after the treaty with the Crow Indians had been ratified and this portion of their lands thrown open for settlement, the first permanent locations were made, and since that time, like all isolated quartz camps, it has been slowly coming to the front.

## The Great Republic Mine

Was sold the same year by Messrs. Huston, Dawing and Woody, along with three other properties, for \$60,000, to some gentlemen from Cheyenne and Chicago, and a close corporation was organized. A water-jacket smelter was built during the season of 1883 of a 50-ton capacity. This has been in operation ever since, except such a portion of the time as they were unable to keep up their coke supply. This has all to be transported about 70 miles in wagons over the roughest mountain road a man ever saw. To give an idea of how bad it is, it may be stated that some 20 miles out on the road up from the Mammoth Springs I met a number of large ox-teams that had then been 19 days on this 140-mile trip, and it would at least take three more days, or 22 days in all—a long time to make the distance. The only conceivable reason for this road being so bad is that the most of it lies from three to five miles within the National Park, and the authorities in charge will neither build a road nor allow the citizens of Cooke to improve it for themselves. This is another case where consistency is a rare jewel. To an unbiased outside mind the real way to benefit the 800 American citizens who are here located with the idea of bettering their condition in life would be to grant the right of way to the Cinnabar branch of the Northern Pacific and permit them to extend their road to Cooke. This would give them a chance to open up their mines and get their bullion product out without the immense tax it has now to stand.

The Republic Company run for the most part on ore from their own mine. They use some custom ore for fluxing, there being some in the camp that mixes to a good advantage with theirs. The Republic Company have a bond on the Homestake mine for \$100,000, six months to run, subject to a test up to 50 tons of ore. This is the most extensive surface showing in the camp, and I might say, without fear of contradiction, the greatest surface showing in the country anywhere, for it is really a mountain of ore.

The developments on the mine have not been properly managed to make the showing that mining experts wish to see when passing their opinion regarding the continuity of the property; yet there are thousands of tons of ore in sight, and probably fully as much patent to the observation as would be in a smaller deposit confined between wall rock.

The mine was discovered and located by Sam Mather, Geo. Smith and some others, although these are the only ones of the original locators now interested. Many assays have been made from this property and the general average runs from 50 to 100 ounces silver, \$20 gold and from 10 to 20 per cent copper. This does not include assays made from selected ore, as a number of these have been made that run very high

in the aggregate. The altitude of this mine is over 11,000 feet above the level of the sea. It will be another capital point for a Huson tramway, similar to the one used by the Helena Mining & Reduction Co., to convey their concentrates from Comet to Wickes. It is quite a long distance above the timber line on the mountain, and it will take as much capital to make a good wagon road to the mine as it will require to build the tramway, and that would very materially lessen the cost of transporting the ore to the reduction works.

## The Daisy

Is a very similar location, a short distance south of the Homestake, and has nearly as large a quantity of ore. It is owned by Messrs. Kearns & Brownser. It carries more gold than the Homestake, but not so much silver, making the general aggregate about the same. Nature has certainly favored the discoverers of these two properties very much by placing immense quantities of ore in plain open sight, and the only way that any further development would be satisfactory would be to take away the ore in sight and treat it, and thus clear the way to see what is below the outside showing. A number of the oldest and best mines in the country are in lime formation, and this about explodes the old theory that mines in lime were not lasting.

## The New Year's Call

Is located south of these other mines, and but little has been done here. It is owned by John Tate & Zed. Daniels, and is on the top of Henderson mountain—rather a lofty place for a New Year's call, I should say, but as it carries plenty of free gold it is likely to develop into a fine property, and it is my earnest wish that it may, as Tate is one of my friends of the old placer-mining days of Montana, and is deserving of all the good luck that may befall him.

## Bull of the Woods

Is located half a mile to the north of the Homestake, on the backbone of the low divide lying between Henderson mountain and Fisher mountain. It is owned by Mather, Bowen & Smith, and carries enough silver, gold and copper to make it a fairly profitable ore to work when facilities are sufficiently advanced. As the camp now stands, it requires about \$100 to pay expenses, and it takes pretty rich ore to do that.

## The Young America

Is located on the west side of Henderson mountain and well up to the top. It is owned by Frank Essler, who has done considerable development work, running a tunnel in some 200 feet, and has a fair body of ore. In running this tunnel he crossed two small bodies of ore running at right angles with the main ledge. Each of these prospecting well, and he thinks he has a good property. Mr. Essler also owns the Big Blue lead over on Miller mountain. He is working quite a force here and is selling his ore to the Republic Co. It is a heavy black galena ore and carries some silver. There are also some sand carbonates and rather an easy deposit to work, the main trouble being to keep it lagged tight enough to prevent it from pouring through and running to the surface.

## The Elkhorn Mine

Is a location on Fisher mountain, northeast of Henderson, and is owned by Geo. Fisher, who, by the way, was our only subscriber in the place when I arrived here. His mine is developed by a tunnel run in on the lead for 75 feet, and a shaft in the head of the tunnel 50 feet in depth. This is a heavy galena ore and carries about 100 ounces silver and from 50 per cent to 60 per cent lead. What ore he has taken out in his development work he sold to the Republic Co. This also lies up close to the top of the mountain and is quite inconvenient to get at.

The Black Warrior is another of the finest properties in Cooke, and is really the best developed property on the Miller mountain. They have a shaft down 60 feet, and 50 feet of levels run from the bottom of shaft. Then they have a tunnel run in from below and an air connection tapped through, and are now shaping up their tunnel for stoping out. They will then have their mine in shape to take out ore as fast as they may need it.

Some of the finest assays ever obtained in the Territory were here in a small strata on the top of the ore body, running as high as \$29,000 per ton, gold and brittle silver. The general average of this immense body is 50 per cent silver. This property is owned by Gassert, Black & Randal. They have had the old Bozeman Company smelter leased—the one built in 1877, and spoken of before in this letter, and have been operating this all the season. Just at the present time it is shut down for the purpose of effecting arrangements with the company for putting in one of the improved water-jacket furnaces. If this is done the production of Cooke will be very materially increased.

These are the same parties who have been operating the Shoo Fly mine under a bond and lease for \$21,000. This property was owned by Horn, Miller, Pike, Moore, and Maj. Pease. This is a fine silver property and carries a large percentage of lead, as in fact all the properties on Miller mountain do. The general impression is that they have already made money enough out of the mine to pay for it. That is, of course, gossip, and cannot be depended upon. The Little Judge is a short distance below the Shoo Fly, and carries \$20 in gold and some silver, and a small percentage of lead. This is owned by Messrs. Sanborn & Roberts. It is a promising prospect and is rather conveniently located, which is a miracle in these mines.

## The Stillwater

Is located in Wolverine Pass at the headwaters of Stillwater creek. It is owned by Dewing, Bowen & Fleming. The only development on this property is a shaft about 50 feet in depth. A short time since they sold to the Republic Co. nine tons of ore from this shaft, receiving therefor \$125 per ton, and certainly that is a good grade of ore and well worthy of further development. If its proprietors are too rich to do this themselves, it will pay for hired help in this same section. There are numerous other locations, but as they are nothing more than prospect holes of uncertain dimensions and a stake and notice, I will have to defer mention until a more convenient season, and, at least, until their proprietors have played their picks and shovels to advantage.

## The White Warrior

Is located on Sheep mountain. This is on the east side of Clark's fork proper, and is owned by Collins, Howell & Co. It is developed by a tunnel in some 200 feet. The ledge has widened from a seam to start with, until it is now near four feet in width, and has the appearance of a well-defined fissure vein. This is in the granite formation and assays have been obtained here as high as \$400 per ton gold. It carries a small amount in silver. This is a very favorable-looking prospect, and will soon be more thoroughly investigated by its owners. All the prospects obtained on this mountain in the granite formation have been gold properties, and as those are attracting the most attention, it will make them more attractive to prospectors than heretofore. On the east side of Miller mountain there are quite a number of locations, and more or less work done, according to the will or the depth of the owner's pocket.

The Washington is owned by Messrs. Tate & Black. On this a tunnel is in for some distance, and its close proximity to the Black Warrior makes it a desirable property to hold fast and await developments. On this same location is a fine bed of fire-clay, which may at some time be a valuable property itself, totally dependent on the development of the general interests in the vicinity.

Then there is the Tate mine. In this a tunnel has been run over 100 feet to strike the ore body at a depth of over 100 feet, but they were driven out by water when the snow was melting last spring, and have never commenced work on it again. This is owned by Tate, Mather & Fuller. They are intending to drive the tunnel in some 50 feet more very soon, and have strong hopes of striking an ore body. The Morning Star is a short distance below, and some work has been done here, but not enough to be satisfactory either way.

The Iceberg is another location, "one-third of which sold a few days ago for \$700. But little development has been done here yet. It is simply a prospect, and a fair one, too, but that is all that you can say for such claims where no work has been done to show up the value of the property.

The product of the Republic smelter, when running steadily, is from four to five tons of bullion per day, and the fact that the smelter continues to run is patent enough to any one with ordinary understanding that, notwithstanding the enormous freight bills they must pay on supplies in and bullion out, it is a paying investment.

Now, as to the mode of reaching Cooke, there is but one way of getting there. That is to take the Northern Pacific to the end of the Cinnabar branch and then stage it for 70 miles. J. A. Clarke, of the Mammoth Hot Springs, runs a stage-line and carries the mail in twice a week and such passengers as wish to go back and forth. Clarke is a thorough-going stage man and he always gets there on time, one and a half days' time from the Springs.

The town itself is scattered over considerable ground and is more of a burgh than I expected to find. The Cosmopolitan hotel is kept by J. P. Allen, and the wants of the inner man are carefully attended to here. The accommodations, while not elaborate, are comfortable, and that is all any sensible person will require in a new mining camp. There are two restaurants, another hotel, livery stable, one book and stationery and notions store, and barber shop. There is a hardware store and three general supply stores, and another about to open, and that will be ample for this season. By another season there will be an opening for more. A livery stable, butcher shop and barber shop about complete the Cooke business directory.

As both the smelters are within a stone's throw of town, it is very convenient for the hands to board at the different hotels and restaurants. I saw no Chinamen in the town, and presume they are barred out, as they are usually among the first in an outside camp like this, and there surely must be a reason for their absence in this case.

The trustees of Cooke City district are just having the finishing touches put on a very comfortable schoolhouse, and are thus showing their appreciation of the educational privileges accorded us as free American citizens.

In nearly every house one enters here you will see from two to half a dozen pairs of snowshoes carefully laid away for a time of need. Indeed it is about their only means of locomotion at times in the winter when the snow falls deep. I think from the way they converse about it they rather enjoy the life, yet I have no particular desire to spend a winter in there, although if a man were steadily employed on a mine, for instance, he would not notice the weather much.

## The Hunt Placer Mines.

Mr. C. L. Hunt, son of J. S. Hunt, manager of the Hunt mines, Snake river, 18 miles from Bliss, on the Oregon Short Line, is visiting Boise City, and gave the *Statesman* a friendly call and a description of the celebrated Hunt placer mines, the finest as well as the largest flour gold placer mines in Idaho, if not in the country. The claims lie on the Alturas county side of Snake river, two and a half miles below the Salmon Falls. The entire claim, sloping westward and fronting the river for the distance of about one and one-fourth miles, consists of 148 acres patented land, which is the only patented placer claim in Alturas county. In addition to this there is about 200 acres of good mining ground held under location, which shows "colors" from the surface down; besides this there is also about 120 acres that is valuable for dumping ground and for placer machines. The gravel of the claim is fine, none of it being larger than a goose egg. No boulders have been found to interfere with the mining, except in one small corner, next the U. S. mineral monument. The Burlap system is used—five machines with grizzly plates, 4x24 feet, and with six burlap boxes each, 3x24 feet. Only three machines are used at present. An abundance of water for any number of machines can be obtained by enlarging the present ditch, about 200 inches of water being necessary to the machine. There is room on the river front to put in some five more machines. Where the ditch now comes on to the claim it is an elevation of some 30 feet above any other point on the claim, and being easily conducted by surface ditches to any point desired, no pipes are used for washing the ground the first time; pipes will be used, however, in cleaning off the bedrock. The gravel has been found to be of much greater depth than was at first supposed when the claim was opened, having been worked down in some places to the depth of 25 feet, with no sign of bedrock appearing. Some of the pits have been worked back 600 feet, and the gold found is as fine as flour. The ground that has been worked has paid at the rate of five cents to the cubic yard, from 300 to 350 cubic yards being washed by each machine every 24 hours. The average production of each machine per month during the past year has been \$350. The quality of the gold is very high, running about 945 1000 fine. The number of men employed is as follows: One on the ditch, one in the pits of each machine, one making ditches, one with the team, and another to rock up the concentrates. During the past three winters there has not been a single cleanup missed on account of cold weather. In the winter of 1885-6 the coldest was five degrees above zero and that only three or four mornings. Each machine is cleaned up twice a week, except in very warm weather, when it is necessary to clean up three times. Two men will clean up a machine in two hours. The burlaps and concentrates are then hauled to the rockup shop, which is the only building on Snake river for that purpose, and rocked up.—*Boise (Idaho) Statesman*.

A PUMP FOR RIVER MINING.—Peter E. and Joseph G. Falcon, the submarine divers, have secured a patent on a pump for excavation and other purposes which is attracting considerable attention at the Exposition. Experiments thus far have proved successful, and loose matter of all kinds, even boulders, have been removed from river-beds at a depth of 10, 20 and 40 feet. The suction is so great that a \$20 gold piece laid flat on the river-bed has been raised, and the inventors claim that an 8-inch pump will do the work of 100 men, and a 12-inch pump that of 250 men. The fans permit anything to pass through them, owing to their flexibility. The pump is really centrifugal with flexible fans, and that is why the Messrs. Falcon were enabled to obtain a patent on it, as it is just as good for excavating as for any other purpose. Any solid matter can be removed by the patentees, who operate a steam jet in connection with the pump, and if this is not effective they can accomplish what they desire through the assistance of the submarine armor. Through their ingenuity they have effected what tunneling and other contrivances have endeavored to bring about, and they have received several letters from various sections of the United States and South America congratulating them on the results. They have experimented for four months and found the pump to work satisfactorily, and have overcome the obstacles heretofore encountered in the removal of the stones and other material from rivers, and they are now about to test the pump in California, on the spot where one of them, in 1851, picked up a 12-pound piece of gold.—*Chicago Times*.

THE Martin White Mining Co. has declared a dividend of 25 cents per share, payable immediately on the outstanding shares—about 2200. This company recently milled about 1100 tons of low-grade ore which had accumulated, and netted some \$15,000 therefrom. The balance of the fund in the treasury will be used for future prospecting operations.

THE long-contested mining suits of the Phoenix Mining Co. vs. S. F. Mack and Seymour vs. S. F. Mack, involving the title to a valuable group of mines in the Cave Creek district, has been finally decided against Mack. This ends the case, and will inaugurate a new era in mining circles at Phoenix, Arizona.

## California Names.

Many of the names of cities, towns, rivers, etc., of California are derived from Spanish and Indian words. The first Spanish settlers were Catholic missionaries; hence, the many sacred names. The male saints have "San," the females "Santa," preceding their Christian names. The missions were all named from saints or sacred dogmas. There are San Miguel, San Gabriel and San Rafael (from the three archangels, Michael, Gabriel and Raphael); San Juan Bautista and San Juan Capistrano (St. John the Baptist and St. John of Capistrano); San Luis Rey and San Luis Obispo (St. Louis the King and St. Louis the Bishop); San Fernando Rey (St. Ferdinand the King); Santa Cruz (the Holy Cross). Other Spanish sacred names, not derived from saints, are Trinidad (Trinity); Sacramento (Sacrament); Jesus Maria (Jesus, the son of Mary), etc.

The errors which Americans most frequently commit in pronouncing Spanish words are in giving to *a* the English sounds of *a* in fat and fate; giving to *s* the sound of *z*; to *j* and *g*, before *e* and *i*, the same sound in English; to *gu* the sounds of the English *w*, and on putting the accent on the first syllable—English fashion. The following, from Hittell, may serve as a guide to the proper pronunciation of some of the names. It is not a perfect guide to pronunciation, but only an approximation:

Diego—dee ay go.	Napa—aah pah.
Suisun—soo ee soon.	José—ho say.
Alameda—ah lah may da.	Jesus Maria—hay soos mah ree ah.
Sierra—see er ra.	Putá—poo tah.
Nevada—may vah dah.	Tejón—tay hóne.
Mateo—mah tay o.	Farallones—fah rahl yó nes.
Monterey—mon ta ray ee.	Gabriel—gah bree ále.
Luis Obispo—loo ess o bées po.	Rafael—rah fah ále.
Los Angeles—lohs áhn hel es.	Miguel—mee gále.
Vallejo—val yáy ho.	Pájaro—páh bah ro.
Vallecito—val yay thee to.	Coyote—co yó tay.
Joaquín—ho ah keen.	Pacheco—pah chay co.
Juan Bautista—hwahn bah oo técs tah.	Cahuilla—cah oo eel ya.
Tamalpais—tah mal pice.	Hueneme—way náy may.
Nietos—nee áy tos.	Dos Pueblos—dohs pwáy blós.

In the pronunciation of the names of Spanish and Indian origin, the letters usually have the Spanish sounds. The following from Hittell's Resources of California is a good guide. *A* is like *a* in far; *e* like *a* in fare; *i* like *ee* in meet; *o* like *o* in go; *u* like *oo* in fool. *H* is silent; *j* and *g* before *e* and *i* have a sound similar to that of the English *h*; *s* never has the sound of *z*, but is always like *s* in hiss; *qu* before *e* and *i* is like *k*. *Ll* is like *ll* in William; the Spanish, or with the circumflex over it, is like *ni* in union. There are no diphthongs in Spanish. Every vowel is sounded separately. Words ending in a vowel in the singular have the accent on the syllable next the last; those ending in a consonant on the last.

The following list of California names with their meanings will be of interest to visitors to the State, and by what has been said above, the pronunciations can readily be made. This is compiled from various sources:

Alameda—An avenue of elms or cottonwoods.  
Alcatraz—Pelican.  
Almaden—Arabic. The mine.  
Alvarado—The white road—a proper road.  
Alviso—The view.  
Anador—The lover.  
Alta California—Upper California.  
Agua Fria—Cold water.  
Agua Caliente—Hot water or warm spring.  
Alamo—Elm.  
Baja California—Lower California.  
Calaveras—Skulls.  
Calistoga—Cup and gown.  
Chico—Small.  
Colusa—An Indian name.  
Contra Costa—Opposite coast.  
Corral—Yard or pen.  
Coyote—A kind of wolf.  
Campo Seco—Dry field.  
Corte Madera—Place where wood is cut.  
Del Norte—Of the north.  
El Dorado—The golden land.  
Esperanza—Hope.  
Farallones—Rock islands in the sea.  
Fresno—Ash.  
Hornitos—Little oven.  
Lobos—Wolves.  
Loma Prieta—Dark mountain.  
Los Angeles—The angels.  
Laguna Seco—Dry lagoon.  
Los Gatos—The cats.  
Marin—Chief of the Tomalo Indians, of the sea.  
Mariposa—The butterfly.  
Merced—Mercy.  
Modoc—Strange or hostile Indians.  
Mount Diablo—Devil mountain.  
Monterey—The king's mountain.  
Monte—The mountain or forest.  
Montecito—Little mountain.  
Nevada—Snowy.  
Pah Utes—Utahs that live near the water (Indians).  
Pájaro—The bird.  
Pescadero—The fish.  
Placer—Gold diggings.  
Plumas—The feather.  
Potrero—Pasture grounds.  
Presidio—Garrison, fortress.  
Prieta—Black.  
Rincon—Place where two corners meet.  
Rio Vista—River view.  
Sacramento—Sacred mind.  
Salinas—Place of salt.  
San Andreas—St. Andrew.  
San Buenaventura—St. Good Ventura.  
San Diego—St. James.  
San Felipe—St. Philip.  
San Francisco—St. Francis.

San Joaquin—St. Joachim.  
San José—St. Joseph.  
San Lorenzo—St. Lawrence.  
San Luis Obispo—St. Louis the Bishop.  
San Mateo—St. Matthew.  
San Pablo—St. Paul.  
San Pedro—St. Peter.  
San Rafael—St. Raphael.  
Santa Clara—St. Clara.  
Santa Cruz—Holy Cross.  
Saratoga—Healing waters in a rock.  
Saucelito—Little willow.  
Shasta—Stone house or cave.  
Sierra—Saw, or mountain chain.  
Solano—The potato.  
Sonoma—Valley of the moon.  
Sonora—Harmonious sound.  
Tahoe—Big or deep water. Some say it means grasshopper.  
Tamalpais—Country of the Tamal Indians.  
Tejón—Badger.  
Temescal—Indian sweat-house.  
The Dalles—Stone spout for water.  
Tamales—A tribe of Indians. A kind of food.  
Tulare—The tule or rush.  
Tule—Rush of a plant.  
Utah—Mountain dwellers.  
Vacaville—Cow town.  
Vara—A measure about 33¾ inches.  
Vallejo—Big valley.  
Walla Walla—Away down.  
Yolo—Region of rushes and tules.  
Yosemite—Large grizzly bear.  
Yreka—Corruption of We-e-kah-white.

## Value of Mines.

The test of merit of a mine is its ability to yield a profit, when properly worked. The test of merit of a prospect is its ability to become a paying mine, when developed. Naturally, it is much more difficult to determine the value of a prospect than to determine the value of a mine. Still, there are rules which experience has taught are safe to follow, in estimating the chances for a prospect becoming a paying mine. The rules are altogether different in judging a fissure vein prospect from those which are, or should be, followed in judging a contact or bed deposit. The value of the latter depends largely upon development of surrounding claims, value of ore, size and direction which ore shoots are taking. What we commonly call a fissure vein, gets no value from its proximity to rich veins. Each vein is a "tub that stands upon its own bottom."

An enormous amount of labor is expended in working assessments on and developing veins which give not the least promise of ever becoming paying mines. It is impossible to generalize rules for judging prospects which are without exceptions, but experience has taught a few which can always be followed with safety, and from which no experienced miner will deviate.

The first rule is, that if it is not found on the surface, it is useless to dig for it. There never was a greater error than the commonly accepted opinion among prospectors that veins increase in richness as depth is gained, and that all that is required to make a mine is to sink to considerable depth. The instances in which richer ore is found at depth than on the surface are very rare. After shinning up and down a great many hundred prospect holes, and from the British possessions to the Caribbean sea, we can say that we never have seen a paying mine which did not have pay ore on the surface. The cases, too, are very rare in which the quantity of ore increased with depth. If, after prospecting the surface of a vein, pay ore is not found, it is a poor investment to continue work upon it.

The fissure vein prospect which has a value is the one which discloses ore of sufficient richness and in sufficient quantity to make a paying mine if it continues until the vein is developed to the point of economical production. The exceptional prospect, with exceptional value, is the one which is rich enough to pay for its own development. Of course there are other things besides those to be considered in determining values. The cost of working a vein, the character of the ore, the location, with reference to wood, water, roads and markets, are all important factors in determining values.

There is one thing that can be set down as a certainty, which is, that prospectors almost invariably place a value on their claim far in excess of any value they can possibly possess. Nine-tenths of the prospects in the country, judged by the rules here laid down, would be dear at the price of recording a deed. The sooner prospectors learn these things the better will be their chances of finding something salable and valuable.—*Denver Republican*.

A BIG COPPER MINE.—An Ottawa dispatch says: Canada has just hit upon a "bonanza" in the way of a copper mine. The Canadian American Copper Company has hit upon one of the most remarkable copper-bearing areas, it is said, in the world, at Sudbury Junction, on the Canadian Pacific. It is remarkable because the ore is so near the surface as to form practically little copper mountains, rising to a height of over 100 feet above the prevailing level and extending in a broken range for nearly eight miles. The Canadian Pacific Railway has constructed a siding from the Algona line, and within the last four days between 30 and 40 cars, containing an aggregate of some 500 to 600 tons of ore, have been sent to New York. Montreal capitalists, who have visited the mine, declare it is

the largest area in the world and with the highest percentage of pure copper that has ever been discovered. The mines are owned by Ohio capitalists, who have 120 men taking out 300 tons of ore daily, and the company is erecting 500 houses for the miners who will be added to the present force when the dwellings are completed.

## The Life of a Miner.

It is seldom that so true a picture is found as is presented by the following from the *Eureka Sentinel*: "To those who know nothing more of mining than they gather from seeing ore hauled to mills and there witnessing the process it must necessarily pass through in order to obtain the precious contents, the miner's calling does not seem to be one that requires a high or even more than a commonplace order of intelligence; but this is a mistake. The perils that environ a miner at his daily tasks, and that are sometimes so subtle in their natures as to require nothing less than a scientific mind to combat them successfully, make it necessary and highly important that, so far as the work of mining is concerned, only men of skill, of clear heads and steady nerves and a fair knowledge of the work, should be engaged in it. There are some people who cannot realize a distinction between the miner and the laborer. The former, in order to fulfill the requirements of his calling, must possess considerable skill and knowledge of the requirements of the intricate work of drilling and blasting down the tons of rock and ore from their fastness of centuries, while muscle and endurance are sufficient for the latter. A knowledge, too, of timbering, lagging, etc., is imperatively necessary. This scribe can never meet one of these grim stained men passing down Poverty Gulch or over mountain trails on his way home from work, with heavy footsteps and jaded spirits, without feeling something of the thrill of happiness that he knows must greet him as he enters his little home where he left anxiety to take his place when he set out for his day's risk and toil. From the time the miner sets foot on the cage that whirls him down in 'hell of the deep, sunk mines' until he emerges again from his work, the specter Death is his constant companion, and his friends above ground do not know what moment they may hear the terrible news of his being crushed by a fall of rock or torn to fragments by one of those unexpected blasts, whose destructive powers no pen can adequately portray. There is a poem in the life of a miner which awaits the touch of some inspired writer who will give it adequate expression."

SODA LAKE DISTRICT.—Fred. W. Moore, of San Jose, a well-known mining man, early in 1885 conceived the idea of prospecting that portion of what is known as Soda Lake mining district, lying just below the south line of Death valley, in search of mineral wealth which, he was firmly impressed, could be found there. Mr. Moore organized and thoroughly equipped a gang of prospectors and accompanied them to that portion of the district. His hopes of the country were not doomed to disappointment, for the party had not worked a month when a rich vein of gold-bearing quartz was unearthed, samples of which assayed in value up into the hundreds per ton. By reason of several difficulties not to be overcome at that season of the year, Mr. Moore was obliged to leave his new discovery partially developed and seek civilization and financial aid to thoroughly develop the prospect. During his absence in the North he formed a company to work the property, and upon his return here yesterday, announced to an *Express* reporter that he would organize a company of miners and proceed to Soda Lake at once to place the mine in condition for extracting ore and milling it. Probably five or six men will be taken and employed in the work. Mr. Moore is a miner of experience and expressed himself as confident that the prospect would turn out to be one of the richest finds on the coast.—*Los Angeles Express*.

WILL IT PAY?—How shall a mine be judged? There are a number of people who are ready with answers, and there are a number of different answers, and each man giving one is altogether sure that his particular way is the best. There are men who judge every mine in granite as worthless, or at least too risky to touch. There are others who denounce contacts, others who would not have anything to do with a deposit in limestone, and still others who would not touch an ore deposit of any kind, believing that placer mining is the only real simon-pure, never-failing way of making money. Every well-posted man knows that there are good mines in each and every one of these classes against which there are strong prejudices. If a man, possessing some one of these prejudices, were to be called upon, as such men often are, to pass judgment on a mine in the despised class, how much would his opinion be likely to be worth? There is not much question but what the ultimate test to which all mines must be put is the simple one, "Will it pay?" If it will not pay, the next question is "What is the chance for making it pay, and what will be the probable cost of the same?" These questions seem simple and easy to determine correctly, but many a man knows to his sorrow that a correct answer is hard to get.—*Denver Tribune-Republican*.

## Pluck and Energy.

There are thousands of young men in this city and throughout the country who have passed through their school days and arrived at the point where they must throw off the dependence of youth and assume the helm of their own fortunes. It is one of the most eventful periods in human history. All depends on the way they start. Very few seem to think how much success hinges upon the spirit, pluck, energy and equipment of the individual at the outset. Five or six years will usually determine what sort of a destiny the maturer years of manhood will develop. Fortunate circumstances may place here and there one above the plane of toil and effort; but it is certain that 99 out of every 100 will have to work out their life problem. If a young man starts life in a mood of indifference, with low aims and ambitions, inclined to wait till he is married and settled in life before he puts forth any special effort, or to trust to luck, adventure or a prize sent to him from the wheel of fortune, he may for a season have a good time, but old age is almost certain to overtake him not far from the place where he started.

The first element of success is a proper equipment. "The winds and waves," says Gibbon, "are on the side of the ablest navigators," and it may be added that fortune favors the man who woos her knowledge. Take, for instance, the most unskilled labor of all, that of the tiller of the soil. It is his business to make the earth grow food; the elementary rules are very simple, the practice easy, yet between the worst agriculture and the best lie agricultural chemistry, the application of machinery, the law of the economy of force and some of the curious problems of physiology. But each point of science which the farmer acquires will not only make him a wiser but better tiller of the soil. The same fact is true of the whole catalogue of manual craftsmen—the blacksmith, carpenter, tailor, bricklayer, printer, or those who toil with hand and brain—doctors, lawyers, editors, reporters, engineers and preachers. Whoever would grow and thrive must become skilled in his particular art or vocation. This is no world for mopes and idlers. The young man who cares more for fine clothes than a knowledge of his business, more for cards, billiards, places of amusement than hard work and fidelity to his employer, may for awhile enjoy a sort of glow-worm glitter, but will always be a routine man, a drudge and an automaton in his work.

Then along with a good equipment, a young man must have pluck, courage, hope, faith and an intelligent appreciation of opportunities. Possessing these elements, he can hardly fail. His reward will be commensurate to his deserts. There may be exceptional cases, but they will generally be found not attributable to the man so much as to those contingencies that like tropical storms suddenly come and give no warning, and destroy the work of a life-time in an hour. But such squalls are rare. And then the plucky young man cannot be wrecked by any ordinary gale. He is equal to the emergencies. We learn from the *Santa Rosa Democrat* that two well-dressed young men recently passed through that place en route to Mendocino county, where they intended to take up and pre-empt a homestead. Through no fault of theirs, but owing to dull times, they had been discharged from lucrative positions in San Francisco, and after seeking employment for a few days concluded to strike out and make a situation. This kind of pluck is sure to win in the struggle of life. It is safe to predict that within a few years these young men will be independent and prosperous, while the great majority of those who hang about large towns and cities, content to be book-keepers and clerks, will be dependent upon the caprice of employers and as helpless as a fish out of water if thrown out of employment. And yet, we regret to say, but few young men of the present generation are amply endowed with this kind of pluck and energy. Many of them prefer to be dudes and ladies' poodles, counter-jumpers and lackeys in the city than strong, independent and valiant men in the country, and verily, they have their reward.

AMERICAN GLASS MANUFACTURE.—An American glass manufacturer, who recently visited the principal factories in Europe, says he is convinced that Pittsburg is ahead of all the European centers of the glass industry. The large sale of foreign window glass in this country he attributed not to higher quality, but to lower prices, due to the low wages paid in Europe. The plate glass made in this country, he says, is superior in quality to French plate, and when enough factories are built in this country French importations will cease. America, he says, is far ahead of France and Belgium in the manufacture of novelties, as regards ingenuity of design, labor-saving machinery and cheap production.

At the Alameda Co. salt works, out of 20 different firms, only three are employing white labor. About 350 Chinese are employed and only 25 white men. The Chinamen receive \$1 a day and board themselves, while white men are paid \$25 a month with board. The largest number of white men employed by a single proprietor is 15, while 100 Chinamen are at work for the largest employer of Chinese. All the salt produced is shipped to this point and is sold through the regular trade.

## Passing Events.

Silver continues to hold its advanced price, with prospects of going still higher. The slight advance in copper is also another encouraging feature to miners. This metal has been depressed for a long time, and those engaged in working it are in hopes to see a marked advance.

A proposition is made by English capitalists to establish tin plate works on this coast. This will be a new article of manufacture here. The large quantity of tin packages now used by our fruit and fish canneries would make ready sale for all the plate made.

Arizona appears to be on the eve of experiencing a revival in mining affairs. The settlement of the Indian question, so long pending, will encourage immigration, and now that protection to life and property is assured many languishing districts will revive. There are plenty of mines in the region that would have yielded largely long since if they had been properly worked.

Snow has already come in some of the more mountainous mining regions, putting a stop for the present to prospecting operations.

STEAM COALS are in free supply, but house coals are not overabundant. The Northern coast mines are shipping freely to this market. The shipments of coal from Puget Sound ports in September were 32,660 tons, valued at \$114,310.

## Cababa District, Arizona.

Cababa district is about 20 miles east of Quijotoa and 50 miles west of Tucson, or about 10 miles from the Mexican boundary line. It is one of the oldest districts in Arizona, having been worked by the Mexicans some years before the Comstock was discovered in Nevada. Many of the mines have even been patented, but have not been worked for a long time.

We had a conversation this week with D. M. Hyde, a miner who owns claims in the district, and who is about to return there. He states there is a good road to the district and that there are many good claims there. The reason of the long inactivity which has prevailed has been the fear of Indians. It has not always been safe for men to work there. Now, however, that the Indian question has been settled and the hostiles removed, claim-owners are going back there to develop their prospects, so good times are expected this winter.

Water is rather scarce, though there is enough for general use. It is supposed that by sinking plenty will be found for a mill. There is an abundance of wood. The climate is fine and there is never any snow. There are very few miners there now, though a number are going in this winter. The ledges are large and some of the ore is very rich. Specimens from several claims have been shown us. That from the Mountain Lion runs \$500 per ton in silver. The Grand View has turned out some ore assaying from \$700 to \$800. The Hard Cash goes \$20 in gold and \$150 in silver. The Hard Cash vein is eight feet wide, with good walls, and about three feet of it ore. None of these locations are at present more than prospects.

Our informant is very sanguine concerning the future prospects of that portion of Arizona, but says they need reduction works badly. The miners have been sending little parcels of ore to Denver and to Pueblo, Col. From New Mexican reduction works they claim not to get such good returns. The country is now perfectly safe to prospect and to work in. Capitalists need no longer fear to invest in mining property in that region. People have been naturally frightened at the presence of the Indians, but now they are gone, there is no excuse for not going to work and developing the mines.

## Volcanic Dust.

The State Mining Bureau and the California Academy of Sciences have both received samples of the dust, or ashes, ejected by the more active volcanoes of Pabloff, situated west of Pabloff bay, Alaska. This volcano has been more or less active for years—perhaps for centuries; but on the 12th of August last put forth all its strength about 6 A. M. and sent cinders and ashes a wondrous distance skyward. Some of these were collected, and sent here. Wm. Atwood, who examined the specimens sent to the Mining Bureau, states that there are indications of some magnetic substance.

Captain John Ross, of the schooner *Unga*, was fishing off Unga settlement on the morning of the eruption, and saw what appeared to be a fast-rising thunderstorm to the westward; this was the more remarkable inasmuch as thunder is very rare in that region. Yet it was so like an electric-laden mass that neither the captain nor his companions doubted for a moment its aerial character; and to further convince them they heard a continuous rumbling between 7 and 8 o'clock, with several loud roars resembling distant claps of thunder.

The mass was slowly moving eastward, and at nine o'clock it was over and around the vessel, darkening the sky considerably, and so thick that they could not see the land, though but a mile off the shore. They expected rain, but none came, and the air remained crisp and dry. For a time they were at a loss how to account for the phenomenon. After awhile, however, some of the men would blink and shake their heads, and assume a questioning mien; then another, and another, until all hands were winking and sneezing. Finally, some one discerned minute particles resembling emery on his clothing, and they discovered the character of the "dry rain."

The sky began to clear about 2 P. M., and in the evening the air was clear and the sky bright. From where they lay at anchor, the volcano was distant about 65 miles. The captain has heard that ashes fell to the eastward, off, and on Kodiak island, in plenty.

## Suspension of Deep Mining.

The Situation and Outlook on the Comstock Lode.

In the last issue of the MINING AND SCIENTIFIC PRESS it was stated that the Combination Company was then holding under advisement a proposition to stop the pumps and suspend further prospecting on the lower levels of their mines on the Comstock lode, this being the only company, with two or three exceptions, that for some time past has been prosecuting such explorations along the line of that lode. Having finally come to a conclusion on this point, the company proceeded, on the 16th inst., to shut down the hydraulic pumps stationed on the 2400-foot level of the Combination shaft, through the action of which pumps the several mines represented by this company were drained to a depth of 3200 feet, the powerful Cornish pump on the surface having also, meantime, been stopped. Within 36 hours after this was done the water had risen to the 2400-foot level, filling the entire lower workings of these mines, including several miles of drifts, crosscuts, etc. While the water will continue to rise yet another 400 feet, its upward progress will hereafter be less rapid, it having now reached above the points of greatest influx.

Since these proceedings were taken by the Combination Company the Gould & Curry and the Best & Belcher Companies have ordered the stoppage of work on the Osbiston shaft, being sunk by them jointly. Although there had occurred no perceptible increase of water in this shaft, it was considered unsafe to continue sinking at a depth of 2500 feet with a body of hot water 500 feet high standing above and in such close proximity to the workmen. Hence the shutting down of this shaft, from which all movable material of value has been taken out in anticipation of its filling up with water to the same level as in the mines of their neighbors adjoining on the south.

What is known as the Combination Company consists of a union of the Chollar, the Hale and Norcross and the Savage Companies formed several years since for the purpose of putting down a deep drain shaft at their joint expense and for their joint benefit, the expense of keeping the pumps running in this shaft after it had been sunk having also been defrayed by these three companies jointly. The reason assigned by the former two companies for shutting down these pumps is that the Savage Company had declined to pay their quota of the expense required for keeping them going. Whether such declension was based on a lack of confidence in the outlook or a lack of funds we are not advised. Through the course adopted by the different companies mentioned there ensues an almost entire suspension of deep prospecting on the Comstock lode, nearly all of the other leading companies along it having heretofore given up this line of exploration, some of them several years since.

Such being the case, we are naturally led to inquire whether this movement means a final abandonment of deep workings on the great Washoe lode, as many incline to think, or whether such workings, more satisfactory arrangements between the several companies having been effected and conditions generally become more auspicious, are likely to be resumed, as an almost equal number of persons affect to believe. The truth is, opinion on this subject is much divided, the trustees and others officially connected with the companies most concerned appearing to take a less hopeful view of the future than is taken by the general public. These officials tell us that the shafts and other exploratory works in some of these mines approximate now a vertical depth of 3500 feet, the depth reached in several others exceeding 3000 feet. They tell us that for the last 1700 feet hardly any pay ore has been encountered, nor are the prospects in the lowest workings opened up at all encouraging, the little ore found there being of low grade and much scattered. Owing to the great depths reached and the steadily increasing quantity of water encountered, the cost of further sinking will be heavy, as will also be the cost of raising the ore, should they meet with any large bodies of it. Then, to pump out and rehabilitate these lower levels, after having allowed them to fill up with water, will be no easy matter, as the timbers, swelling, will be more or less warped and, perhaps, thrown out of place altogether, while the

ground, rendered soft and soggy, will be liable to cave, not to mention much other injury from this condition of things likely to ensue. They find some of the companies little inclined, if not averse, to contributing further toward the expense of pumping, while shareholders are so tired of paying assessments that the trustees cannot hope to much longer raise funds from this source to go on with; the foregoing aggregating a sum total of difficulties and discouragements that they fear will prove insurmountable.

Admitting the truth of what is here said about the difficulties to be encountered, there are those who incline to the opinion that deep sinking on the Comstock will again go on, adding in support of this view the fact that the companies, while discontinuing pumping, have failed to remove their pumps from the lower levels. Leaving these machines in place is construed to mean that these companies contemplate having use for them in the future, it being further argued that the bringing in of an additional supply of water can have no other end in view than its application to these hydraulic pumps. Some few there are who affect to think that this "shutting-down movement" is designed to alarm holders and thereby cause them to throw their shares on the market or let them be sold for assessments. As this class of stocks have not sensibly depreciated of late, there does not seem to be much weight in this argument. Shares in the Combination Companies appear to be widely distributed and held rather firmly.

There is a chance, too, that some of our Comstock barons may have a pride to sink a few hundred feet further on the great lode, and thus gain for the workings here the distinction of being the deepest of any vein mines in the world.

Again, some encouragement to persist in going down may be gained by consulting the history of the various *Veta Madres* of Mexico and other old mining countries, and from which it appears that the pay ores in these masterly lodes have never been entirely bottomed. Under the workings of centuries the ore in these mines has become so impoverished or reduced in quantity as to lead to their repeated abandonment; but they have as often been again resuscitated, and are nearly all being profitably worked to-day.

Both experience and science assign to these great ore channels an imperishable life. They are apt to go down preserving their proportions and carrying their ores through the sedimentary, the metamorphic and the primitive rocks, down probably clean through the outer crust of the earth. The Comstock lode is marked by all the features of fertility and permanence characteristic of the most powerful veins of other countries. Standing for the first thousand feet or more between the syenitic underlie of Mount Davidson and the Andesite country to the east, it takes at last, according to Prof. Becker, to the syenite altogether, cleaving it to indefinite and unknown depths.

The Comstock vein carries a true silver ore, noted for its purity and staying qualities. As is the case in the ancient and long-worked mines of Mexico and Peru, the ore here contains but little copper, lead, zinc or other base metal, nor does the percentage of these increase with depth, a feature by geologists considered favorable to the continued fertility of the veins that carry them; and, finally, should matters on the Comstock come to the worst, should this cessation of pumping result in the filling up and the absolute abandonment of the lower workings of the lode, there remains still ore enough above the 2000-foot level to keep all the mills in the vicinity profitably employed for many years to come. Not only so, but it is believed, by those most competent to judge, that there is enough ore of that kind to keep a considerable number of additional mills so employed, parties proceeding on this assumption having already adopted measures for largely increasing the ore-crushing capacity of the district. It is for this purpose, it is said, rather than for furnishing motive power for driving the hydraulic pumps placed in the deep, that the Virginia and Gold Hill Company is bringing in an additional water supply. Arrangements have, in fact, already been made by this company to furnish water for driving the stamps in a series of mills to be put up along Six-mile canyon, and at such intervals apart that this water, owing to the steep grade of the canyon, can be used many times

over, and under a head varying from 75 to 100 feet in each case.

In withdrawing their men from the lower levels, the several companies have already set some of them to work in the upper portions of the mines, extracting the ore there left behind in the days of bonanza; and it is expected that many more will in good time be put to work there. Should this come to pass it may yet turn out that the era of bonanza, with its more moderate but more steady and certain returns, will prove to the community at large, if not to the shareholders in these mines, more beneficial than the era of bonanza, with its fluctuations, excitements and anxieties, always so endangering and often so damaging to a great variety of interests. What most concerns the business public, and more especially the inhabitants of Virginia City and Gold Hill and other communities, more or less dependent on the output of these mines, is that the latter yield pay ore enough to keep a large labor force constantly employed. This, by reason of the expenditures required, will benefit these communities almost as much as if the mines were making for the shareholders the large net earnings of former years.

Whichever way we view it, the situation on the Comstock is by no means desperate, nor is the outlook such as should fill the resident inhabitants with alarm. That the towns in the vicinity of the great mother lode will be able to exist, and even hold their own, seems probable. That large requirements for machinery will continue and a large consumption of lumber, fuel and other supplies go on, is pretty certain. There will still be extensive demand for the products of the farmer, the stock-raiser and the lumberman. There will be, as always before, much work for the teamster, the wood-chopper and the charcoal-burner—in fact, employment for multitudes of men, though, perhaps, at wages slightly less than were formerly paid. Should, however, this be so, any reductions made will be fully offset by the lessened cost of living.

#### Mining Accidents.

On Saturday last Wm. Seavey was killed in the Pilgrim mine, Sierra county, by being struck on the head with a stick while removing wood from the bottom of a chute.

John Judge was killed in the Daly shaft, near Park City, last week. John Judge and James O'Connell were coming up on the cage from the 700-foot level on which stood a car containing several drills. As the cage went past the 700-foot level it suddenly stopped, as if it had caught on something, and the car was completely smashed. John Judge was caught between the cage and shaft, and, as supposed, instantly killed. From an examination after the accident it is supposed a drill, catching in the shaft, threw the car out of gear with Judge in it. O'Connell was hurt slightly about the leg.

Last Thursday, while a number of laborers were engaged in taking down the framework of the old Con. Virginia mill, at Virginia City, one man was killed and another seriously injured. Williams and Stacy were engaged in sawing off a main bent, while the laborers were pulling on another portion with tackles. The bent gave way and the men fell to the ground, about 25 feet. Stacy fell into the pit of the stone foundation formerly occupied by an engine and was instantly killed. Williams struck at the foot of the waste dump and had one leg broken near the thigh and one side of his skull fractured.

THE increase in the value of real estate in Santa Barbara during the last six months has been something remarkable. The ruling rates for desirable property is twice, and in many cases three times, what it was half a year ago, and the tendency is still upward.

THE San Francisco iron market is quiet, although there is a hopeful feeling owing to advances in the iron trade at the great manufacturing points on the Eastern coast.

THE Government printing presses are turning out 80,000 one-dollar silver certificates a day. The supply does not equal the demand.

#### Turn-in and Turn-out Sluices.

In continuing the subject of mining sluices from the last number of the PRESS, we have taken engravings from Mr. Bowie's work on "Hydraulic Mining in California" to show turn-in and turn-out sluices and their construction. Diagram 1 shows a turn-in sluice, adopted, after many experiments, at the Delaney claim, Patrickville, in this State. It was set with what is perhaps the sharpest curve that can be given for successful work to a sluice 4 feet wide and 32 inches deep, on a  $3\frac{1}{2}$ -inch grade to 16 feet.

The amount of water used was from 1000 to 1400 24-hour inches. The grade was light and dump for the tailings could be obtained only by means of direct connection with the Patrickville main sluice.

With any decrease of the radius the sluices

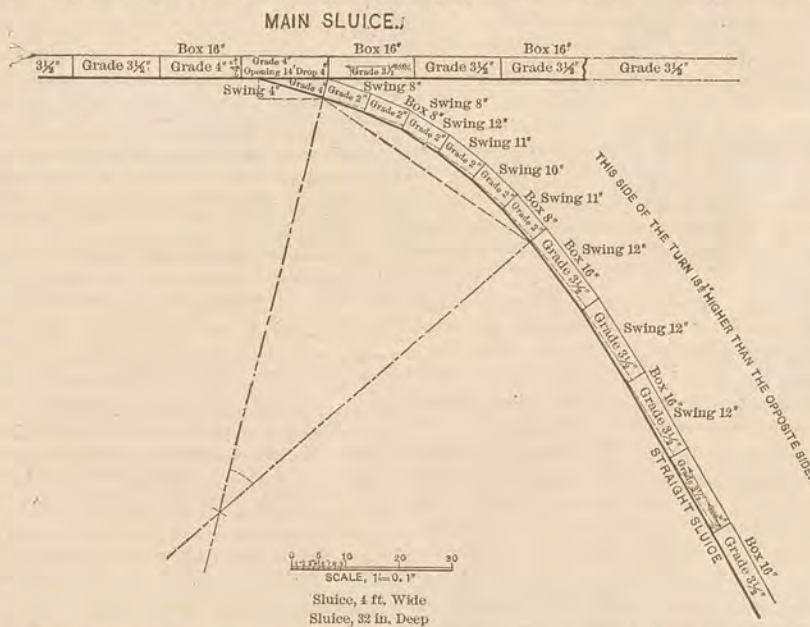

Fig. 1.—TURN-IN SLUICE AT HEAD OF TUNNEL, DELANEY CLAIM.

would not run uniformly, but would deposit tailings. The smallest radius of the curve having been ascertained by experiment, the next question that presented itself was: Would the main sluice carry the tailings discharged into it? As the main sluice was straight, and the general fall of the ground slight, an attempt was made to economize grade and run this sluice, with its original grade of 3 inches to 16 feet, below the junction, but the experiment was unsuccessful.

The main sluice was then taken up and a  $1\frac{1}{2}$ -inch drop was given from the turn-in sluice at the junction, and the first two boxes from this

The opening at the points of divergence was originally made 14 feet wide and a drop of  $1\frac{1}{2}$  inches given from the main sluice to the turn-out sluice, which latter was set on a "swing" of 4 inches to 16 feet.

The sluices thus constructed were found to run satisfactory, but on increasing the "swing" (as became necessary) to 5 inches the boxes on either side of the junction choked, only partially discharging the material, which difficulty could not be obviated by increasing the grade. On increasing the width of the discharge opening from the main sluice, which was gradually widened from 14 feet up to 24 feet, the sluices ran uninterruptedly and no further difficulty was experienced.

The first bottom box was cut in the form shown in Fig. 2—that is, from a point to full width; the succeeding half box of 8 feet was high on the outside, set with a slight increase in

Fig. 2.—TURN-OUT SLUICE BOX.

point were set on a grade of 4 inches to 16 feet, while the remaining boxes had a  $3\frac{1}{2}$ -inch grade to 10 feet. This improved matters, but material still accumulated in the main sluice at the junction and in the one box below. The turn-in sluice was then given a drop of 4 inches at the junction and the discharge opening was increased from 11 to 14 feet; the sluice then ran uniformly.

The outer course of the sluice was set a half-inch higher than the inner side. The boxes forming the curve were made in lengths of 8 feet each, and a grade of 2 inches given each box. The head of the sluice was straight, as well as the lower end below the junction.

The "turn-out" sluice is generally used when the dump-room is very limited. It is more difficult to operate on a light grade than a turn-in sluice.

At the La Grange Company's mines, in this State, the grades varied from  $2\frac{3}{4}$  inches to 4 inches per 16 feet, and the dump-room was very limited, necessitating many turn-out sluices and frequent sharp curves. As the dumps filled up the sluices were extended, and every available space was utilized which could be reached with a branch sluice.

across the main sluice. This concentrates discharge and prevents the forming of bars.

#### Con. California and Virginia.

The old Consolidated Virginia and California mines, now owned by one company, which paid immense dividends when in bonanza, are being worked vigorously still, but their yield is much diminished and they are paying no profit. It will surprise many, however, to know that they have produced \$1,297,881 during the last year, a sum that would be considered very large for an ordinary mine. It is true that no dividends have been paid, but this yield alone would give a reputation to many a mining camp. As a general thing, when we hear of bullion product we do not hear of expense account at the same time. During the past year the Consolidated California and Virginia Mining Company extracted and milled 98,834 tons of ore, producing \$1,297,881.81, of which \$659,647.81 was gold and \$638,234 was silver, the average yield being \$13.13 per ton.

The Jones lease was surrendered to the company on January 1, 1886, up to which date there was extracted from the mines and milled

under the terms thereof 10,369 tons of ore, yielding bullion of the assay value of \$184,742.67, of which \$74,276.13 was gold and \$110,466.50 in silver, being at the rate of \$17.81 per ton. According to the terms of the contract, this company received (at the rate of 50 cents per ton) the sum of \$5184.80 royalty on the above-mentioned amount extracted and milled.

Since the surrender of the Jones contract and the resumption of work by the company through the old Consolidated Virginia shaft, explorations have been carried on vigorously on the 1200, 1300, 1400 and 1500 levels, resulting in the discovery and extraction of large quantities of low-grade ore, being principally from portions of the old ore body left behind in former workings, lying to the south of the Consolidated Virginia shaft. There are still large quantities of low-grade ore in this portion of the mine, on the 1400, 1500 and 1600 levels, which may be extracted by proper management.

As showing what it costs to run such a big mine, some of the items of expense may be mentioned: Salaries and wages cost \$275,769; wood, \$50,141; timber and lumber, \$87,934; powder, caps and fuse, \$20,844; reduction of ores, \$603,789; Suto tunnel royalty, \$109,204; ice, \$7168; candles, \$7017; oils and lubricants, \$4268; drill fittings, \$4793; iron and hardware, \$4236; water rent, \$6150; assay office, \$11,492; taxes, \$5542. The whole disbursements aggregate \$1,243,682. The ore yield is stated above.

#### How Discount on Silver Works.

The Paradise Valley mine, Spring City, Mount Rose district, is one of the few profitable mines of Nevada, and has been paying dividends for some time. The last year has been marked for success, as has been demonstrated by the payment of dividends numbers six, seven and eight, aggregating \$60,000, with a surplus on hand of over \$20,000, sufficient to pay dividend number nine, of 20 cents per share.

The mill has run steadily for the past year. Total number of working hours, 8760; total number of hours run, 8475; number of hours lost for year, 285.

Total number of tons of ore milled, 6890; blanket tailings, 997; tons of ore and tailings milled, 7887; average battery assays of ore milled for year, \$54.37; average battery assay of blanket concentrations, \$53.51. The ore produced from the mines has aggregated 7631 tons.

The ore is concentrated and the concentrates shipped away to be worked. The concentrations produced last year were as follows: 13,308 sacks, 1,265,842 pounds; par value, \$361,624.29; cost of reduction at smelters and freight from Ogden to Argo on concentrations, \$27,526.97; discount on silver, \$77,580.82, total, \$105,107.79. Net proceeds of sales of concentrations, \$256,516.50; silver bullion produced, bar No. 141, net, \$1,105.84, bar No. 142, estimated, \$800, total, \$1,905.84. First-class ore produced and shipped without milling, 4360 sacks, 509,390 pounds, par value, \$66,733.69; cost of reduction at smelters and freight from Ogden to Argo, \$8284.24; discount on silver, \$14,640.56, total, \$22,924.80; net proceeds sale of first-class ore, \$43,808.79; total production for year, \$302,231.13.

The superintendent of the mine, J. V. McCurdy, in his annual report, has the following paragraph about the discount on silver and its influence on mining operations:

By the discount on silver we have suffered a loss of \$77,580.82 on the shipment of concentrations and \$14,680.56 on the shipment of ore, making a total loss by the discount on silver of \$92,221.38. This loss is deplorable, as it does not go toward benefiting any one who has been directly connected with it either in the labor of production, or who have risked their fortunes and spent years of their lives in search of the precious (but depreciated) metal, employing skilled labor, developing the resources of the country, assisting the manufacturer of the East as well as the West, and purchasing by means of the product of his toil all of the products of skilled labor, as well as the natural products of all parts of our continent, thereby furnishing a supply of money as well as employment to all classes of laborers, directly and indirectly. Instead of this it goes toward benefiting a few non-producers, who, for the sake of gain unto themselves (and a severe loss to the producer) keep silver depreciated and fluctuating in its market value, as a matter of a few shares of stock would be handled, and they rob the producer of his hard earned dollars. While lamenting this unquestionable fact, we trust that in the near future the masses will learn to understand the true state of affairs, and a remedy will be found for this crying evil.

## MECHANICAL PROGRESS.

## Oil Circulation in a Loose Pulley.

After every arrangement in the Babbitt metal line has proved a failure, and the bronzed bush with a space inside for an oil chamber is found to be of no use, a cast-iron sleeve perforated with a number of three-eighths of an inch holes and fitted loosely that the wheel may turn on the sleeve or together revolve on the shaft, is found to run cool without giving any trouble. A smooth, even surface has been the cause of heating in a great many cases, and it was only after the bearings were roughed out with a coarse file that they continued to run cool; but it will be noticed that the imperfect surface is always made in the bearing and not on the journal. It is to be supposed that the load on a shaft is to be evenly distributed over the bearing, to work in the best condition and avoid the inequality of pressure that might bring an injurious strain on some portions of the bearing, and by causing a roughness to be left on the bearing surface would be contrary to the first elements of the best working conditions. But these narrow, imperfect grooves are, no doubt, when oil is plenty, the means of providing an even pressure over the bearing surface of the journal, and keeping the surfaces in contact well lubricated. It has been found that by drilling a hole in the bearing where the most intense pressure is found, the oil is ground into the cavity faster than it is drawn out; in other words, the oil has better means of passing down on the receiving side of the bearing where the space is continually growing smaller till it enters the drilled hole, than it has in finding its way out, creating a pressure of a number of pounds to the square inch, the tendency of which, it will be easy to see, is to assist in supporting the shaft. If three oil cups are needed to keep a pulley with a perforated sleeve well lubricated, there may be, and no doubt is, a partial support to be derived by the overflowing of the perforations with oil; but a far greater advantage is derived from the benefit that every portion where the load on the shaft is brought to bear has a reservoir of oil close by to draw from and not to be deprived, as in a smooth and accurately-fitted box, where the particles of lubrication are wiped entirely away before they reach the place where all the friction is found.—*Boston Journal of Commerce.*

**SPEED OF MACHINES.**—A very simple way of getting at the speed of any machine you are about to start, and which has an intermediate or counter-shaft, is to draw a perpendicular line, and put the speed of line shaft and all sizes of the drivers on the left-hand side of the line. Then put all the sizes of the driven pulleys, with X for the required speed, on the other side of the line. Thus: Take the speed of a line shaft at 300, which has a pulley 20 inches in diameter, driving tight and loose pulleys on a counter-shaft which is 10 inches in diameter. This counter-shaft has a pulley 18 inches in diameter driving a cutter-head whose pulley is three inches in diameter. What is the speed of the cutter-head? By putting the figures representing the driving speed and all the drivers on one side, and all the driven on the other, and working by cancellation, we find that the required speed of the cutter-head is 3600, thus:

$$\frac{300 \times 20 \times 18}{10 \times 3 \times X} = 3600$$

This same rule is equally handy for the determination of the size of any drivers or driven pulleys, driving or driven speed. It is a simple and direct method, and it is accurate and quickly learned. It beats guessing all to pieces.—*Dominion Mechanical News.*

**STEAM VS. WATER AS A POWER.**—The motive power for the industries of the United States is yearly becoming more dependent on the economical utilization of steam and fuel. The water power of the older sections of the country is well developed toward its full capacity, and where this is not the case, its inaccessibility to manufacturing purposes renders inoperative the employment of steam. There are probably, to-day, in the United States as many as 70,000 stationary engines, furnishing 2,500,000 horse power; and we think we are not far out of the way in the statement that 70 per cent of the motive power of the States is obtained from steam. Sixteen years ago the supremacy of steam power was but two per cent more than half the total power required for the industrial enterprises of the country. The iron and steel manufacturing industry depends almost exclusively on steam power, and the lumber trade is chiefly devoted to this kind of motive agency. The greatest increase in the percentage of steam power has been, for the last 10 or 12 years in the textile manufacturing establishments, from necessity and not from choice.

**METAL SAWS.**—A German firm are referred to by the London *Ironmonger* as sending out some specimens of their diamond steel saws for metal-cutting, which, they claim, unite thorough pliability of blade with the highest degree of hardness. The makers point out that metal saws hitherto in use which possessed the necessary hardness could not be produced, in consequence of their brittleness, of less thickness than one-twelfth inch. Thinner saws being only blue-tempered, the teeth wear down

in a very short time, and are also very liable to break. Hartmann & Co.'s diamond steel saw being hardened on a new principle enables the blades to be produced as thin as one-twenty-fourth inch, with teeth which can hardly be broken with fair usage upon any kind of work. The saws are supplied in lengths of 11, 11½ and 12 inches, and in packets of not less than one dozen.

**A NEW PROCESS OF ROUND FORGINGS.**—Mr. George H. Simonds, of Fitchburg, Mass., has invented a machine for the purpose of forging iron or steel in any form which can be turned. This involves an entirely new method of working iron. Instead of being hammered or rolled to the desired form, the mass of red-hot metal is placed in a groove in two plates which are moved in reverse directions; the grooves are in primitive form at the places where the iron first enters between the plates, and along its course these grooves become more closely in conformity to the shape which is given to the finished piece, which is twisted into shape. The process is applied with success to the manufacture of conical shot, forged out of steel, the British Government having given an order for 500,000 shot, which are being made by the English representative. This process is applied to the manufacture of any small iron or steel pieces of turned form.

**MACHINERY NOT LABOR-SAVING.**—Machinery is not labor-saving, remarks a cotemporary. The man who works with a thrashing machine works as hard as his grandfather did with a flail, but he produces greater results. To those who think only of the price of wages, machinery is a fraud, but to the consumer of manufactured articles it is a boon. Our mothers used to card their own wool, spin and weave it and wear it, and it is no disparagement to our wives and sweethearts that they do not. They can't afford to. If it were not too expensive the present race of girls and women would do this, and more too. Machinery has not obviated the necessity of work; it has only given it a new direction. Good machinery is a good thing, but a man who expects it to do his work will be misled; it helps him to do more work.

**STONECUTTING MACHINERY.**—Among the inventions that have recently been patented we notice that stonecutting by machinery has received some attention. It has been a difficult task for inventors to contrive some way to operate on a block of granite so as to leave a true even surface without breaking down the edges, and more especially the destroying of the edges of the cutting tool. Nothing as yet has stood up to the work equal to the cold chisel and hammer unless it is the soft iron band sharpened up with the grit of quartz sand. A Boston stonecutter has been trying his hand at ornamental stonework and finds no difficulty in cutting out some of the finest designs by rocking a figured die in contact with the object with a layer of attritious substance between them.

**CEMENT FOR IRON.**—A correspondent of the *English Mechanic* says that he used the following recipe with the greatest success for the cementing of iron railing tops, iron gratings to stoves, etc., and with such effect as to resist the blows of a sledge hammer: Take equal parts of sulphur and white lead, with about a sixth of borax; incorporate the three so as to form one homogeneous mass. When going to apply it, wet it with strong sulphuric acid, and place a thin layer of it between the two pieces of iron, which should then be pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the iron will have the appearance of having been welded together.

**CHEAP ENGINEERS.**—The tendency to employ cheap engineers is, no doubt, a fruitful cause of disaster, and under careless management the best boiler may be ruined in a week or less. The desire for excessive pressures, especially on boilers that have been some years in use, and that are not of sufficient capacity for the work required, is another fruitful source of disaster. Steam users in many cases forget that with the enlargement of their works for increased production they should add correspondingly to their boiler power. They often try to provide for this increase of product by ordering their engineers to increase the pressure on the boilers. This is all wrong, and it invites disaster.—*Boston Commercial Bulletin.*

**TESTING BOILERS.**—It is customary with some mechanics to test new boilers, or old ones which have undergone repairs, by simply subjecting them to a high steam pressure. Why any intelligent person should do this passes our comprehension. If a boiler is known to be strong enough to sustain a certain pressure, there is no earthly reason to subject it to that pressure. If, it is not absolutely certain that it will safely sustain any given pressure, then it is the height of folly, and it incurs a risk that no man can afford to take, to apply that pressure in such a manner that, in the event of the boiler not proving strong enough to sustain it, an explosion will inevitably occur.—*American Miller.*

**SODA WATER.** not the drug-store article, but washing soda dissolved in water, it is said, will effectually cool any hot box.

## SCIENTIFIC PROGRESS.

## Nature the Great Teacher.

Rev. J. G. Wood, in his new book, "Nature's Teachings," has discussed a subject not before handled at length. The object is to show how man's implements and mechanical devices have been anticipated in Nature. He asserts that there is no invention of man which was not anticipated by Nature; that all his mechanical devices have been used in Nature for countless ages. He claims that the great discoverers of the future will be those who carefully study the natural world.

The Burr-stones of mills are a copy of molar teeth. The hoofs of a horse are made of parallel plates like a carriage spring. The finest file made by man is a rough affair when compared with the Dutch rush used by cabinet-makers. The jaws of the turtle and tortoise are natural scissors. Rodents have chisel teeth, and hippopotami have adz teeth, which are constantly repaired as they are worn. The carpenter's plane is anticipated by the jaws of a bee. The woodpecker has a powerful little hammer. The diving-bell only imitates the work of the water-spider. This insect, although as easily drowned as any other, spends a great part of its life under water. Having constructed a small cell under the water, it claps a bubble of air between its last pair of legs and dives down to the entrance of its cell, into which the bubble is put. A proportionate amount of water is thus displaced, and when all of it is expelled the little animal takes up its abode in this sub-aqueous retreat.

In laying its eggs on the water, the gnat combines them in a mass shaped somewhat like a life-boat. It is impossible to sink it without tearing it to pieces. The iron mast of a modern ship is strengthened by deep ribs running along its interior. A porcupine quill is strengthened by similar ribs. When engineers found that hollow beams were stronger than solid ones, they only discovered a principle which had been used in nature for centuries before the creation of man. A wheat straw, if solid, could not support a heavy head. The bones of the higher animals, if solid, would have to be a great deal heavier to bear the weight which they have to support. The framework of a ship resembles the skeleton of a herring, and he who would improve aerial navigation might study the skeleton of a bird with advantage. Palissy made a careful study of the shells by the seaside, in order to learn the best method of fortifying a town.

The ship-worm feeds on wood, and gradually tunnels its way through any submerged timber. It also lines its burrow with a hard, shelly coating. Brunel, taking a hint from this, was the first to succeed in sub-aquatic tunneling. The Eddystone lighthouse is built on the plan of a tree-trunk, and fastened to the rock in a manner somewhat similar to the way a tree is fastened to the soil. It is supposed that the first idea of a suspension bridge was suggested by the creepers of a tropical forest.

Mr. Wood gives an interesting account of the origin of the plan for the Crystal Palace. Mr. Paxton, a gardener, having noticed the structure of the great leaves of the Victoria Regia, a plant which had been introduced into England a few years previous, struck the plan of copying in iron the ribs of the leaf and filling the remaining space, which corresponds to the cellular portions of the leaf, with glass. Thus, by copying nature, an obscure gardener became Sir Joseph Paxton, the great architect.—*Wilmington Collegian.*

**WEATHER FORECASTS.**—Dr. Lonie, of St. Andrews, has lately drawn attention to some of the leading facts connected with the science of "weather forecasts" and with the theory of circular storms. He states that a strict examination of the records of the weather in the Greenwich observatory has conclusively proved that predictions based on the moon's changes are delusive. The same results have been shown from records kept for long periods of time in this city and in Philadelphia. But in the matter of sun-spots the case is different. There is a remarkable concurrence of scientific opinion that the 11½ years' cycle of their recurrences leads to increased solar radiation, of which we have our share in the form of increased evaporation and rainfall, and consequent development of cyclonic and magnetic storms. According to Dr. L., we are now approaching a period of maximum sun-spots, during which we may expect an unusual amount of rainy weather. Such a law, if once established, would prove to be an important means of weather-forecasting over long periods, and, looking backward over the more remarkable weather events of the century, Dr. Lonie finds two witnesses equally for its truth and its value. It has been remarked that a mild winter in Europe often corresponds to a severe one in Asia and America, and that a mild winter in America corresponds to a cold one in Europe. A severe drought nearly destroyed the crops of Europe in 1846, while America had an abundant harvest.

**CURIOS ILLUSTRATION OF THE FLOW OF METALS.**—The flow of metals is illustrated very curiously, says the London *Engineer*, in one phase of Japanese art metal work, of which, however, it is quite difficult to obtain native examples. In its preparation thin layers of copper, precious metals and various alloys are soldered in superposition like the leaves of a

book. Through these layers holes are drilled to various depths in the thickness of the metal, or trenches are cut in it. The mass is then hammered flat until the holes or trenches disappear, and the result is contorted bands of some complexity, possessing much beauty, especially when the color of the metal is developed by suitable chemical treatment and polishing. A similar effect may be produced by beating up the metal from one side and filling the other flat.

**EFFECT OF AN EARTHQUAKE ON THE OCEAN.**—The chief effect of an earthquake on the ocean is the raising of a great sea wave, sometimes very large, e. g., 60 feet high at Lisbon (1761); 80 feet at Callao (1724); 210 feet at Lupaika (1737). These waves are often more destructive on land than the actual shocks; the influx is usually preceded by an outflow, which, in fact, acts as a warning. One of the most remarkable effects is the distance to which these waves are propagated as "great waves," e. g., right across the Pacific. Thus most large earthquakes on the east and west coast of the Pacific produce waves which are recorded on the opposite coast about 24 hours after. As to prediction of earthquakes, nothing certain is yet known. In many cases there are noticeable changes in springs and wells preceding earthquakes. One useful warning is, however, obviously possible, viz., the report of an actual earthquake on one side of the Pacific Coast could be at once telegraphed to the other side, thus giving 24 hours' warning of the probable advent of a great sea wave.

**AN ELECTRIC PLANT.**—Phytolacca electrica is the name given to a plant which possesses strongly marked electro-magnetic properties. In breaking a twig the hand receives a shock that resembles the sensation produced by an inducting coil. Experiments made on this plant, says the New York *Medical Times*, showed that a small compass was affected by it at a distance of about 20 feet. On a near approach the needle vibrated, and finally began to revolve quite rapidly. The phenomenon was repeated in a reverse order on receding from the plant. It is said that no birds or insects are ever seen on or about this plant. The soil where it grew contained no magnetic metal like iron, cobalt or nickel, and it is evident the plant itself possesses this electrical property.

**THE AURORA'S HEIGHT.**—Many attempts have been made to fix the height of the aurora borealis, but the estimates have given a discouragingly wide range of figures. The aurora has been observed when it seemed to rest on the earth's surface, and at other times has appeared simultaneously at stations so widely separated that it has been supposed to be 200 or 300 miles high. In experiments with his powerful voltaic battery, practical demonstrations of the effects of electrical discharges in rarefied air were made by Dr. De la Rue. These forced him to the conclusion that 38 miles is probably the height at which the most brilliant auroras take place, that a pale and faint glow may possibly be produced as high even as 82 miles, but that at a height of 124 miles no aurora discharge is possible.

**UTILIZING SEA-WEED.**—An English chemist has found a way for turning to account the practically illimitable quantity of sea-weed that the ocean supplies, or at least as much of it as may be desired. He boils the weed with carbonate of soda, and treats the filtered solution with sulphuric acid, obtaining from it in this manner a substance that has more viscosity than starch, or even gum arabic, and that can be profitably employed in stiffening various textile fabrics. It is also said to be excellently adapted for the making of syrups and for certain culinary uses. From the cellular and fibrous matter left after the extraction of that material—to which he has given the name of "algina"—a very good quality of writing paper can be cheaply made.

**THE TELEPHONE.**—Every one who has used the telephone much knows how troublesome "cross talk" is at times. Indeed, in lines not more than 10 miles in extent, if there be parallel wires, a good, clear service is not to be thought of. In this regard, a curious discovery was recently made by one of the speakers at the recent convention. He says that when it is found impossible to work two parallel wires at the same time, if those using one of them will speak German or any other foreign tongue, while those in the other are speaking English, they will have no trouble in making themselves understood.

**RENEWING ITS VIGOR.**—Vesuvius furnishes an example of a volcano whose activity has been increasing instead of diminishing during the last 2000 years. At the beginning of the Christian era the mountain's fires seemed to have been long burned out forever, and the eruption which buried Pompeii and Herculaneum in the year 79 was the first known. The next outbreak was not until 1036, and thereafter several came at intervals of a century or more, but since 1631 the eruptions have been very numerous.

**GERMAN EXPERTS** say that Schleimann's excavations in Greece have revealed a wealth of material for designers in woolen goods. The ancient patterns reproduced in modern fabrics would have a charming effect.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**NIPPERS FOR PILE-DRIVERS.**—Henry Von der Wulbecke, Arcata, Humboldt county. No. 350,223. Dated Oct. 5, 1886. The invention relates to that class of nippers which are used on pile-drivers for engaging the weight or hammer, whereby it may be elevated and again released, so that it may drop upon the pile. The invention consists in the novel construction and arrangement of the opposing spring, actuated jaws or hooks, and the means for relieving them of their engagement, together with peculiar cushions for the nipper-head.

**SEPARATOR AND CLEANER.**—Alfred Swingle, S. F. No. 350,171. Dated Oct. 5, 1886. This is a machine which is to be employed in separating or cleaning peas, beans, almonds, etc., after being shelled. It consists of a box or drum revolving upon a horizontal axis and adapted to receive the shelled peas or other articles in its interior, screening material for separating the larger from the smaller articles or cleaning them from dust or lighter waste matter, and a peculiar cam with its adjuncts whereby a longitudinal shaking motion may be given to said drum or box.

**DERRICK.**—George Rounds, Vallejo. No. 350,213. Dated Oct. 5, 1886. This derrick consists of three standards or legs, two of which are united permanently at their tops and are hinged to the bed or frame at their feet, and the third of which is hinged at its foot and has its top fitted between and guided by the other two, and in a block-and-tackle mechanism by which the legs are raised and lowered, with limiting stops for the lower leg. The object is to provide a derrick which is simple and cheap in construction, and so arranged that it can be readily raised and lowered with but the exercise of a small amount of power.

**GREASETRAP.**—Chas. H. Ackerson, S. F. No. 350,181. Dated Oct. 5, 1886. The usual construction of grease-traps provides for the rising of the grease to the surface where it may be collected, while the water may pass off through the lower part of the apparatus; but in practice this is found defective, because much of the grease becomes mixed with heavy dirt and sediment which will carry it to the bottom, so that it will escape through the passages with the water and in time clog them. Mr. Ackerson's invention is designed to provide receptacles for the grease, above and below which the water is allowed to escape through intermediate passages in the diaphragm.

**FURNITURE-SUPPORT.**—Chas. M. Plum, S. F. No. 350,390. Dated Oct. 5, 1886. This invention relates to a device which is especially useful for the support of certain articles of furniture when not set up for actual use, such as the head and footboards of bedsteads. It consists of a narrow board or plate, having latches or hooks on each edge, so that it may be introduced between the head and footboard, the latches entering the openings which are ordinarily employed for holding the side rails in place when the bedstead is set up, and in connection with this is employed a support with casters, upon which the head and footboard may rest, close together but just out of contact. This device is useful while furniture is being manufactured, when on exhibition, for sale in stores and during transportation.

**OVERPRODUCTION.**—In former years, when all the world bought its iron of England, there was no necessity for restricting production. Under that favorable state of the trade there grew up in the minds of English economists the idea that it was wrong and unprofitable to form combinations for the purpose of regulating production or prices. During recent years, however, other countries have greatly increased their production of iron, and the result is that the iron-producing countries of the world have capacity to produce more iron than the world consumes. This has made it necessary to keep a part of the producing capacity idle. But while this necessity has been acknowledged, and made painfully manifest by increasing stocks and decreasing prices, the necessity has not at all times been made the basis of action, each company feeling that it had as good a right to its share of the trade as any of the other companies, and would not lessen production unless the others would. This has forced combined action, and has led to a very perceptible change in the views of the economists of England upon the subject. It is true the most of them still keep up a show of adherence to the former belief, but it is done in such a way that they may be classed with the man who was "in favor of the Maine liquor law but agin its enforcement."—*Ex.*

MUCH work in the mining-machinery line, which used to be done in San Francisco for Arizona and Montana, has been cut off, because of the construction of railroad lines through these districts, by means of which Eastern manufacturers are placed at an advantage over local manufacturers. In consequence of all this the outlook for the trade here is not good, competition is keen, work slack and prices unsatisfactory.

## USEFUL INFORMATION.

## Does Charring Timber Promote Durability?

The general belief has long been that it does, and in accordance with this conviction the practice has been widely followed. But a contrary view of the subject is taken by *Wood and Iron*. That journal says, in a recent issue: As charcoal would endure for ages in places where timber would decay speedily, the practice of charring the surface of fence posts and other timber has been repeatedly recommended in books and ephemeral publications as eminently worthy of universal adoption.

The theory upon which such a recommendation is based would seem to warrant a confident expectation of satisfactory results in practice, but repeated experiments with charred timber have furnished conclusive assurance that this process will not promote its durability. Indeed, numerous experiments have shown that charring promotes premature decay. Two posts split from the same log may be set side by side in the ground, the surface of one being charred and the other not, and it will be seen that the charred post will perish before the other.

The same is true of railroad ties and all such timber as may be exposed to the alternating influences of wet and heat. Could the entire timber be changed from its perishable condition to one solid piece of charcoal, the durability would be promoted to a surprising length of time, but the strength of the material would be destroyed. When fence posts or other sticks of timber are exposed to the rapid action of wet and heat, the surface will decay first. One might suppose, therefore, that when timber is enveloped by a layer of charcoal the durability of the entire piece would be greatly promoted, and such would be the case were it not for the fact that the charcoal is not impervious to water; and as water reaches the timber below the charred surface, decay will commence soon after the grain of the wood has been exposed to the influences of the weather. When the change has once begun beneath the charred surface the durable covering of coal will be of no service whatever in preserving any portion of the wood. Taking this practical view of the subject, it will be perceived that if only half an inch of the outside of a post be charred the post will not endure so long as if the same thickness of wood had been left uncharred to waste away by slow decay.

**TAPPING THE PINE FOR TURPENTINE.**—The *Northwestern Lumberman* remarks that the extent to which tapping a yellow pine tree injures the timber is a question that has not been decided. There are men who assert that lumber produced from the timber cut in a turpentine district is not so good as that from trees which were never boxed, yet how little these men know about it is shown by the fact that if the two kinds of lumber be laid side by side they are unable, oftener than otherwise, to tell which is which. Government contracts for yellow pine specify that it must be unboxed, but it is an open secret that Government timber-inspectors cannot detect the difference, and as a result the contractor is not particular to follow the instructions of the document by which he is supposed to be guided. The absence of pitch in the wood is generally supposed to be evidence that the tree was tapped. The evidence is misleading, however, for tapped timber is sometimes full of pitch. The subject is one which theoretically has caused some commotion, but which practically, so far as we have observed, is of less importance than has been ascribed to it by many.

**TYPE-WRITING INK.**—The ink that is used in inking the indelible ribbon in type-writers, which writes black but copies a very dark blue, is made as follows: Take vaseline of high boiling point, melt it on a water bath or slow fire, and incorporate by constant stirring as much Prussian blue as it will take up without becoming granular. Remove the mixture from the fire, and while it is cooling mix equal parts of petroleum, benzine and rectified oil of turpentine, in which dissolve the fatty ink, introduced in small quantities by constant agitation. The volatile solvents should be in such quantity that the fluid ink is of the consistency of fresh oil paint. One secret of success lies in the proper application of the ink to the ribbon. Wind the ribbon on a piece of cardboard, spread on a table several layers of newspapers, then unwind the ribbon in such lengths as may be most convenient, and lay it flat on the paper. Apply the ink, after agitation, by means of a soft brush, and rub it well into the interstices of the ribbon with a stiff tooth-brush. Hardly any ink should remain visible on the surface.

**THE WAX PROCESS FOR ENGRAVING.**—By means of the new and ingenious little instrument known as the hyalolypotype, or hot pen, drawings can be made on glass or glossy substances with a waxy composition, which is solid and somewhat hard at ordinary temperatures. The pen is so contrived that it can be heated by either gas or an electric current, and the waxy material flows easily from the heated pen, setting so quickly on the glass that cross-hatching can be done more rapidly than with ordinary pen and ink, without risk of blocking up the angles; corrections, too, can be made

with the greatest ease by means of a penknife, which leaves the surface afterward intact. After the drawing has been made, the plate is etched by fluorid acid, and when it is complete it can be either electrotyped, stereotyped, used direct or applied to any purpose for which engraved surfaces are applied.

**WHEN FILING HAND-SAWS** there are two objects to be kept in view—namely, cutting off the fiber of the wood, and removing it as fast as it is severed. If the teeth be filed too fleaming, they will cut faster than they will remove the sawdust. On the contrary, if the faces near the points be not dressed fleaming enough, the saw will tear out the kerf in a rough manner, rather than cut its way through the timber. When you are filing a saw and the file gets gummed up, don't try to work with it so, or throw it one side and get a new one. If you have no card to clean the file, take a piece of pine wood three-fourths inch square by three or four inches long. Rest one end of the file upon the bench: with the little stick strike the file nearly edgewise with the square corner of the stick, following the slant of the teeth. This will clean a file nicely and without causing half the wear that a card would. A little practice would enable you to clean a file in half the time it would take you to hunt up a card-cleaner.

**BUYING A HAND-SAW.**—Stiff blades are made of better material than thick ones, and are less liable to "buckle" or "twist," and are not so apt to break. They require less set, will stand an edge longer, and are not so tiresome to work. They should be hung in plain beech handles with rivets flush or countersunk. The blade should be of dark color and have a clear, bell-like ring when struck with the ball of the finger. Blades of a light, iron-gray color are not so good. Never take a saw that jars or trembles in the handle. The first point is to grasp it by the handle and see that it hangs right and that the handle fits the hand properly. Then try the blade, by springing it, and see that it bends regular and even from point to butt. See that it has a good crowning breast. Hold it at a distance and get a proper light to shine on the blade, and you will see if there is any imperfection in grinding and hammering.

It is estimated that the United States produces enough lumber each year to load 1,428,581 railroad cars, each averaging 7000 feet. This would make a train 8500 miles long, or about one-third around the globe.

## GOOD HEALTH.

**DR. ABERNETHY'S PRESCRIPTION FOR A DYSPEPTIC.**—General John A. Dix was at one time the unhappy victim of dyspepsia. After seeking in vain for relief, he was at length led to consult the famous Dr. Abernethy. After listening impatiently to his story, Abernethy interrupted him with these words: "Sir, you are pretty far gone, and the wonder is that you are not gone entirely. If you had consulted common sense instead of the medical faculty, you would probably have been well years ago. I can say nothing to you excepting this: You must take regular exercise, as much as you can bear without fatigue, as little medicine as possible, of the simplest kind, and this only when absolutely necessary, and a moderate quantity of plain food, of the quality which you find by experience best to agree with you. No man, not even a physician, can prescribe diet for another. 'A stomach is a stomach,' and it is impossible for any one to reason with safety from his own to that of any other person. There are a few general rules which any man of common sense may learn in a week, such as this: That rich food, high seasoning, etc., are injurious. I can say no more to you, sir; you must go and cure yourself." It is needless to say that General Dix was rewarded by restored health and a good old age.

**PHYSIC TIPPING.**—The vice of physic tipping, remarks a cotemporary, is spreading with alarming rapidity, and the medicine-bibber who indulges constantly in all sorts of doses, on his own diagnosis and prescription, is found everywhere nowadays. Even the soda-water fountains have been diverted from their legitimate function to that of supplying these unfortunates with powerful tinctures, potassium and sodium bromide, chloral-hydrate, bromal-caffeine, aromatic spirits of ammonia and deleterious "nerve foods"—such drugs, in short, as are best calculated, when habitually used, to destroy the physical health and upset the mind. The increase in the demand for those medicaments which act specifically upon the nervous system has been especially marked. The consumption of chloral and the bromides, but little known 15 years ago, now amounts annually to hundreds of tons. The habitual employment of insanity-producing drugs, disguised as "nerve foods" or otherwise, is becoming decidedly fashionable, so that one cannot help wondering, if it requires so many sedatives and stimulants to keep this generation at the proper level, what will become of humanity in the 20th century.

**POISONOUS PLANTS.**—It is very important for people to know which plants are poisonous and dangerous. One of the most popular groups of plants is the buttercup, but many of these are

sufficiently acrid to produce blisters when applied to the skin. The poisonous sumac is probably the most dangerous of all our native plants which poison through contact. Avoid all sumac which has not red berries, and you will be safe from poison. The common horse-chestnut is used in Europe as food for horses and cattle, and yet the small horse-chestnut of the South, "Buckeye," is claimed to be poisonous. The laburnum or gold chain, a common garden plant, has roots that taste like licorice and which thus tempt children to chew it. It is, however, a dangerous poison to eat. Water hemlock, fox-glove or digitalis, aconite, Jamestown weed or stramonium, common poke weed, skunk cabbage, poison ivy, and various other common weeds or shrubs, including some mushrooms, are rankly poisonous and should be avoided.

**A PROFITABLE DENTAL PRACTICE.**—The enormous wealth of the famous Parisian dentist Evans—not less than \$10,000,000 he is said to be worth—has been acquired not so much in the course of his regular practice as from the huge fees given him by distinguished personages in various parts of Europe who request his services from time to time. Thus he is always flying about from capital to capital, pulling a tooth from one crowned head and filling a "cavity" in another, of course receiving in such cases an emolument proportionate to the dignity of his patients. The jaws of half the nobility on the continent are kept in order by Dentist Evans, and the decorations he wears sufficiently attest their appreciation of his professional skill. It is said that he is the most decorated man in Europe. Ribbons and crosses cover him from head to foot, and many of them are of such great importance that they give him a quasi position upon which even dukes and princes can hardly look down.

**THE MORNING BATH.**—The cold or tepid sponge-bath, taken in the morning before breakfast, with friction to make the skin red, is one of the most health-giving actions we know. It promotes healthy circulation to the skin and all organs of the body, and keeps them in good condition and healthy in appearance. Some persons cannot indulge in such a "morning tub," by reason of peculiarity of constitution or from liver affections, and are unable to take the bath quite cold. It should, then, have just the chill taken off, but the skin should, in all instances, immediately after the bath, be thoroughly dried and rubbed with a coarse linen towel. No soap is used to this bath, and it is a good plan to have a warm bath about the temperature of 92° F. once a week. The brain is invigorated by the bath from the healthful stimulation of the nerves. If the person is not very strong, and the reaction is not perfect, a glass of very hot water taken after the bath will prevent a chill.

**A NOVEL INDUSTRY.**—Few persons on visiting a museum consider that such objects as skeletons require a certain fitting for exhibition. Yet the preparation of skeletons for the market constitutes a distinct industry, to which a large manufactory in the suburbs of Paris is devoted. Corpses are supplied from dissecting rooms and hospitals. On its delivery the raw material is boiled for days in a caldron, and the grease which rises to the surface is skimmed off and sold. The bones are carefully cleaned and bleached in the sun, and finally assorted and converted into articulated skeletons. The preparation of frogs, lizards, and various reptiles occupies a separate department.

**DURATION OF INFECTIOUSNESS.**—The duration of the infectious stages of various diseases is thus given by Dr. T. F. Pearce, an English physician: Measles from the second day of the disease, for three weeks; small-pox from the first day, for four weeks; scarlet fever from the fourth day, for seven weeks; mumps from the second day, for three weeks; diphtheria from the first day, for three weeks. The incubation periods, or intervals occurring between exposures to infection and the first symptoms, are as follows: Whooping cough, 14 days; mumps, 18 days; measles, 10 days; small-pox, 12 days; scarlet fever, three days; diphtheria, 14 days.

**OATMEAL FOR THE COMPLEXION.**—It would not be easy to find handsomer women anywhere than the oatmeal-eaters of Edinburgh, and the only ladies who equal them in rosy health and classic beauty of figure, so far as has been observed, are found in the interior districts of Ireland. Oatmeal would seem to have something to do with it, and every one may remember the reply of the Scotchman to the taunt of Dr. Johnson that the horses in England ate the same kind of meal as the men in Scotland. "Ah!" said Scotchie, "but such horses and such men!"

**PRECOCITY.**—Precocity is the too early unfolding of the higher faculties of the mind. For instance, the love of sport and play in a child would not indicate precocity; but a dislike of sport, and a love of arts, sciences and subjects proper for adults, would. Precocity is generally at the expense of physical development.

**COFFEE LEAVES.**—In coffee-growing countries an infusion of the leaves of the tree is held by many to be superior to the infusion of the berry. The probable value of the dried coffee leaves as an article of commerce has been suggested.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—Cor. Amador Ledger, Oct. 16: Work on the Mahoney tunnel is progressing satisfactorily. There remains a distance of about 150 feet to be tunneled, when, in all probability, everything will be in readiness for the starting up of the mill. The Mahoney mill will be used, as I was misinformed last week as to there being no pipe connection between the mill and Amador canal. It is the intention to start the entire 40 stamps, and there is pay ground in sight to run for at least a year. About 25 men will be employed. The new iron bridge to convey the pipe of the canal which runs to Plymouth across Sutter creek is rapidly approaching completion. There are two piers 18 feet high, and the bridge, as a whole, will be a very substantial structure and calculated to withstand any storm. The old Eureka mill has been sold to George Allen.

**DRYTOWN.**—Amador Sentinel, Oct. 13: The Olive mine has been reopened by M. C. Randolph, who has erected a whim that works like a charm. The water has been taken out and the shaft retimbered, and everything seems to be in a flourishing condition. The shaft is about 80 feet deep, with drifts running 30 feet east and west. A ledge four feet wide has been struck in the east end, and the prospects are favorable for a prosperous mine in the near future. Three men are employed in the mine at present. The Loyal mine still continues to develop in a satisfactory manner. Capitalists who are thinking of purchasing have been making a thorough exploration of it, but I have not heard anything definite concerning the success of the negotiations. The Gover mill, which has been idle for the past week on account of the water failing in the ditch, has started up again. Everything looks flourishing about this mine and as though the Gover was going to become one of the leading mines of the county.

## Calaveras.

**ACTIVE WORK.**—Calaveras Citizen, Oct. 12: Work on the Donnollan mine, at the Bay State Ranch, is being actively prosecuted. A new shaft has been sunk, a short distance east of the old works, and at a depth of 30 feet a fine body of good milling ore has been discovered. The proprietors, Messrs. Donnollan & Haggerman, are about to put a pump in the mine to free it of water, and intend to add five more stamps to their mill. Until such arrangements can be perfected they will keep their arrastra grinding ore.

## El Dorado.

**FINE QUARTZ.**—Placerville Observer, Oct. 16: The Hale and Norcross mine, recently purchased from Dennis Gallagher by the Melton brothers and Joseph Lyon, is showing some remarkably fine quartz, and expert miners predict that it will soon develop into one of the first properties of Mountain township. Work was commenced on the Idaho mine, Cosumnes township, last week, and Mr. Voss is hopeful of a bright future for the property.

## Fresno.

**AROUND HILDRETH'S.**—Cor. Fresno Republican, Oct. 15: Around Hildreth's times are lively. The gold fever is getting up to the proper heat. Many men are finding employment and a great deal of gold is being taken from the rocky fastnesses. Every day, nearly, witnesses a new claim and a prospect that is flattering. Miners are flocking to the quartz mines, and to give them the necessities of life and also some of the luxuries, new stores, hotels and restaurants are being continually opened. Lewis Wilson has made a big strike a mile and a half northwest of the Hildreth mines. It is a quartz ledge from three and a half to four feet thick, and is very rich. He was offered \$30,000 last Saturday for it by a San Francisco party. James & Frances have struck a mine half a mile northeast of Hildreth's mine. They have sunk a shaft 30 feet and have struck it rich. Blue & Bartlett are working a mine for one-third interest, belonging to Mrs. Wilson and Mr. Grisby. It is very rich and they have been offered a good price for it. The White Rock mine, belonging to McNalley, Grayson & Co., promises to be the finest mine in the mountains. They have struck an excellent body of ore. The Abbey mine is now 500 feet deep, and the vein is much richer. It measures three feet and four inches, and McNalley, who knows, says it will go \$200 to \$300 to the ton. They are working 60 to 70 men in the mine. The pay-roll amounts to \$3900 to \$4000 per month. Geo. Grayson, Duly and Nicholson and Webber are opening an extension of the Abbey mine, called "Grayson Mining Company's mine." The prospects are good. They are down about 70 feet already.

## Inyo.

**THE SODA WORKS.**—Inyo Register, Oct. 14: Some 35 men and 4 or 5 teams are constantly employed in excavating vats for the evaporation of the waters of Owens lake for the production of soda. These vats now cover an area of over ten acres. About 75 tons of crude soda has been crystallized this season, although it is not considered that even a commencement has yet been made. These cakes or crystals taken from the bottom of the vats are said to go 90 per cent soda. This material has yet to be "furnaced" before it is in a merchantable condition. By another season a furnace for this purpose will be built on the ground. The evaporation process cannot be advantageously carried on during the winter months, therefore that process may be considered ended for the present season. The work of preparing vats is to be pushed right along, possibly until the entire eastern shore of the lake is lined with them. While the enterprise is yet in its infancy, it has got in all its departments clear beyond the experimental stage, and may be set down as an established enterprise, and one certain to prove of very material importance to the business interests of the county.

**ANOTHER NEW MILL.**—Supervisor John Eddy and John Wilson, of Darwin, are building a new five-stamp mill at old Coso, some nine miles west of Darwin, and will have it under steam in four or five weeks. The mines of old Coso have been worked (by the Mexicans mostly) for over 20 years, and it was upon them that one of the first

mills ever built in the county was erected. It was destroyed by the Indians very soon after, however. The ores have since been worked by arrastras, and have always been considered exceedingly rich—running from \$50 to \$300 per ton in fine gold. The principal mine is down about 300 feet, and will furnish ore sufficient to keep the mill running constantly.

**RUNNING.**—The Hawley 10-stamp mill at Keeler was fired up about a week ago, and will be kept at work until 250 tons of second-class silver ore from the Ygnacio mine are put through. This ore goes about 40 oz per ton. The high-grade goes from four to six times as much, but has all been shipped to San Francisco. A good part of both classes came from new ground in the mine, the remainder from the old dumps. Mr. S. D. Woodhull is the assayer and mill manager.

**THE MARBLE WORKS.**—Mr. Luce, superintendent for the Inyo Marble Company down at the lake, has quite a force of men at work putting up his marble working machinery, and hopes to make a shipment of polished marble blocks before the beginning of another year. He has a fine building already up, with engine and all the special machinery on the ground. After a personal visit to the quarry, we give it as our candid opinion that this is probably the most promising and permanent enterprise ever started in this county. Experts say that the marble itself is the finest in the world, and we can testify that there is a mountain of it, also that the power for handling it is the only limit to the size of the blocks that may be taken from the quarry even now, at the surface of the ground.

## Mariposa.

**SURVEY.**—Mariposa Gazette, Oct. 9: Captain Diltz and James H. Malone have, during the past week, been making a survey for a pipe line, to bring the water from Snow creek into the mines of Sherlocks, Colorado and Saxtons, which they find will decrease the distance probably from one-third to one-half. They also find at the head of the ditch 24 inches of water at this season of the year which could be conveyed by means of a pipe without loss. The fall is so great that water can be carried or forced to any given height, mine or hill, occurring along the line of the survey. The great facilities for constructing reservoirs to catch and save all the surplus water is remarkable, and materially adds to the value of the enterprise. With this magnificent work once completed, the section of country which would be benefited would become a great mining center.

**IRON ORE.**—Merced Argus, Oct. 16: Johnny McCready, the Mariposa stage-driver, showed us a specimen of iron ore last night, taken from a mine at Mt. Raymond, near the Big Tree Station. The specimen shows richly of iron and contains considerable silver.

## Mono.

**THE BULWER CON.**—We have shipped to mill during the week 300 tons ore and crushed 220 tons, leaving 80 tons at mill. We will work 60 tons per day at mill. The pulp assays were as follows: Oct. 14, \$25.58; 15, \$29.40; 16, \$36.62; and 17, \$31.90. The mill is working well and the mine is looking well. We are taking out ore from the 50, 100, 150, 200, 300, 360 or tunnel level, and the 400 levels.

**THE STANDARD CON.**—Ore shipped to mill 339 tons. Standard side of Bulwer Standard mill running steadily on ore. Standard mill running to full capacity of pans on tailings. Bullion shipment was made on Tuesday, 12th.

**THE BODIE.**—South upraise from 700 is extended 27 feet.

**THE MONO.**—We are taking out rich ore below the 700.

## Nevada.

**SILVER ORE.**—Nevada Transcript, Oct. 16: The Fowler brothers, who have a claim near Banner mountain, and recently erected a mill for the crushing of the gold ore, find that, as they sink, gold is becoming scarce in the ledge and silver is coming in. The ore assays very high in the latter mineral, and 50 tons of it will shortly be taken to O. Maltman's reduction works to be put through as a test working. If the result is satisfactory, an effort will be made to put up on the mine the proper kind of machinery for milling silver ore.

**NORTH STAR MINE'S MILL.**—Foothill Tidings, Oct. 18: Work is going on with all dispatch in the way of building the new mill at the North Star mine. The Risdon Iron Works Co., of San Francisco, the contractor, is doing the most substantial kind of work. The iron pipe, for conveying water, for power, to the North Star from the Empire mine, will weigh about 130 tons. James Harrigan has the contract for hauling this pipe from the railroad depot to such points as the pipe is wanted. The weight of the metal of the machinery has also been increased over that at first agreed upon. Substantiality is the object aimed at for the revived North Star mill and mine.

## Placer.

**CROESUS.**—Placer Argus, Oct. 7: Another mine near Auburn that is doing well is the Croesus, on Baltimore ravine, owned by C. H. Mitchell, of Grass Valley, but which is at present bonded to the Hales brothers. These gentlemen have had charge of the property since January last, and have spent several thousand dollars upon it. Some 20 men are employed there. They have run a tunnel that is over 400 feet, and they have made other improvements. Last Friday they shipped 75 or 80 ounces of bullion, and yesterday they cleaned up about 100 ounces more, the latter from a five days' run of a five-stamp battery. W. J. W. Hubbell, agent for the company that owns the Belmont, is about to put on a force of men to work on that property. Col. J. W. McCullough has lately resumed operations on the Mina Rica mine.

**DOIG MINE.**—An item in last week's Argus was that Shurtleff & Robinson, of the Doig mine, Ophir, had shipped to San Francisco the day before 259 ozs. 12 dwt. 18 grs. of gold bullion valued at about \$18,000. The weight was 1259 ounces, etc., but by mistake the first figure was omitted. The amount in money was substantially correct, as correct, in fact, as we can give it now. Since then an additional shipment of 1400 ounces has been made by the same parties, making a total of nearly 2700 ounces within a week, or over \$40,000.

## Sierra.

**THE EMPIRE.**—Sierra Tribune, Oct. 15: At this mine great activity and life prevail. During the past week over 10,000 pounds of freight was received for

the new chlorination works. Fifty-two men are employed by the company. During the last storm 35,000 bricks, which were to have been used in building the chlorination works, became so soft from the rain and snow as to be totally unfit for use.

**THE CLEVELAND MINE.**—The new ledge at the Cleveland presents a good appearance. It runs in an easterly and westerly direction and is five feet in width. A crosscut will soon be made to tap the ledge. The Tribune people were shown a piece of the rock taken from it which showed up well in sulphurets and free gold.

**PHOENIX.**—Thirty men are now employed at the Phoenix mine, and it is expected that 20 more will be put on in a short time. It is stated that the rock in sight on the western part of the ledge will mill \$200 a ton. The Dakota claim in Lady canyon district is principally owned by Geo. Abbe, Sr. About 200 feet of tunnel has been run to date.

## Trinity.

**DEADWOOD.**—Cor. Shasta Courier, Oct. 16: The old Willey mine, now known as the Vermont, is still turning out good rock. I have just seen J. C. Leas, one of J. Falan's lessees, and he informs me that he expects the next cleanup will be better than the last, which was \$64 to the ton. Watson, who leased the Frick & Davis mine, at the head of Dornnigh gulch, is crushing his rock at the Dreadnought mill; report places it at over \$100 to the ton. It was more of a pocket than a vein, and he has got out all that was in sight. McDonald & Olive are building quite a village around their reduction works at the south fork of Deadwood creek. The works will be completed in about one month from date. They have 12 men employed. The Van Matre brothers have had another cleanup from their lease of the Brown Bear Company.

## Tulare.

**WHITE RIVER MINES.**—Visalia Delta, Oct. 14: D. B. James, who is in town from White river, informs us that he is at work on the old Keyes mine, which he bought a few months ago. The old shaft has been cleaned out and retimbered, and a drift started in from the bottom which follows on the ore vein. The width of the latter is 7 to 10 inches, and occasionally is 12 inches wide. The average width is eight inches. Steam hoisting works have been erected, and a pump is also worked by steam, as there is a great deal of water in the mine. The ore contains a considerable amount of sulphurets, but only the free gold is saved by the old style process used, an arrastra being employed for crushing the ore. Five tons of ore mixed with country rock (granite) was crushed recently and yielded \$430, or \$86 per ton. Sulphurets from the mine were assayed in San Francisco and went \$1600 to the ton. Mr. James is quite hopeful of the future of his mine, and of the White river district. He says that there are a number of mines in that vicinity, and that considerable work will be done during the winter, both in vein and placer mining.

## Tuolumne.

**WATER STORAGE.**—Tuolumne Independent, Oct. 16: It is unfortunate that the water storage in the mountains gives out at this season. A month longer of mining operations would help this part of the country wonderfully. If the upper reservoirs on the line of the T. C. Water Co.'s works could be made tight, it is said that an abundant supply would be had for a month to come. With the present structure, however, this would not be practicable, and the cost of a stone dam could not be thought of with the present revenue of the company. In the event of a railroad to this section, with the increase of population which would ensue, a stone dam would pay as a permanent investment, thereby insuring a full supply of water for mining and agricultural purposes all the year around.

## NEVADA.

## Washoe District.

**ALTA.**—Virginia Enterprise, Oct. 16: The winze and crosscut No. 2 on the 725 level is down 26 feet, all the way in good ore. Work is still being pushed in the upraise in crosscut No. 2, and is in quartz giving low assays and steadily improving.

**LADY WASHINGTON.**—On the 725 level the drift is out to the north about 75 feet, and the material improving, showing very nice quartz, with occasional streaks and spots of ore.

**BENTON CONSOLIDATED.**—The Keystone drift in Benton on the 725 level is running south on said level and is swung out of the ledge in very hard rock. There is no change in the mine from last week's report.

**CHOLLAR.**—No work at present is going on in Chollar, except preparing machinery and getting ready for the resumption of work in the old upper levels.

**CON. CALIFORNIA AND VIRGINIA.**—On the 1400 level, west crosscut No. 1 and west crosscut No. 3 have both been advanced some 45 feet. On the 1500 level the south drift corresponding with the south drift on the 1455 level in Ophir was advanced 30 feet. Ore from this mine has been shipped daily to the Morgan mill, the number of tons of which will be given to-morrow morning.

**HALE AND NORCROSS.**—All work for the present has been stopped in both Hale and Norcross and Savage, pending the stripping of the combination shaft.

**CROWN POINT AND BELCHER.**—The usual amount of work is still being carried on in the Crown Point and Belcher, and the usual daily shipment of ore to the mills on the Carson river being made. This shipment will be increased as the water in the river rises, allowing the mills to run all their stamps.

**GOULD AND CURRY.**—West crosscut No. 2 is still being advanced on the 600 level. The upraise above the 450 level in north drift No. 1 has been driven about 20 feet, making the total length 62 feet. This upraise is still showing streaks of good ore.

**SIERRA NEVADA.**—West crosscut No. 3 on the 520 level, started from the north lateral drift, is out 100 feet.

**UTAH.**—On the 472 level the west drift has been extended 40 feet, making the total length 84 feet.

## Eureka District.

**ORE SHIPMENTS.**—Sentinel, Oct. 16: During the past week ore shipments were made from the mines of the district to the two reduction works, as

follows: To the Richmond works—Weller and Dible mine, 2 tons; Williamsburg, 5; Members, 34; Marguerita, 3½; Marion, 1; White Pine, 6; War Eagle, 2½; Wide West, 4½; Reeves and Berry, 13; Silver Lick, 15. To the Eureka Con. Works—Eureka Tunnel, 4½; Geddes and Bertrand, 3; Lord Byron, 8; North Star, 2½; Rescue, 38½; Reveille, 2; Clark, 1; Branchi, 1; Norris, ½; Dunderberg, 23.

## Mt. Cory District.

**GOING AHEAD.**—Walker Lake Bulletin, Oct. 6: Geo. R. Wells, President of the Mount Cory Mining Company, has been here for a few days, looking over the progress of the renewed work. Under the experienced management of Superintendent Ballard, everything in the way of successful work has exceeded anticipation, and the company has every right to expect extensive profitable development. The new works are now under cover and sinking has begun. What experienced miners, formerly employed in this mine, know, justifies resumption of operations, and forms a good basis for reasonable expectation of large returns.

## Ophir District.

**BULLION.**—Belmont Courier, Oct. 16: The Chicago Mining and Reduction Company is sending forth a steady output of bullion from Ophir, and everything runs along smoothly under the direction of Superintendent T. A. Oliver. Ophir is one of the liveliest camps in Nevada at present.

## Pioche District.

**PROSPECTS OF THE DISTRICT.**—Virginia Chronicle, Oct. 16: Between the years 1871 and 1878 the Pioche mines paid out over \$4,000,000 in dividends. One mine alone yielded over \$15,000,000 in bullion. There was a very large population, and every man rated his labor at extravagant figures. Then came the inevitable relapse and the place was deserted. Now work is to be resumed by a company who have obtained 15,000 linear feet of picked property. The average value of ore previously extracted was \$100 per ton, and it is estimated that there is four times as much ore above water as was ever lifted. The country is so dry that the water level is 1200 feet below the surface. Much of the improvements are in excellent condition. A new mine has recently been discovered, the ore from which is said to assay high in silver and gold. A new and strong company is organizing for a thorough working of the great ore deposits of Lincoln county.

## Reveille District.

**BULLION.**—Eureka Sentinel, Oct. 16: The Gila Con. mine, of Reveille district, Nye county, shipped through Wells, Fargo & Co.'s express, yesterday, nine bars of bullion, valued at \$9290.

## Sacramento District.

**GOLD-BEARING LEADS.**—Silver State, Oct. 15: In Sacramento district, about 11 miles south of Rye Patch station, Robert Hope and Jack Bennett located two gold-bearing leads, the Tiger and Oro Fino, some years ago. The Tiger is opened to a depth of over 200 feet on the dip of the vein in two places some 200 feet apart. The vein is incased in syenite walls, and averages, as far as developed, about 20 inches in thickness. The Oro Fino is developed by drifts run on the vein several hundred feet, and its average thickness is about the same as the Tiger. The quartz carries gold almost exclusively, and several hundred tons of it have been worked by the owners in a small mill. They are satisfied that the ore would pay much better if concentrated, but they are now getting advanced in years, and prefer selling the property, or giving some practical men, who understand the business, an interest in it, for putting up concentration works. From the description given of the mines, they afford an opportunity for practical men to make a raise.

## Taylor District.

**REFUSED.**—Tuscarora Times-Review, Oct. 15: The Argus Company, of Taylor, has proposed to its discharged miners that they return to work for \$3 a day. The miners refuse to entertain the proposition until Joe Carothers, the superintendent of the mines, returns from the East, which will be in a few days.

## Tuscarora District.

**NEVADA QUEEN.**—Tuscarora Times-Review, Oct. 16: Articles were filed in the County Clerk's office of San Francisco, a few days ago, for the incorporation of the Nevada Queen, of this district, with the following officers: Directors—George W. Grayson, John F. Cassell, Steve Roberts, J. E. Dixon, and Geo. W. Hickox. Subsequently Geo. W. Hickox was chosen president; W. E. Deane, secretary; and F. F. Coffin, superintendent. The property of this company has become famous all over the coast through the recent Squabble Gulch litigation, now happily terminated between the May Queen and Nevada owners. The ground is known to be exceedingly rich, there being at least a half-dozen shafts upon the two locations, in every one of which pay ore was found. The superintendent, Mr. F. F. Coffin, an experienced miner, at one time a resident of this vicinity and who is familiar with the ores of this section, arrived last evening and will at once proceed to select a suitable location for a working shaft which will be commenced without delay. The erection of hoisting works will immediately follow, and Squabble Gulch will present a lively appearance before snow flies to any great extent. The mining outlook of this section has never looked brighter, even in the palmiest days of the Grand Prize, Belle Isle and Navajo, and the Times-Review hazards the prediction that the bullion shipments from the North Belle Isle and its immediate neighbor, the Nevada Queen, will astonish the world by their extent before the close of the coming year.

## Tybo District.

**WILL COMMENCE.**—Belmont Courier, Oct. 16: It is expected that work will soon be commenced on one of the Tybo mines by Eureka parties. There is a good chance for the profitable investment of capital in Tybo's mines. It is a wonder they have lain idle so long. Good mines seem to go begging while worthless ones attract the attention of capital.

## ARIZONA.

**GLOBE.**—Silver Belt, Oct. 12: The '86 mine, Mack Morris lode, and first eastern extension of the La Platta mine, in Richmond basin, is attracting attention in consequence of its recent extraordinary yield of silver. One and a half tons of ore milled 8580 ounces, of which one ton, belonging to Henry Risbridge, produced in silver 6700 ounces. It was

milled by Paul J. Johnson, and so cleanly done that an assay showed but one per cent in the tailings. Three and a half tons of Blue Cap ore treated by Johnson at the same time produced 440 ounces in silver. The Blue Cap joins the south line of the East Richmond and is a promising mine, as, indeed, are most of the discoveries in Richmond basin, the chief of which is the Mack Morris, which produced, during the three years the Mack Morris Company worked it, \$647,574.85. The sum total taken from it exceeds \$700,000, and had it been properly worked it would be a dividend-paying mine to-day. But the company was unfortunate in having a business man for superintendent who knew nothing whatever of mining. It consequently was butchered, the lead lost and pronounced worked out, which has since proved not to be the case. Miners who originally worked in it took leases, and have made money out of it and are anxious to renew their leases. It is above the water level and the ore is of an enduring character, argentiferous and antimonial sulphurets. The same thing can be said of the Stonewall Jackson, at McMillen. It is a big mine and equally as prolific in silver as the Mack Morris, but it also was unfortunate in not having skilled superintendents, who left the mine in so deplorable a condition that its owners were induced to cease working it. But with such a promising property it was not possible that it should be permitted to remain idle, and now it resounds with detonating powder and the sturdy thwacks of the hammer upon the head of the drill. The Howard, another valuable property, belonging to a Cleveland company, and practically abandoned, is also coming to the front, under the same management, but a different superintendent, who, at last accounts, had revealed a valuable bed of ore. Globe is not only a silver-producing district, but is also the best copper camp in Arizona, and no one has done as much as Dr. Alexander Trippel, superintendent of the Old Globe mine, who has established the fact that that mine has no equal in richness and quantity of ore. Nor is the Old Globe our only copper mine; there are others, if equally developed, would show a mine of wealth.

**SOUTHERN BELLE.**—*Arizona Star*, Oct. 9: Mr. E. Alvord came in from the Southern Belle mine. He says there are 20 men working for the company. The mill has 10 stamps, and chews up 30 tons of ore daily at 24 hours. The ore showing in the Southern Belle mine is good. There is a vast quantity of ore. Mr. Alvord says it is the best little gold mine he has ever seen in Arizona or California. The vein represents a blanket lead, and runs from 4 to 15 feet in thickness, and the gold is very evenly distributed through the entire vein.

**PIMA DISTRICT.**—*Tucson Citizen*, Oct. 6: Ham Light, of Pima mining district, Yuma county, informs us that there are in this promising district many high-grade strata and ledges, but none sufficiently developed to establish their stability. Messrs. Clay & Hyde, of San Francisco, are the principal operators there at present, and own some good mines, only one of which they are working to any extent. The Centennial mine will give an average of \$30 per ton, though there is much richer ore in small quantities. The camp lies 60 miles to the north from Centennial station on the Southern Pacific, and 25 miles from Cullen's Well on the Prescott and Wickenburg overland. The roads are reasonably good for a new country, and well supplied with wood and water.

**SILVER KING.**—*Pinal Record*, Oct. 11: The Silver King Co. received a sand crusher this week, which will be used for pulverizing some of the rich tailings that were saved several years ago. The company at that time did not have the proper machinery for extracting all the silver from some characters of their rich ore, and so the tailings were saved to be worked over again. These tailings contain anywhere from 40 to 75 ounces per ton. When this ore was being worked in the first place the company never failed to pay a regular monthly dividend of 25 cents per share, therefore the ore originally must have been very rich.

**SILVER THREAD.**—*Tombstone Democrat*, Oct. 15: A reporter of the *Democrat* was yesterday shown some ore taken from the Silver Thread mine, owned by Charley Leach and others. The sample was taken from the 100-foot level, where a body at least 15 feet in width has been struck. It is not high grade, averaging only about \$50 in silver, but the large body will make up for what it lacks in richness.

## COLORADO.

**LAKE COUNTY MINES.**—*Leadville Herald-Democrat*, Oct. 15: The Clark shaft on the Chrysolite has entered the dolomite sand belt. The Tip Top mine has declared another dividend of \$16,000. The northern portion of the Smuggler lode will probably be leased in a few days to parties who will thoroughly develop it. The Harrison reduction works is still confining itself to three furnaces. The stock of ore on hand is slowly increasing. The Best Friend mine, at the head of Big Evans gulch, is stopping and sacking ore. A shipment of rich mineral will be made in a few days. Three or four lessees are working the Argentine property, on Iron hill, and moderate shipments of fair ore are being made from time to time. Captain Blaisdell and others, working properties on the Mosquito range, north of the Continental Chief mine, are encountering good indications of a large ore body. A number of the smelters are laying in a supply of fire clay for the winter months. The source of supply is in Big Evans gulch, where a six-foot vein has been opened, yielding clay of superior quality.

**SMELTING CHARGES.**—The Iron Mask mine, of Red Cliff, has temporarily suspended ore shipments to Leadville smelters. Mr. Lay, the manager of the property, was in the city a few days ago soliciting bids, but failed to receive any that met his approbation. It is reported that he has since declared that he would shut down the mine before he would pay the prices at present demanded by Colorado smelters. Mr. Lay's experience at mining is rather limited or he would not make such assertions. Owing to the competition between Leadville and Pueblo smelters he had his ore treated for some time past at far less than cost. This unnatural contest for supremacy in the smelting field has closed down one of the competing works, and smelting at less than cost has ceased. So long as the prices charged are not exorbitant, and they are much lower in Colorado than in any other place in the world, no one can find fault, and the miner that objects to paying present

rates certainly cannot be informed on the cost of reducing ores. A mine that cannot be operated at present with all the existing favorable conditions to assure success and profit can never expect to be a very profitable one.

**GEORGETOWN NOTES.**—*Georgetown Courier*, Oct. 14: Evans, the sailor, has struck it again. He has a three-inch vein of ore on Irwin's Peak which will mill about \$1000 a ton in silver. The drift on the Crown Prince shows from 4 to 5 feet of ore which runs well in gold. A very fair vein of ore has been opened in the Gold O. K. lode, which mills 16 2-10 ounces gold and 30 ounces silver per ton. Work will soon be resumed on the Michigan tunnel to cut the Warsaw lode. A discovery is reported on McClellan mountain which turns out 1988-ounce ore. Carl Anderson is taking 250-ounce ore out of the Graymont lode. He has from 6 to 24 inches of it. Taylor & Co. have a very good vein of ore on the Dunderberg, which mills in two classes—300 and 184 ounces. Southward & Thomas report a fair vein of ore on the Eagle Bird, which mills 515, 212 and 96 ounces, according to class. The County Treasurer lode, West Argentine, is improving in quantity and quality. Last mill-run, 700 ounces per ton. John Sopp, lessee on the Dunderberg dump, shipped about three tons of ore last week which returned \$16 in gold and 120 ounces silver per ton. The output of the Jo Reynolds mines for September was \$6620.67 net. The Freeland made an output of \$24,883.40 during September, \$20,808.55 of which was gold, \$3954.53 silver and \$120.32 copper. The product of the Plutus for September was gold, \$3930.71; silver, \$2902.47; copper, \$111.17; total, \$6944.35.

## DAKOTA.

**DRIFTING.**—*Black Hills Tribune*, Oct. 16: The pump in the Seabury-Calkins has been lowered to the 200 level. Drifting will recommence on the 160 level at once. The new hoists on the Eureka and Empire mines at Carbonate will be ready for operation in a few days. Both mines are of promise, and we hope with the aid of their new machinery they will rapidly develop bonanzas. Four bricks were brought from the Iron Hill last evening. They weighed 3837.60 ounces. This is the first shipment this month. There is now in Deadwood about \$5000 worth of base bullion which still continues to come in. Shipments to Omaha will shortly commence.

## IDAHO.

**FURNACES.**—*Ketchum Keystone*, Oct. 12: The furnace of the Philadelphia Company was yesterday closed down temporarily. The roasters will be kept going. W. T. Popham has purchased the Ava mine, on Boulder mountain, from T. Lavell and Jack Cochran. The claim will be thoroughly prospected, and with the little work already done, an ore streak nearly a foot wide has been found. J. B. Reiff, Supt. of the Falls City M. & S. Co., has 10 men at work on mines on Boulder mountain doing assessment work. The company owns the Moosehead, Leviathan, Copper Queen, and other mines in the locality.

**ATLANTA.**—*Idaho Statesman*, Oct. 15: The old mining town of Atlanta is almost abandoned. The 13 business firms which existed there six months ago are now reduced down to one solitary saloon-keeper. Less than 50 persons will winter there, and these simply to care for the expensive mining works which stand as idle monuments of a once thrifty town. Yet there are scores of "old-timers" who believe the mines of Atlanta exceed in value those of any other town in these mountains.

**CAMAS, No. 2.**—*Virginia Enterprise*, Oct. 13: The Camas, No. 2, mining property, on the Gold Belt, in Idaho, is yielding steadily, but they are under disadvantages, owing to the small supply of water. Arrangements are going on, however, for a larger supply, at which time the yield will be considerably increased. The mine yielded \$5000 during July, \$3600 in August, and during last month \$3000. It has been satisfactorily shown that with the proper amount of water a yield of \$50 per battery can be made. The mill is now running but five stamps a day, which would bring the yield up to over \$200 per day, at a cost of about \$70, but a larger number of stamps will be started without increasing the expense.

**THE GOLDEN CHEST.**—*Cœur d'Alene Record*, Oct. 6: Yesterday a *Record* reporter was informed of a very rich strike that had just been made at the Golden Chest. Ever since Supt. Pettit's return from the Hailey convention he has been busy making assays at the company's office. The returns were very flattering even before the last strike, which is said to be a two-foot vein of very rich free milling ore. Several assays already made have run from \$500 to \$1000 per ton. The superintendent is a thorough miner and a practical, conservative man, and when he advises the company to get additional machinery needed, and put the mill in proper working order, it may reasonably be taken for granted that there is good ground for the belief that the Golden Chest mine is very valuable property.

## MONTANA.

**MILLER AND HENDERSON MOUNTAINS.**—*Cor. Butte Miner*, Oct. 18: The first location we came to is owned by Frank Essler, and is called the Big Blue. This is a galena deposit and carries a small amount of silver, and is a fine ore to mix with the Republic ore. The next visited was the Little Judge, owned by Sanborn & Co., a nice prospect. This does not carry quite enough lead to be as useful as the former mine, but carries more silver. The Shoo Fly is owned by Horn, Miller, Pike, Moon and Major Pease, and is now working under bond and lease to Messrs. Gassett, Black & Co. They are working quite a crew of men and are taking out some very fine ore. They are also operating the Old Bozeman Co.'s smelter under a lease and then treat the ore from the Shoo Fly and also the Black Warrior, which they own, and is one of the finest properties in the camp. It is up close to the top of the range and is being rapidly developed through a tunnel and some three shafts. At their upper shaft on the top of the divide they had some of the largest prospects that have ever been assayed in the Territory, going nearly \$30,000 to the ton gold and silver. They are now doing the most of their work through the tunnel, as that strikes their ore body

100 feet lower than at any other point, and an air connection has been made through to the shaft workings, and they are now getting it in good shape to take ore out as fast as they may want it. This company had a lease of the old smelter that was built here by the Bozeman Company, and have been actively operating it all season, but just at present have shut it down and are arranging with the company to put in an improved water-jacket furnace in the place of the old one. The Homestake, on Henderson mountain, is one of the largest properties in the district, and is really a mine without being developed, as there is a much larger body of ore in sight on top of the ground than the owners of many paying mines have after years of work. This mine is now under bond to the Republic Company for \$100,000, six months' time, and as most of that will be winter, they will no doubt make their final decision much earlier. It is owned by Messrs. Mather, Smith and others. The Daisy, close by this location, is very similar in quantity and grade, and is owned by Kearns & Brownser.

## NEW MEXICO.

**ADDITIONAL STAMPS.**—*Silver City Enterprise*, Oct. 11: The framework for the additional 20 stamps of the Carlisle Co.'s mill is being put up, and the machinery will very shortly begin to arrive on the ground. Everything is expected to be in working order by Jan. 1st, though the bad weather may delay the completion beyond that date. The addition is to be an exact duplicate of their present crushing and concentrating plant, the balance of the works being of sufficient capacity to accommodate the 40 stamps. Money has not been spared at the expense of labor and convenience by this company, and they will unquestionably have the finest and most complete mining plant in the Southwest when the new mill is finished. The greatest credit is given to Mr. Huntley, the superintendent and manager, for the success he has achieved in this camp, as he has been restricted by the company to the profits of the mine, after paying the usual dividends, for funds to carry on the necessary improvements, and yet has a considerable unappropriated surplus in the treasury. The mine has not lately changed in appearance, except that the ore bodies have developed in extent beyond the expectations of any one connected with the property. The working shaft is down something over 400 feet, with no change in the character of the rock, while work on the 160-foot and 300-foot levels has proved the ore body to be more than 45 feet in width and the first wall not yet found. The 160-foot level has been run west about 1000 feet on the ledge, and a force of men is still working in the face of the drift. No waste rock is handled, and the 12 or 15 miners employed on the day shift take out sufficient ore to keep the mill going, making it unnecessary to do any night work. From 50 to 60 tons of ore are concentrated every 24 hours, and the concentrates shipped to market either in San Francisco or Kansas City. The mill may be closed down for a time inside of the next two months, pending the completion of the new machinery, though a small force of men will be kept in the mine to get things in shape for the vigorous work of the coming year.

**WHITE OAKS.**—*Cor. Socorro Bulletin*, Oct. 18: The two stamp mills of White Oaks are running in good order, the new mill on South Homestake, and the Glass mill on North Homestake ores. The last mill-run at the latter mill gave \$2080 for 80 tons of ore. New mines are being opened, and it is expected that the Delaware gold mill will soon be in operation. The litigation about the Little Mac mine will soon be settled, a patent having been applied for. The Rita, Old Abe, Little Homestake and other mines are being developed, and show visible gold with a nice body of ore. What we miss is a railroad. Our stage communications are very poor; our coal and iron mines are of little value yet.

**SOCORRO.**—W. M. Glasson has resumed work on his Jordan Canyon gold claims. J. B. Rosebloom, of Kelly, was in the city recently. He is working his Jumbo claim, and dumping pay galena and cerussite ore. Dale Brothers are in 80 feet on their tunnel in Brush canyon. At that point they are taking out pay argentiferous galena from a vein two feet in width. The Graphic smelter is to have its capacity increased immediately by the reconstruction of the old No. 3 stack. The castings are on the way, and this will materially augment the bullion production of this city. The Graphic smelter is being improved by the addition of a desulphurizing furnace. It is being constructed of bricks made from slag, according to specifications and original plans of Mr. Reese, the superintendent of that plant.

## OREGON.

**QUARTZ AND PLACERS.**—*Jacksonville Times*, Oct. 15: Miners are generally getting ready for winter. John Lewman has struck excellent prospects in his quartz mine on Applegate. John O'Brien is making extensive preparations for placer mining in the Steamboat district. Sherrer & Judson, of Grant's Pass, are manufacturing hydraulic pipe for the California Co. and John Aden. Some promising nickel ore has been discovered in the vicinity of Eight-dollar mountain, Josephine county. Fisher & Stuart, who wing-dammed Rogue river, have ceased operations, their enterprise not proving remunerative. Baume, Klippel & Co. are at work on their quartz ledge, which promises well. Their mill will be in operation soon. Messrs. Maloney & Harkness, who own excellent placer mines on Grave creek, are negotiating a sale of them to parties from the East. Anton Rose informs us that work on the tunnels being run into the Green ledge on Galice creek is still going on and rapid progress is being made. The proprietors of the Hope ledge on Wagner creek made a cleanup a few days since and realized \$1632 from 100 tons of ore, which is a first-class showing. Jesse Huggins and Mr. Jensen are now engaged in cleaning out the shaft and otherwise improving the Jacksonville Milling & Mining Co.'s property on Timber Gulch. Brown's mill will be in position near the Swinden ledge in a few days, when operations will be commenced. Silas J. Day will sell the stock in the Jacksonville Milling & Mining Company, upon which the assessments are delinquent, on Nov. 13, 1886. Only two shareholders are delinquent, however. About 77 men, including 30 Chinese, are engaged in digging a ditch for

the California Company near Kerbyville, nearly one-third of which—about five miles—will soon be completed. This will enable them to do some work during the coming winter; but the ditch will eventually be 18 miles long. R. J. Cameron informs us that considerable preparation is being made for winter in the mines of Uniontown precinct. Gin, Lin & Co. are putting in new flumes at their hydraulic mines. Haskins & Co. are rigging up the Chappel diggings, and others are busily at work getting ready for the wet season. F. Clarno reports that a new and rich strike has been made at the Queen Mountain mine, Starveout, in the Cow creek district, Douglas county. A new tunnel, No. 3, has been run in the Green Mountain mine and the north extension which, at a depth of 20 feet, struck rock as rich as any yet discovered in that vicinity. A party who took up the second south extension began work with pick and shovel, and getting tired, borrowed a stick of giant powder and blew out some very rich rock showing leaf gold. The ledge is nine feet wide, and there is great excitement over it, and claims are being taken up for miles.

**PLACERS ON BURNT RIVER.**—*Bedrock Democrat*, Oct. 11: Messrs. G. W. and Z. A. Tucker and E. Henderson, of Huntington, discovered some very rich placer diggings recently on Burnt river, about two miles west of Huntington. They are using concentrating boxes, which is considered the best process for catching the fine gold. These gentlemen yesterday located 80 acres of this auriferous soil and intend to work it for all it is worth. The only drawback is water, and if they succeed in putting the proposed ditch through, they will, no doubt, have a sufficiency of water. To accomplish this it is necessary for them to organize a joint stock company. They will doubtless have no trouble in doing this, as every practical miner who has seen the ground thinks that the gentlemen have the richest placer diggings in that part of the country. It is beautiful looking dust and goes \$18.75 to the ounce. Mr. Tucker gave us a pleasant call yesterday. He seems to be fully confident in having one of the best pieces of placer ground in the country.

## UTAH.

**REVIEW.**—*Salt Lake Tribune*, Oct. 15: The week has been a fair one in mining activity. Ore has been coming in freely, and the bullion shipments have been a good average. At the same time, the shipments of ore abroad have fallen off considerably from the maximum of awhile back, and indications are that the product is being more nearly worked or stored at home than before. The receipts of the metals in this city for the week ending Oct. 13th, inclusive, were \$188,131.66, of which \$127,476.55 was in bullion and \$60,655.11 was in ore. For the previous week the receipts were \$86,428.83 in bullion, and \$85,583.71 in ore, a total of \$172,012.54. The output of the Ontario for the week was 14,108.62 ounces of fine bullion, and \$17,145.62 from ore sales; an approximate total of \$31,254.24. The Daily product for the week was 7634.59 fine ounces; no ore sales. Fine bars received during the week aggregate a value of \$37,605.82; base bullion, \$12,400. The Stormont sent up, on the 7th, silver bars to the value of \$4035. The product of the Hanauer for the week was \$27,230 in bullion. The Germania is undergoing repairs and is shut down for the purpose. Ore receipts were—by Wells, Fargo & Co., \$18,000; by McCormick & Co., \$26,790, including \$2000 Overland ore and \$5190 Queen of the Hills; by T. R. Jones & Co., \$10,425.89; by the Union National Bank, 16 lots, \$5439.22.

**BULLION SHIPMENTS.**—*Park Record*, Oct. 9: The early part of the week Freighters Drew and his teams were engaged hauling a carload of iron water-piping up to the Crescent mine. The water is to be piped from the head of Thane's canyon to the mine for the boilers, etc., and no freezeup will occur this year. Considerable inconvenience is met by the Crescent folks and by the Mackintosh sampler hands on account of the inability of the railroad company to furnish regularly sufficient cars for shipping ore and concentrates. The Morgan shaft has attained a depth of over 60 feet already, and sinking is going on with rapidity. The Crescent and Daly companies paid their employees about the middle of the week. Ontario payday is expected to occur within a day or two. For the week just ended the Mackintosh sampler received \$84,180 pounds of Ontario ore, 79,380 pounds of Daly, and 64,490 pounds of Sampson ore; total, \$28,050 pounds. The Daly bullion product from the Marsac mill was seven bars, on the 6th, containing 6031 fine ounces of silver, and yesterday the shipment was eight bars.

**PARK CITY.**—*Record*, Oct. 16: At all the principal mines around Park City the usual preparations for winter have been going on. At the Ontario and Marsac mills several thousand cords of wood are piled up, and this supply of fuel will last many months, while at the mines any quantity of lagging, stope timber and timbers for general use are on hand, calculated to fill the demand till next spring. Other preparatory work for winter is observed all around, and little else will be required to carry on active operations at the mines almost without any interruption during the entire winter.

**DOINGS AT THE MORGAN.**—The two-compartment shaft of the Morgan is down over 70 feet. The boarding and lodging house is about completed, and it will accommodate 50 men. A powder magazine and other necessary buildings are in course of erection, and the water service has been brought to a high degree of efficiency. About 20 men are employed on the Morgan group, and work will go ahead all winter.

**ANCHOR IMPROVEMENTS.**—Thursday afternoon the set of two large boilers arrived from the East, and to-day they were hauled up to the mine to be put in position. Twelve men are employed, and the mill for sawing timbers is about finished. By November 1st, it is thought everything will be in readiness to start up active operations. The force will then be increased.

**ORE AND BULLION SHIPMENTS.**—For the week just ended the Mackintosh sampler received 424,860 pounds of Ontario ore, 43,200 pounds of Daly, and 21,490 pounds of Sampson ore; total, 489,550 pounds. The output of Daly bullion from the Marsac mill for the week was 8 bars, containing 7686 fine ounces of silver. The Ontario bullion product for the week was 22 bars, containing 12,697.75 fine ounces of silver.

JAMES' PATENT ORE CAR.

Saves a Higher Percentage than any other machine. Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the **WHOLE WEIGHT and FORCE OF BLOW ACTS ALTERNATELY ON EACH DIE**. In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

## THE JAMES QUARTZ MILL

Saves a Higher Percentage than any other machine.

Its action is a reciprocating motion of four separate and distinct Dies attached to a heavy casting in such a way that the **WHOLE WEIGHT and FORCE OF BLOW ACTS ALTERNATELY ON EACH DIE**. In this respect it resembles the Stamp Mill, and in point of amalgamation is superior to any machine in use. There is no wear, except on Shoes and Dies, and there is no expense for setting. Weight, 3000 pounds. Capacity, 6 Tons in 24 hours through No. 40 Screen. Requires 4 H. P.

This cut represents our

## IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

HOSKIN & CO., Marysville, Cal.

## THE IMPROVED FORM

—OF—  
SINGLE-JOINTED

## HYDRAULIC GIANTS.

We are now in the field as manufacturers of SINGLE-JOINTED HYDRAULIC GIANTS, and are prepared to furnish the several sizes with quick dispatch, and they will be found to be the equal of, if not superior to, a similar form ordinarily known as the Marysville Nozzle, and will quote prices upon application.

## Dr. Pierce's Electric Belt.

This small truthfully exhibits the **Crandest Medical** of the 19th century. By means of this BELT the human body is supplied with a continuous current of Electricity. It relieves and cures, without medicine, all diseases and weaknesses of male or female, that can possibly be relieved or cured by Electricity and Magnetism. Dr. Pierce's Belt is the only one which will produce electricity with or without acids; giving when charged a current of high tension, which can be instantly felt by the wearer. Contains all the latest improvements, including an improved **Electric Suspensory for Men**. In fact it is warranted to be the only complete and durable **GALVANIC BODY-BATTERY** ever invented. Satisfaction guaranteed. Prices very reasonable. **Call or write for our FREE descriptive pamphlet, No. 2.** **MAGNETIC ELASTIC TRUSS CO.** 304 N. SIXTH ST., COR. OLIVE ST. LOUIS, MO. and 704 SACRAMENTO STREET SAN FRANCISCO, CAL. AGENTS:—PETER VAN SCHAAK & SONS, 138 & 140 Lake Street Chicago, Ill.; M. W. ALEXANDER, Druggist, Fifth & Olive sts., St. Louis Mo.; J. H. WIDBER, Druggist, 3d & Market sts., San Francisco. **RUPTURE** Quickly cured! If ruptured send for our Pamphlet No. 1.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep places, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## A Good Opportunity for a Machinist.

A variety of good Tools, Patterns, etc., with business for sale cheap by a party retiring from business. A splendid opportunity for an enterprising mechanic.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

## Centrifugal Pumps and Draining Machinery.

(Written for the Press by J. RICHARDS.)

NUMBER 5.

Another feature that has retarded or misdirected practice in centrifugal pumping is the want of uniformity in the working conditions and variation of circumstances under different heads. In all other kinds of pumping, the operative conditions, except resistance, are nearly uniform at different heads; but with centrifugal pumps there is no rule of the kind.

The factors of effect, to so call them, are centrifugal force, and what, for want of a better term, we may call "impact," or the mechanical "push" of the vanes. These two separate forces come into play in varying relation as the head, or as the relative speed of the water and wheel, which is the same thing; hence there is no uniformity.

A pump working against a head of 50 feet operates almost exclusively by centrifugal force, while one working against a head of five feet may operate mainly by impact, or, to express it in other terms, like a turbine water-wheel reversed.

These conditions qualify the form of the vanes which in one case may move ten times as fast as the discharge water, and in the other case almost at the same speed; one case calling for tangential tips, the other for straight radial vanes.

The velocity of the wheels conforming to the law of falling bodies while the flow of water is constant, calls for a continually varying construction suited to different heads, and has led to much of the modification and contention that has attended on this manufacture.

A recital of these difficulties may seem a contradiction of the propositions contained in the first part of this chapter, but they are not. They are all subjects to be dealt with by computation, and would be, if once taken up by our able engineers and scientists.

In proof they have not been, I will revert to my last proposition respecting the variation between centrifugal and direct force, and between the velocity of the wheels and the water, with the change of form these circumstances demand.

In such pump literature as has come under my notice, there is no dealing with these matters—the very first to be considered, and without which there can be no useful rules for construction.

By the force of repeated and prolonged experiment, extending over 60 years in all, or 40 years of active practice, we have arrived at a tolerably-settled form of construction for centrifugal pumps—that is, have reached a kind of standard, with a few of the best-informed makers.

Of empirical practice we have enough yet. The struggle for single inlets still goes on, and is often adopted without knowledge of the consequences it produces when a disk-wheel is employed.

We have tables that give the proper diameter of wheels for a certain duty, ignoring pressure and speed, and, worst of all, a continued search for some new way of constructing machines that have generally given a duty inverse as the amount of complication and detail.

I have not thus far said anything of French practice, and must confess to some prejudice in the matter because of certain reports made about the year 1866, respecting the competitive working of some Gwynne pumps with those made by M. Coignard, of Paris. The Gwynne pumps were set down as working at a duty of 35 per cent, while the Coignard pumps realized near double the same effect. Looking at the construction in the two cases, and making such deductions as a fair inference would afford, I concluded the report was of no value and its statements impossible. I moreover believed the Gwynne pump superior to any made in France, if we except those which are copies, one of which I recently examined at New Orleans.

French engineers have developed a good deal in compounding pumps, and, I believe, first invented the double wheels or multiple wheels, one discharging into another, to be used in the case of high heads. I am not sure, however, whether Mr. Gwynne's compound pumps were first proposed or not. It is not a matter of much importance either way, because, all things considered, is is doubtful whether compounding is a construction to be recommended beyond certain exceptional cases.

The problem involves questions not answerable by computation. It is one of mechanism and endurance, which future experience must determine; so that if added by our French friends to modern pump practice it must stand as a feature of questionable value.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Academy of Sciences.

At the meeting of the California Academy of Sciences on Monday evening last, President Davidson read a brief account of the recent volcanic eruption of Pabloff, Alaska, and exhibited several specimens of the volcanic dust.

Dr. Behr presented two neuropterous insects, related to the Termites or white ants, giving an interesting description of their structure and habits, especially in regard to the appearance of one of the species some two weeks before a rain-storm.

This latter statement elicited some discussion. Prof. E. S. Holden was anxious to know whether the presence of these insects really predicted a rainstorm, or whether there were other circumstances which led to their appearance. The subject was discussed by Prof. Holden, Mr. J. T. Evans and Dr. Gibbons. Dr. Behr stated that, according to his best observation, the facts he had stated were correct.

Papers were read by title, "Descriptive Notes of North American Coleoptera," by T. L. Casey; "The Landfalls of Cabrillo and Farrello, 1542-1543," by George Davidson; "Early Spanish Voyages of Discovery on the Coast of California," by George Davidson; "Velocity and Direction of the Gulf Stream between Fowey Rock, Florida, and Gun Cay, Bahamas," by F. M. Thorn, Supt. U. S. Coast and Geodetic Survey. Prof. Davidson also read a paper on "Determination of Standard Geodetic Data for the Computation of Geographical Positions on the Pacific Coast." President Holden testified to the great accuracy of this work and the advantages it gave to those who required exact geographical position.

Papers were announced for the next meeting by Dr. Behr and Walter C. Bryan.

W. A. Goodyear, formerly of the State Geological Survey of California, and afterward Government Geologist of Salvador, read an extended and interesting account of the series of great earthquakes which occurred in Salvador in 1879-80. There were nearly 400 earthquakes in a few days, many of them very severe. Great landslides occurred, fissures opened, and the flow of water in streams and lakes accelerated. Mr. Goodyear described many of the details, he having been specially instructed to make observations of force, direction and character of the shocks. He related the fact that there was not wanting a local Wiggins to predict all kinds of dire disaster, which very much frightened the whole population of the country, and even the President himself. For several days this man kept the people terrorized, until it was found out in the end that he knew no more than any one else. Mr. Goodyear himself was importuned by the President to give an opinion of the man's predictions, and repeatedly stated that he could have no foundation for exact prophecies, although in a country thus badly disturbed almost anything might happen.

Dr. Harkness, at the close of the meeting, exhibited under the microscope two new species of fungi described by himself—a new *Ustilago* and a *Testalozzia*.

## Mining Share Market.

For the past day or two mining stocks have been rather active, contrary to what was supposed would be the case when deep prospecting was stopped on the Comstock. This is rather an agreeable surprise. The *Virginia Chronicle* asserts that explorations near the Con. California and Virginia north line, in the Ophir ground, indicate that there is a large body of low-grade ore in the latter mine between the 1300 and 1800 levels. Ore is being extracted from below the 1850 level in the Con. California and Virginia, and future explorations will doubtless demonstrate that the deposit which has shown a depth of more than 700 feet in the California and Con. Virginia old stopes will be found of equal dimensions in Ophir.

The rapid advance in Ophir and Con. California and Virginia is due to the fact that they are now hoisting from the 1300 level south drift of Ophir, running into Con. California and Virginia ground, large quantities of low-grade ore, giving assays of increased value. The ore from that ground is being shipped daily to the Eureka mill, on the Carson river, which is now running all its stamps.

The advance in the middle stocks is, beyond a doubt, due to the fact that the mines will now be worked for all they are worth on the upper levels, and that the shutting off of the water and reduction in the consuming of ice, wood and other materials will also lessen the amount of assessments fully one-half.

## MEETINGS TO BE HELD.

NAME OF COMPANY.	LOCATION.	SECRETARY.	OFFICE IN S. F.	MEETING.	DATE.
Contention Con M Co.	Arizona.	D. C. Bates.	309 Montgomery St	Annual.	Oct 25
Kincaid Flat M Co.	California.	Called by Trustees.	432 California St	Special.	Nov 1
North Belle Isle M Co.	Nevada.	J. W. Pew.	310 Pine St	Special.	Nov 3
Pittsburg M Co.	Nevada.	C. J. Bandmann.	30 California St	Annual.	Oct 28

## LATEST DIVIDENDS—WITHIN THREE MONTHS.

NAME OF COMPANY.	LOCATION.	SECRETARY.	OFFICE IN S. F.	AMOUNT.	PAYABLE
Martin White M Co.	Nevada.	J. J. Scoville.	309 Montgomery St	30.	Oct 11
Paradise Valley M Co.	Nevada.	W. Letts Oliver.	323 Montgomery St	20.	Sept 30
Silver King M Co.	Arizona.	J. Nash.	328 Montgomery St	25.	Aug 16
Young America M Co.	California.			40.	May 20

## Microscopical Society's Reception.

The reception given by the San Francisco Microscopical Society at Pioneer hall, on the evening of Oct. 16th, was probably the best of a long series of entertainments given by the society. There were more instruments than the society ever before mustered, and some of them of the very latest patterns. The choice of objects was very heavy; not too profound to please the popular observer and yet deep enough to warrant the gaze of the skilled microscopist. There were nearly 50 microscopes on exhibition. The audience included some of our best people, and both the scientific and social features of the reception were generally enjoyed.

Dr. C. P. Bates gave an exhibition of living pond organisms, showing some of the forms of minute animal life that may be found in our ponds and reservoirs. The general and capillary circulation of the blood in frog's mesentery was well shown by Dr. J. M. Selfridge. George C. Hickox gave an exhibition of the wonderful behavior of metals crystallizing from solution by the battery process, passing a stream of electricity through a solution, resulting in forms somewhat different from those occurring in nature. E. J. Wickson gave an interesting exposition of the different scale insects, showing them in various stages of development, from the egg to the full-grown insect. The exhibit was of special importance, because of the great injuries being done by these pests to the fruit interests of the State.

A. R. Breckenfeld, secretary of the society, showed some of the wonders of animal life, his young oysters rolling in fluid (polarized light) being considered one of the most beautiful objects on exhibition. C. W. Banks had a comprehensive exhibit of attractive objects, the most remarkable being the electric spark as shown under the microscope. Dr. J. H. Stallard followed his natural inclinations in the demonstration of pathological preparations, to which he has given much study. William Payzant exhibited eggs of the house fly and living brine shrimp (*artemia salina*); W. F. Myers exhibited male and female mosquitoes; L. M. King living rotifers (sacculinaria socialis); A. S. Brackett showed cocaine and its salts, the new preparation showing marvelous forms of combination; Professor H. G. Hanks exhibited insect in amber. The exhibition of Henry C. Hyde was specially interesting, because of the use of the electric light as an illuminator for the microscope.
